A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LX FORT ATKINSON, WIS., JULY 23, 1920. Number 1

Curing Alfalfa for Dairy and Beef Cattle

GEORGE STEWART, Utah Experiment Station

THE great intrinsic value of alfalfa hay for dairy and beef cattle may be considerably enhanced by wise handling and proper curing. Probably no other crop is so sensitive with respect to quality as alfalfa when curing methods are concerned. Certainly none is more so. The fact that three or more cuttings instead of one constitute the yield is a large factor in making this true; but it is not the only factor, by any means.

Not only does the time of cutting affect the total yield of hay by regulating the growing period of each cutting, but it also regulates, to a surprisingly great extent, the relative content of protein, fat, fiber, and ash. Exposure to sunshine and rain permits loss in soluble food nutrients, especially in protein. Color and aroma in the hay, both vital to highest palatability, may be either lost or preserved according to the way in which the hay is handled after cutting. Important, however, as are all these factors on the final quality of the hay, the loss or preservation of leaves is of still greater importance. In the leaves is the greater percentage of protein, fat, and ash, and also the most palatable part of the hay when cattle at least are concerned. Method of curing has almost entire control over the proportion of leaves that is lost or saved. It is apparent therefore that the time of cutting and the manner of curing alfalfa are of such great importance as to be vital.

Time of Cutting

Two experiment stations have made a rather exhaustive study of the stage of growth at which it is most profitable to cut alfalfa for hay. Kansas found that it was slightly more profitable when only the yield was concerned to allow the crop to reach the stage of full bloom before cutting. This slight increase in yield was more than offset by a decrease in palatability when blooming was permitted to advance beyond the early stages.

It was further found that if alfalfa was cut just as soon as any blossoms appeared that the protein content was approximately 14 per cent, whereas if allowed to pass to full bloom and let a few seeds begin to form the protein content was only 11 per cent. This is a loss of more than 20 per cent of the most valuable food constituent. The protein content of the leaves decreases from 28 per cent at the beginning of bloom to 24 per cent at the end.

Utah Station results are similar except that early cutting was found to increase the yield as well as the quality of the hay. Early, medium, and late cuttings were found to yield in the proportions of 100, 92, and 85 respectively. The yields in pounds to the acre were 10,719, 9,829, and 9,100. The feeding value of the hay in this experiment was measured by the quantity of beef produced. The relative value of the acre-yield of beef when the hay was cut early, medium, and late was 100, 79½, and 69½ respectively. Not only was the yield increased by early cutting but also the value per pound. As an average for five years, in order to produce one pound of gain, it required 16.82, 22.07, and 28.02 pounds respectively of early, medium, and late cut hay. These relative values are here shown beyond question.

In damper regions, or even in wetter seasons of the drier sections, alfalfa does not bloom readily. In such cases, it is counted best to watch for the young shoots and cut just as soon as they are starting new growth. When late cutting is practiced these new shoots would probably be advanced far enough in growth for the mower to cut them back.

Finally, it must be borne in mind that very early cutting, that is one, two, or three weeks before the first blossoms or the first new shoots appear, not only gives a low yield of poor quality, but weakens the plants and allows weeds to get started. Kansas found barley-grass (fox tail) to increase much more rapidly in alfalfa fields that were cut extremely early.

Method of Curing

Method of curing has much to do with the preservation of aroma and the avoidance of dust or mold. Certain factors are beyond the control of the farmer, such as unexpected showers, for example, but in the main curing depends rather on the idea of the man who is handling the hay than on unavoidable weather conditions. If the grower understands two things and the reasons that lie back of them he is much more likely to make first-class hay than would be the case otherwise. These two facts are (1) that alfalfa ought to be cured slowly and so far as possible in the shade and (2) that the quality of alfalfa is easily injured after curing has begun by undue exposure either to sunshine or to rain.

Curing in the shade means that drying should be done rather gradually and by means of air rather than sunshine. This relates mainly to saving the leaves, because rapid drying at first is the way in which leaves are lost. A brief glance at the structure of the stem and leaf will give considerable assistance in understanding just why this is the case. It should always be borne in mind that a plant is alive at the time of mowing, and that moisture is therefore passing rather rapidly from root to leaf and is there being largely evaporated —"transpired", the botanist says. Somewhere between 600 and 1,000 pounds of water are passed through the plant and evaporated away by the leaves for each pound of growth made by the plant.

The mere cutting off of the stems of alfalfa near the ground in no wise kills the plants. It merely severs its connection with the root; that is, the source of the stream of water is cut off. If exposed to rapid drying the plant is unable to keep up a flow of water through to the leaves because the slender leaf stems dry out to such an extent that they cease to function. The leaves and the main stem of the plant are so comparatively coarse that they may still be moist when the leaf petioles are dry enough to become brittle. This is the principle that lies back of the loss of leaves in rapid drying.

Sometimes—rather generally, in fact—moisture reduction is really retarded by very rapid drying at first. The leaves are mechanically good ex-

(Continued on page 8)

ALFALFA BEING COCKED CLOSE BEHIND THE MOWER
This hay was cured partly in swath, partly in the windrow, and partly in the cock. About one-third of the leaves were lost.

ALFALFA IN THE IRRIGATED REGION
The leaves have just wilted and therefore will not drop off. The ground is drained; no hay spoils and all leaves are saved. No bleaching takes place.

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in copy. vertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

How to Restore Damaged Pasture

Many Minnesota farmers were forced in the spring to turn their stock out to pasture early notwithstanding the fact that grass started slowly. The effect of this early pasturing may be seen now in short pastures which, in some sections, are being burn out. A pasture that is grown close during the early season is sure to go into the hot weather of summer in bad condition. The roots of the grass are not protected by the leaves and blades as they are intended to be and evaporation from the soil is rapid and the roots are usually badly damaged. In such condition grass can make but little growth.

Andrew Boss, veteran farm manager with the Minnesota Experiment Station, says such pastures can be saved to some extent by proper care. Where the acreage of pasture is sufficient and with a little to spare, many of the bare or thinner spots can be top-dressed with good barnyard manure to advantage. The top-dressing will protect the roots somewhat, and in the course of a month or two a decided improvement in quantity and quality of grass will be noted.

"It is good practice," says Mr. Boss, "to divide the pasture into two fields, if possible, and pasture alternate weeks, or for alternate longer periods, depending on the quantity of grass and the condition it is in. A part of the pasture should be allowed to make good growth and be held in reserve until the hot weather of July and August comes on. During the fly season it is difficult enough to keep stock in good condition even when they are on good pasture, and no pains should be spared to have at least one or two extra pasture fields for this season."

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

The wond'rous perfumed smell of ...,
The purpling color, too.
The stories poets tell of it,
The things the blossoms do.
The meadows and the way of it
Now here, now there, a sort
Of gypsy, and the play of it,
In Nature's gladsome sport.

The herd is mighty proud of it,
It means th' golden cream.
And see the flowered crowd of it,
Where orchard beauties dream.
Each clover bloom—each bud of it,
Brings fortune to the herd.
The very boon and blood of it,
Makes it a happy world.

From Los Angeles comes a hen and egg story that must be repeated here, because once upon a time the fisherman was popularly supposed to be the biggest and most picturesque liar. The hen that made fame for herself is a White Rock. She is owned by one Jacob Winkler, No. 2656 Lacey Street, in case you want to verify the facts. For a long period, this hen went about her laying in the regular way. But suddenly Madam Hen layed an egg that was the size of a peanut and was reportedly like one. All of which local chronicled in proper order to the White Rock chamber of commerce. When a Rock lays peanuts, it's high time somebody did some investigating.

Speaking of Hens

And while on the subject of eggs and things, it is just as well to follow the idea evolved by the State Agricultural College at Storrs, Conn. "In the thirty-first week of the ninth annual egg-laying contest at the college, the egg yield leads the crack poultry fanciers to reach a definite decision about Madam Hen. It is officially given out that many hens in the state are getting by, yearly, with a measly production of perhaps eight or nine dozen eggs, and now their owners are advised that said birds must get busy immediately and show at least two or three eggs more a month, to eliminate the slackers. The minimum production allowed must be eleven or twelve dozen annually."

And here is the reason for the highly scientific deduction: High egg prices appear inevitable, due to the high cost of feed and labor. Therefore the poultryman must get more money for his eggs, or he must sharply reduce the cost of feeding his flock through getting more eggs per hen. Making birds comfortable by keeping coops free from red mites, seeing to it that the hens have an abundance of fresh drinking water, segregating the cocks after the hatching season, providing plenty of green feed in winter as well as summer, all will help in coaxing the hens to better production. Plymouth Rocks have led in the contests for many seasons but this last test shows that Leghorns rule the roost.

Just to walk out in a field and see the grass and clover growing may not mean much to an ordinary individual. But cows coin all that into the currency that buys health.

The pasture to a herd means the dinner table of mankind. There the banquet is spread for cows, and what on earth would our meals mean if there was no such thing as milk and cream and butter?

There's Just ... Efficient
CREAM ...ARATOR
And ...at's The
DE LAVAL
For Forty Years
The World's Standard

There may be a half-dozen plows, wagons, tractors, autos or other farm equipment to choose between, but no would-be imitator or utilizer of expired De Laval patents has yet produced a cream separator comparable with the De Laval.

First in the beginning, De Laval machines have led in every step of cream separator improvement and development. Every year has presented some new feature or betterment, and the 1920 machines are still better than they have ever been before.

If you haven't seen or tried a new 1920 De Laval machine, any local agent will be glad to afford you the opportunity to do so.

If you don't know the nearest De Laval local agent simply address the nearest main office as below.

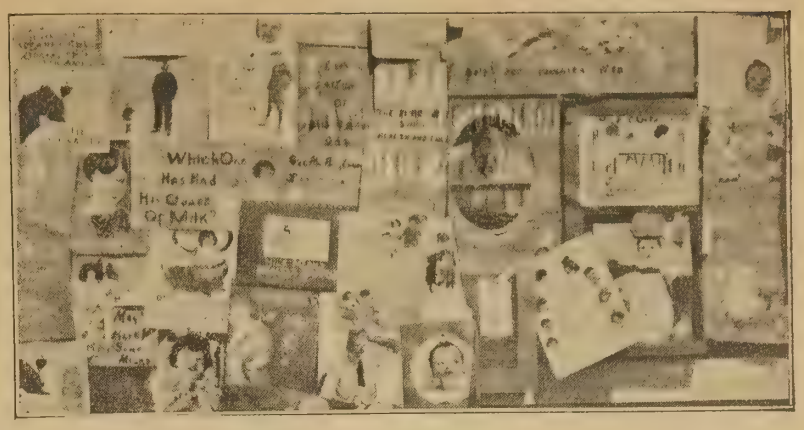
Milk Makes Kids Husky

EDITH KNIGHT HILL, Secretary Oregon Dairy Council

MEDFORD is a substantial attractive town in Southern Oregon. The Siskiyou mountains, snow crowned, look down on the town, the sun shines on it, and for miles around are orchards and dairies, farms, and lovely scenes. Farther up on the hills are grazing lands. But in the center of all this loveliness the dairy council in its survey found that 30 per cent of the children get no milk in their diet.

This fact alarmed the home demonstration agent, Miss Florence Pool, and at the suggestion of Mrs. Jessie McComb she prepared a program for a milk campaign. Grant's Pass, just a few miles away, had the campaign first with Miss Ruth Corbett in charge. Medford followed immediately, using the same picture slides, posters, and general play.



The secretary of the Oregon Dairy Council went to Medford and spoke to the school children, divided into three groups, third and fourth, fifth and sixth, seventh and eighth grades being grouped. From the talks and the leaflets the children were given information and inspiration for the posters they were to make and the essays they were to write. Then they went to work and on the morning of the last day of the campaign a committee of judges selected the best two essays and best two posters from each group and named a grand prize winner. The Medford Chamber of Commerce gave a cash prize to each child on the list of winners. Then at noon the Commercial Club gave a dairy luncheon in the Hotel Medford and lady Miss Pool and the parent-teacher ass put on the prettiest fairy pageant imaginable. Little girls and several little boys, too, all dressed in white were milk fairies. And they were the prettiest youngsters, the milk-fed type.

Each child had a card fastened with a loop of cord bearing a letter. A make-believe milk bottle was placed before the basement window of the city library and at a given signal out popped the first fairy who announced the pageant. Then one by one out trooped the little fairies spelling milk facts as they arrived. There were "Rosy Cheeks" and "Pearly Teeth" and "Alert Minds" and a lot of other folks and as they appeared they danced on the lawn and sang and, by clever management, changed position to spell other milk facts. The final statement spelled by the little boys made quite a hit. It was "Milk Makes Kids Husky".

In addition to the children's part and the co-operation of the teachers, which was splendid, the stores put in special exhibits. A hardware store showed milk pails and dairy utensils and an exhibit of hay, silage, and other feed that goes to make a gallon of milk. This was prepared by the farm agent. Other places showed comparative food values and one showed a milk bottle attached to a balloon basket, holding down the high cost of living. The balloon was in reality a basket-ball with a string crocheted covering. But it was most effective. The whole town co-operated and when the campaign was over not a person in Medford had been overlooked. Everyone knew about milk and its food value and the milk men did a good-office business but best of all the children were getting nourishment that one-third of them had lacked before.

To carry on its extension work and enlarge its scope the Oregon Dairy Council is planning to adopt a new policy for raising money and use the plan similar to the National Dairy Council's but modified to suit local conditions. A letter was therefore sent to each member recently asking if the members were willing for the change and asking if they wished their subscriptions used if the new way were adopted. The replies are all encouraging, expressing the greatest confidence in the council and appreciation of its work in educating the public in regard to the vital food value of dairy products.

Milk stations established by the council with the best of co-operation from the teachers and principals are doing well and paying their own way. At Failing school in a foreign district, Miss Porter, the principal, reports the station self-supporting and most popular among the kiddies.

THE G. L. F. EXCHANGE IN NEW YORK

ROBERT L. VOORHEES, NEW YORK

THE week of June 21st has come and gone. But it is a week that will always remain memorable in the minds and hearts of progressive dairymen and other farmers in conservative New York State. For during that week they were given an opportunity to become shareholders in the greatest farmers' co-operative movement that has ever been conceived, barring none. They were offered stock at $5 a share in the organization for which articles of incorporation were filed early in June, known as the Grange League Federation Exchange, Inc., authorized to capitalize for $1,000,000 with a stock issue of 200,000 shares.

The name of the new venture will tell most of the story. Its purpose, as outlined by its leaders, will complete it. And there is no doubt but that story holds more hope for farmers who are really versed in agricultural conditions than the story of any organization that has been established before. As its name implies, it has been formed jointly by the members of the Grange in the state, the members of the Dairymen's League, and the members of the county farm bureaus. It is a great thing when each big organization in the state gets together and works to one end, and that end the practical improvement of agricultural conditions in a way that will antagonize no interests except those that have wrongfully been fattening off the farming business.

As a means of protection, many co-operative farming associations have been started in the last few years. In almost every county in every state there is some kind of an organization to help the farmer-members in their efforts to get an equitable price for their products. Logic naturally suggests that it is a natural development for all of this co-operative work to be amalgamated in a big central state organization. Also, in order to offset the advantage which those who control binder twine and other things which the farmer must have, it would be a logical evolution to have a big and powerful buying organization which would be able to overcome the leaches.

It is the final purpose of the G. L. F. Exchange, as this new venture in New York State is popularly called, to effect this saving. Anyone at all acquainted with modern business must hesitate to claim that it will be able to accomplish all of these things at once. It won't. But the fact is that it is good machinery for the purpose founded upon a correct principle. There is no doubt that if it is carried on correctly and a methodical, if slow and sure, program is consistently followed it will finally achieve its purpose. And who could expect a baby to spring full armed to the fray—for fray it will be.

But it is wrong to call it a baby. In fact, it is really almost two years old, for it will take over the business of the same order which was established by the New York State Grange about 22 months ago. This business, with an initial and total capitalization of only about $30,000, was able, in that time, to work up to a business amounting to $100,000 monthly, to pay off all indebtedness, to create a comfortable reserve, and to pay six per cent on its outstanding stock. In that time it has learned many things and the new exchange will have the benefit of these.

New York is a big dairy state, in fact, one of the biggest. It is not saying too much to state that New York dairymen will use the exchange more than any other class of farmers. They buy 450,000 tons of feed yearly, cost-

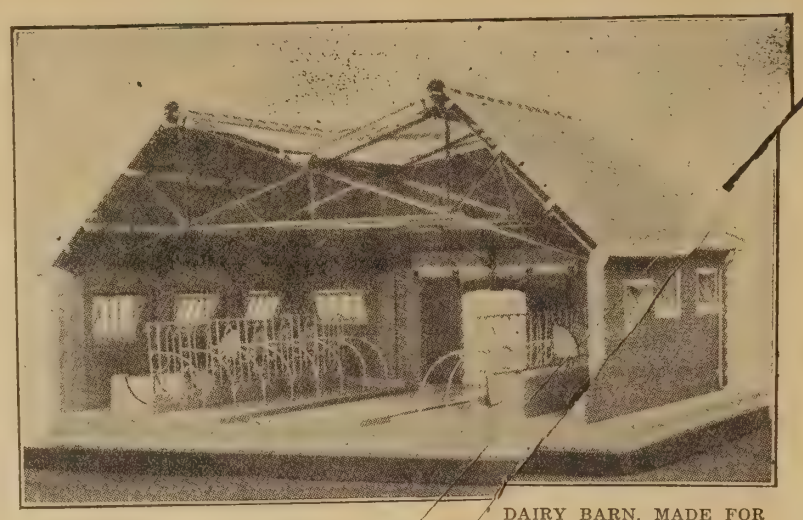
An Americanized Dairy in Old England

BRADFORD A. COOKE, IOWA

AS you pass down the drowsy street of some English provincial town—or even a residential street of London itself—in the sunshine of a summer morning, you'll probably see drawn up against the curb, a milk cart hauled by a plodding old nag in charge of a slovenly, unkempt boy. On the cart bold letters declare "clean, pure milk", and the name of the person or persons dispensing it.

The ten- or twelve-gallon can containing the milk has sloping sides and often is dirty, battered, and rusty, showing signs of wear and hard usage. The brass faucet at the bottom of the can (or "churn" as it is called) is polished to the extreme, for your Englishman must have clean brass. The effect is, of course, lost for it shows off not its own brightness, but the ugliness of the can. And beside the can are smaller utensils, all getting dirt from the dusty street, while hungry flies buzz thickly about. Seeing this you wonder how even the gullible public can believe such a brazen declaration, "Clean, pure milk".



Now the cart is some day doomed to disappear, and I think soon, for modern methods of delivery are coming in to supersede the old, and bottles to take the place of the churn and jug.

No transformation comes without some actuating force and the gradual change that has come about in English milk production, leading up to the milk laws that went into effect on March 14th last, is largely due to the efforts and energy of a man who received his training in the United States. This man is Wilfred Buckley of Basingstoke, Hampshire, and his one aim has been to produce pure milk, coupled with the attempt to improve milk standards of the country and place the production of clean milk on a practical basis.

In days gone by, and even up to t present, milk production has much to be desired. Previous to when tentative milk laws wer was but never put into effect, were milk and no classes or named defined. True, the milk milk", or his milk "special", these names "children's milk", rade and the were only tricks ng, meant nothnames, strictly steurized", "cering. The ter such as we know tified", and were unkno especially small ten-

Many fa have labored in difants, in barns old fashioned and ficulty with much too little incon the cattle they were respa house, causing crowding and g through lack of fresh air. ely window or two admitted just cient light to emphasize the thickess of the dust in its path. Cobwebs bearing mute testimony to the age of the barn hung as graceful decorations from the ceiling. They were built to stand, those old barns, and when we are gone they will still be there. But a new rule will guide the hand that does the chores, a rule of cleanliness, and the cobwebs will have disappeared. A progressive English farmer will have punched holes in the walls to make windows for more air and light, and the old quagmire in the barnyard will have disappeared. At least so thinks Mr. Buckley, who, while living in America, observed the workings of New York State pure milk laws and had a vision of entire reconstruction in the English dairy industry.

It was my privilege, while in Eng- nd after the armistice, to be sta- ed at Basingstoke at a Canadian al, where I was told of Mr. and his work at Moundsmere eing interested in agricul-

ture and especially in dairying, I re solved to see for myself the farme the man who is said to produc cleanest milk in England. ot an

I found Moundsmere to b ansion ordinary farm house, but of a plu that might well be the ho e home of tocrat. Then as I enter ring at me this Englishman I s ous place in from the most co eorge Washingthe hall a picture his but said nothton. I wonder must have followed ing, but my astened to explain. my gaze fo said, "my wife is an

"Yes," d I myself have lived in Americ State for a number of New That is where I got all my yea xperience which I aim to put d practice here. I try to produce n milk, put it on the market in the w state, and have a product above the highest grade of milk sold in London."

And he does. At some time during each week a sample is taken by University College, Reading, to be examined for bacteria, and from 24 samples covering a period of six months during the winter of 1918-19 the average number of bacteria found was 1,130 per cubic centimeter. In only nine cases was the count over a thousand. The consistency of a record like this is an example of what is possible to him who will take care to be clean.

You will notice that these figures are for the winter months. Winter is the hardest time to produce clean milk and to better understand the above achievement let us just look at these figures in comparison. Average London milk at that time contained anything above a million bacteria per cubic centimeter. A sample taken at random from a London dairy showed a count of 22 millions per c.c. "Grade A" pasteurized milk in New York City may contain as many as 30,000 per c. c. New York City standard for "certified" milk is 10,000 per c. c.

Moundsmere Manor equipment is elaborate and expensive and the owner's thoroughness characterizes every operation. The buildings form a sort of quadrangle, with one barn on the east side and implement sheds on the north end. Another cow barn stands on the west side and sheds for young cattle and horses along with the hospital enclose the south end. A gate admits you to the yard on the west side. The cow barns are new and highly modern in construction, having been built in 1915 when the original ones were destroyed by fire.

A noteworthy feature of these two barns is the roof which, instead of sloping downward all the way from the centre to the eaves, comes to a peak at about half way to the center and from there slopes inward, the latter slope being glass, thus admitting a maximum of light in proportion to inside space. This method allows direct sunlight to reach the cattle no matter what the time of day and, of course, maximum results for money expended.

The one outstanding feature of the farm, however, is the separate milking barn, used for no other purpose, the interior of which is of cement and iron throughout. The cement floor is kept spotless and is more accustomed to water and the scrub brush than many an American kitchen. Foul odors and dirt find a "No Admittance" sign on the door. The barn is surrounded by a concrete walk about four feet wide which serves to keep dirt away from the doors.

Passing from here we go twenty yards to the milk house, where the finishing touches are put on. In it are two rooms, one for boiler, sterilizer, and washing sinks, the other for cooling and bottling for market, for all of the milk is bottled on the premises.

When milking time comes around the cows are driven into the milking barn in groups of 25, having been previously washed. The milkers enter, wearing clean, white suits and ca to prevent contamination from t source. To keep bacteria out no portion of the milker's body is allowed to touch the cow unnecessarily. Small top pails are used as further precaution against dirt. Mr. Buckley says that these alone will enable a man to produce clean, sanitary milk. All the milking is done by hand although only a small staff of milkers handle the entire herd of about 70 cows, for Mr. Buckley, progressive as he is, still remains skeptical about the use of milking machines. "I have yet," he claims, "to see any milk, drawn by machinery, that compares favorably with the product of Moundsmere Manor."

On such a farm I naturally expected to find a herd of fancy cattle, but was doomed to disappointment. A grade Shorthorn herd was all I saw. But there are herds and herds. Mr. Buckley's is headed by a bull from one of the most famous families for milk production. Intelligent grading has developed an average production of 700 gallons a year per cow for the entire herd of 70. Of these some half dozen are 1,000-gallon cows. Production, he claims, is his purpose, and not to raise expensive pure-breds. Moreover, he prefers to do one thing well.

Dirt is not the only cause of contamination. Disease, contagious and hereditary, has to be reckoned with and one of the greatest things Mr. Buckley has done is to provide against it in his herd. The hospital houses every sick cow until she recovers and every newly acquired cow until she has been examined for tuberculosis and proven free from it, when she is allowed to join the rest.

Immediately after it is drawn the milk is taken to the milk house to be cooled and bottled for market. The bottles are capped in the ordinary manner with sterilized caps and then sealed with an extra cap and wired, thus gaining a three-fold object, protection from contamination and theft in transport, protection of Moundsmere's reputation, and advertisement of Moundsmere's goods. So thoroughly is the milk house protected from dirt that the milkers are not even al-

FASTENING PAPER CAPS OVER THE LIPS OF THE BOTTLES TO PREVENT SUBSEQUENT CONTAMINATION

Facts from Ohio's Fertility School

CLARENCE M. BAKER, OHIO

IS there something more to the selling of a product that fertilizer salesmen should know and how can they find out? These are some of the things taken into consideration in the fertilizer school held recently in Ohio, a part of which was conducted at the Ohio State University, Columbus, and the other at the Ohio Experiment Station, Wooster. This school consists of a program of lectures, demonstration and field studies.

What Plant Food Is

Professor M. A. Bachtell explained first to the 150 fertilizer agents that quite a number of the elements are necessary as plant food, the principal ones being carbon, oxygen, nitrogen, phosphorus, potassium, calcium, magnesium, iron, and sulphur. Phosphorus is being found in the bones of animals; potash in the ash of plants. Nitrogen—a large per cent of the air is nitrogen and calcium, which is known as the great regulator of soils, is found in limestone. Calcium is valuable in strengthening the cell walls of the plant, encourages the growth of clover and helps to develop vigorous roots and root hairs.

Sulphur only recently has been regarded as a necessary plant food and present studies and investigations show that many soils may need sulphur. Sulphur is one of the constituents of the oils of plants, which gives flavor to mustard, onions, horse-radish, etc. However, in actual practice, acid phosphate furnishes all the sulphur that is needed for soils in most cases.

There are three elements which have been limited to fertilizer practice, namely: nitrogen, phosphorus, and potassium. Other elements may become of greater importance as soils are farmed over long periods. Liming the soil adds much calcium and magnesium and others are supplied with acid phosphate or sulphate of ammonia. Therefore, fertilizers may be valued generally on the elements considered commercially valuable.

A soil is usually judged by its ability to produce crops, but plant food and soil fertility are not always synonomous. Soil fertility includes factors in the soil that contribute to plant growth when supplemented by favorable external conditions. It is not practical that plants may be analyzed and fertility elements supplied to the soil in the proportion that they may be found in the plant and it is necessary to carry into actual experiment to find out what plants really need. The chemical laboratory helps to discover some things, but authentic information can only come after long years of experiment.

Soil Characteristics and Their Relation to Fertilizer Requirements

Guy W. Conrey and E. E. Barnes pointed out to the fertilizer people that it is necessary to recognize that the soil is fertilized to grow the crop rather than simply to fertilize the crop. consideration of the character of the soil is important from this viewpoint. Texture means the size of particles which make up the soil, while structure refers to the arrangement of the particles within the soil, whether in single grains or in groups or in clusters.

Color is important in that it indicates something of the character of the soil. Brown soils are usually well drained, while a gray color indicates poor drainage; colors may be modified by organic matter in the soil, as a black soil is generally high in organic matter, but generally deficient in drainage.

Organic matter is important in improving the structure of both clay and sandy soils and also for increasing the water-holding capacity.

In practical tests, the plowing down of clover sod has a tendency to increase organic matter; crop rotation and the application of mineral fertilizers also aid.

Acidity is a soil characteristic quite important in crop production. Clover failures are frequently traced to acidity. There is an injurious effect to crops on acid soils not always due to acidity but to other compounds often found in soils where liming has not been practiced. Liming then corrects acidity and also destroys some of these injurious compounds.

The effect of drainage on soils is most forcibly brought out at the Clermont County farm in Ohio, where fertilizers have been tried on drained and undrained land. In a rotation of corn, soy beans, wheat, and clover, there is a total increase of $58.20 on the plots receiving phosphated manure and limestone on drained land as compared with $35.21 increase on undrained land, per acre. A definite increase is found on practically all drained plots over the undrained in this soil fertility work.

In consideration of soils, sandy soils are benefited by increasing organic matter and the water holding capacity through the growth of legumes. Lime is important to grow legumes, which in turn produce nitrogen for such a soil.

Peat and muck represent soils having a large amount of organic matter and of course are low in mineral elements, particularly potassium and phosphorus, so that the use of large amounts of fertilizers on these soils containing these elements are effective.

In general consideration of soil characteristics, it has been found that phosphorus is usually the limiting factor in crop production and that liming is essential where the soil is acid; that soils of heavy texture are fairly well supplied with potassium, and all special crops like potatoes, tobacco, and sugar beets need an additional supply of this element.

Work at the Ohio Experiment Station

After several days of program at the Ohio State University, the fertilizer men were taken to the Ohio Experiment Station where they were given a chance to view the fertilizer work.

Director Thorne outlined the work at the Ohio Experiment Station, stating it was possible from the work done at the Ohio Experiment Station to produce bread from the soil to produce crops without depending upon the earth; that it was possible to grow crops without depending upon original plant food in the soil, but simply using the soil as a place upon which the crop may rest and take root. This is borne out by the fact that the average yield for heavily fertilized corn in continuous culture has been 45 bushels per acre, or an increase of 33 bushels as compared to the non-fertilized continuous culture. Figures for oats are 47 bushels—an increase of 25 bushels over continuous culture, non-fertilized. In wheat there is a yield of about 23 bushels—an increase of 15 bushels over the unfertilized plots. The continuous culture, of course, is not practical in farm application, but these experiments support the fact that crops may be grown entirely from the plant food applied through commercial fertilizers although at considerably more expense than one could grow them in a rotation where clover and fertilizers are also added.

The effectiveness of phosphated manure in comparison with complete fertilizers in producing crops was a surprise to a good many of the fertilizer agents. For instance, in a 3-year rotation of corn, wheat, and clover, where 8 tons of stall manure and 300 lbs. of acid phosphate is placed on corn, the average yield from 1897 to 1905 was 63 bushels per acre of corn, 23 bushels of wheat, and 4,212 lbs. of clover. For the second period of this long-time experiment, from 1906 to 1918, the average is 70 bushels of corn, 31 bushels of wheat, and 5,336 lbs. of clover. Now, where no manure was added, but a fertilizer made up of 80 lbs. acid phosphate, 80 lbs. muriate of potash, and 160 lbs. nitrate of soda was added, the average yields for the first 12 years were 45 bushels of corn, 12 bushels of wheat, and 2,700 lbs. of clover. For the second period, the yield of corn was 52 bushels, wheat 23 bushels, and clover 3,552 lbs.—a gradual increase, but not equal to that of phosphated manure. In this test, even yard manure, untreated, but applied regularly in the rotation for the last 12 years of the period, has given 55 bushels of corn, 26 bushels of wheat, and 4,217 lbs. of clover to the acre in the rotation year.

21 crops average unmanured yield for corn is 36 bushels, for 21 crops 18 crops at 14 bushels, and for Another 2,815 lbs.

Getting Every Drop

WHEN you milk a cow you make it a point to get every drop of milk—to milk her as dry as possible. But after you have done this, do you try as diligently to get every drop of cream from the milk?

Skimming the milk clean is just as important as milking the cow dry. To do the latter successfully requires a pair of experienced hands; to accomplish the former to the best advantage requires a

Primrose Cream Separat[or] cream.

The Primrose saves every drop [of] wide open cream screw. It is the only separator with tw[o] *skimmilk outlet.* cream outlets, unobstructed by [gear]s on the large vol- The regulating screw is in t[he] all volume of cream. u Milk 6 Cows or More?

Do

F you do, you have undoubtedly asked yourself these questions:—Is it *true* that a milking machine will greatly reduce my milking time? Is it absolutely safe to use on my cows? Will it pay me to install a milker in *my* dairy?

These questions, and hundreds of others, are answered in a fair-minded way in this new booklet:

"The Truth About Mechanical Milking"

This booklet of bedrock facts is *yours for the asking.* It has been prepared by the Universal Milking Machine Co., but it is *not* a Universal catalog. Only a few pages in the back deal with the Universal directly. It is written to give you *the real truth*--facts you have always wanted to know--about mechanical milking. *A book of vital interest to every dairyman who milks six cows or more.*

Clip this coupon and send it to us today. No obligation. The book will be mailed, free of charge, and postpaid, immediately upon receipt of your letter.

The Universal Milking Machine Co., Columbus, O.

Association Notes

Montgomery County, Ohio:—Market milk in April sold for $3.80 per cwt. The creamery paid 65c per lb. for fat. Milk retailed at 16c per quart, butter at 70c, and cheese at 40c per lb. Oats sold for $66 per ton, cottonseed, $80; bran, $60; mixed feed, $80 to $90; corn, $2.30 per cwt.

Buffalo Valley, Pennsylvania:—Not many unprofitable cows are being weeded out at this time. Members are buying their feed co-operatively. The farmers are beginning to feel the need of better sires. In May market milk sold for $2.55 per cwt., testing 3%. Milk retails for 12c per quart and butter for 70c per lb. Oats is rated at $1.40 per bushel and corn at $2.

Fort Atkinson, Wisconsin:—June condensery milk sold for $2.75 per cwt. Feed prices are: Bran, $57 per ton; corn meal, $62; oil meal, $74; oats, $1.10 per bushel; pasture, $3; silage, $7 per ton.

Meadville, Pennsylvania:—Six unprofitable cows and one scrub sire were sold during May. There is now but one more sire to be replaced by a pure-bred. A bull association is started with the hope of increasing the number of pure-bred sires. Market milk sold for $2.90 per cwt. Unicorn sold for $80 per ton; linseed meal, $82; cottonseed meal, $82; corn meal, $90; wheat bran, $65; Larro, $75; pasture, $1.50 per cow.

Whatcom County, Washington:—May market milk testing 3.8% sold for $2.60 per cwt. The creamery paid 62c per lb. for fat. Milk retails for 12c and butter for 65c. Mill run is valued at $48 per ton; ground corn, $65; oil meal, $78; oats, $60.

Richland County, Wisconsin:—A number of unprofitable cows were disposed of during May. An increase in production is the result of feeding cows a balanced ration while on pasture, which had never been tried in this association before. Farmers are buying their grain co-operatively in carload lots. Several milking machines and a number of drinking cups have been installed. Better barns and a few silos are being built. In May 4% market milk sold for $3 per cwt. The condensery paid 75c per lb. for fat, the creamery paid 60c, and the cheese factory 57c. Milk retails for 12c per quart, butter for 56c per lb., and cheese for 23c per lb. Oil meal is rated at $85 per ton; oats, $60; cottonseed meal, $82; bran, $52; corn, $55; barley, $67; alfalfa hay, $40; Boss Feed, $64; Schumacher, $62.50.

Posey—Gibson, Indiana:—Plans to co-operate in showing cattle at the state fair are being made and the men are fitting their animals now. Members who have been supplementing their pasture with grain are getting good results. Two A. R. records are being made in the association. The creamery paid 60c per lb. for sweet butterfat and 50c to 54c for sour. Milk retails for 16c per quart and butter for 70c per lb. Corn and cob meal is priced at $56 per ton; bran, $60; cottonseed meal, $85.

West Branch Co-operative, Pennsylvania:—This association completed its year's work June 11th, at which time two associations were formed from the one, with the addition of some new members. The high cow for the year was a pure-bred Holstein owned by J. E. Linker. This cow produced 14,154 lbs. milk and 316.5 lbs. fat. The highest butterfat producer was a grade Holstein owned by Luther Schooley, which made 416.9 lbs. fat in 12,053 lbs. milk. The association records for one year show an average milk production per cow of 6,402 lbs., an average fat production per cow of 236.4 lbs., an average income above feed cost per cow of $97.49; returns for $1 invested in feed, $1.70; feed cost of 100 lbs. of milk, $2.16; feed cost of 1 lb. of fat, 58c. There were 358 cows tested for one year, of which 29 did not pay their feed bill for one or more months, 33 produced over 10,000 lbs. milk or 300 lbs. fat, and 4 produced over 400 lbs. of fat.

Ellington, Wisconsin:—One pure-bred bull from a dam with an A. R. record of over 600 lbs. fat has been bought. The condensery paid $2.65 per cwt. for 4% milk in June.

Arkansas Valley, Colorado:—In June there were 43 quality cows, of which one produced over 90 lbs. fat, two over 80 lbs., and nine over 50 lbs. Members are looking forward to an increase in the quantity of milk produced in a few months, as most of the dairymen are breeding for fall production and the cows are generally at their lowest now. Feed prices for the month of July are: Corn chop, $2.65 per cwt.; barley, $2.90; bran, $2.40; shorts, $2.60; maize, $2.05; oats, $3.35; cottonseed, $3.95; beet pulp, $4; silage, $8 per ton; alfalfa hay, 1st, $18; alfalfa hay, 2nd, $15.

Johnstown, Colorado:—Two herds decreased their number of milking cows during June, J. W. Whowell & Son disposing of 12 grade Holstein cows at an average price of $250 and Van Meter and Krebill selling five grade Holstein cows at an average of $235. These grade cows will be replaced with pure-bred heifers. Another member sold a fine bull calf. June market milk testing 4% sold for $2.70 per cwt. The condensery

paid 67½c per lb. for fat and the creamery paid 72c. Milk retails for 15c per quart. Silage is rated at $8 to $10 per ton; hay, $15 to $20; oats, $3.80 per cwt.; barley, $3.35; corn, $3.60; bran, $2.65; milo maize, $2.60; dried pulp, $1.75; oil meal, $4.60; cottonseed meal, $4.25.

Fairfax, Virginia:—Three unprofitable cows were sold during May and four pure-bred cows were bought into the association. The increase in production of the association over last month was 35.8 lbs. milk per cow. Market milk sold for 38c per gallon and 20% cream for $1.50 per gallon. Alfalfa hay is rated at $40 per ton, mixed hay, $25; corn silage, $10; "Ready-mixed" grains, $80; wheat bran, $62; beet pulp, $60.

Contoocook Valley, New Hampshire:—The two Jersey cows heading the list in June were Clever Little Lady and Dream's Miss Jane, producing in the last 120 days 303.1 and 283.8 lbs. butterfat respectively and exceeding the work of Loretta D by 22.9 and 3.6 lbs. butterfat. Feed prices here are as follows: Bran, $65 per ton; gluten feed, $78; cottonseed meal, $80; oil meal, $72; ground oats, $84; corn meal, $78; Union Grains, $82; hay, $30; silage, $8.

Westerville, Ohio:—Of the 307 cows tested in June, 5 produced over 60 lbs. fat, 15 over 50 lbs., and 23 over 45 lbs. The average per cow was 623 lbs. milk, 27.1 lbs. fat, with an average per cent of fat of 4.59. Market milk testing 4% sold for $3.50 per cwt. The condensery paid 62c per lb. for fat, and in addition, 80c per cwt. for milk. Butter retails for 63½c per lb. and milk for 14c per quart. Oil meal is rated at $4.20 per cwt.; cottonseed meal, $4.10; bran, $3.10; middlings, $3.55; corn, $2.85; oats, $3.80; Big Q, $4; gluten, $3.90; Cow Chow, $4.25; Top Notch, $3.65; Union Grain, $4.20; hay, $30 to $35.

Byron, Wisconsin:—All cows are now on pasture. Some herds are getting silage and a little grain with the pasture. Highland pasture is figured at $5 per month per cow.

Wilson County, Tennessee:—During June several unprofitable cows were replaced by better ones. Most of the members are feeding a grain ration to supplement pasture. Feed prices are: Cottonseed meal, $4.10 per cwt.; Schumacher, $3.35; Dairy Feed, $3.25; Cow Chow, $4.40; pasture, $1.50 per cow per month.

Loudoun Valley, Virginia:—The average production of this association for May was 582 lbs. milk, 23.6 lbs. fat. Market milk sold for 36c per gallon, and 20% cream for $1.75 per gallon. Milk retails for 16c per quart and butter for 75c per lb. The following prices are paid for feeds: Alfalfa hay, $40 per ton; clover hay, $35; mixed hay, $35; corn silage, $8; "Ready-mixed" grains, $80; wheat bran, $63; middlings, $80; corn meal, $76; cottonseed meal, $84; oil meal, $65; beet pulp, $60.

Augusta County, Virginia:—This association averaged 612 lbs. milk, 31.06 lbs. fat during May, which is an increase over last month of 38 lbs. milk. Six unprofitable cows were sold during the month and one pure-bred bull and two pure-bred Guernsey cows were bought. Market milk sold for 31c per gallon, or $3.60 per cwt. Twenty per cent cream sold at $1.80 per gallon and butterfat at 70c to 75c per lb. Milk retails for 15c per quart and butter for 70c per lb. Alfalfa hay is rated at $35 per ton; clover hay, $30; mixed hay, $30; corn silage, $10; "Ready-mixed" grains, $80; wheat bran, $54; middlings, $52; cottonseed meal, $80.

Prince William, Virginia:—Two unprofitable cows were sold during May and one pure-bred bull bought for the association. The average production of the association for the month was 809 lbs., milk, 23.04 lbs. fat. Milk sold for $4.18 per cwt. or 36c per gallon and 20% cream for $1.96 per gallon. $1.16 per lb. was paid for butterfat. Milk retails for 14c per quart. Feed prices follow: Alfalfa hay, $40 per ton; clover hay, $40; mixed hay, $32; corn silage, $8; "Ready-mixed" grains, $72; gluten meal, $80; wheat bran, $79; middlings, $82; corn meal, $84; cottonseed meal, $80; oil meal, $92; beet pulp, $67.50.

Wisconsin Dairy Council News

During the month of June, 29 creameries, one cheese factory, one ice cream factory, one market milk plant, one breeders' association, and ten farmers joined the Wisconsin Dairy Council. Thirteen of these creameries were co-operative creameries, which goes to show that the farmers believe that their product should be advertised. The average membership is lower than last month as the average during June was only $17.04 for creameries, $5.11 for cheese factories, and $7.28 for farmers.

Bayfield County has a 100% membership, the first county in the state to reach that limit. Mr. E. R. Tetzner, proprietor of the Spring Hill Live Stock Farm and secretary of the Chequamegan Creamery Co., is responsible for this splendid showing as he accepted the chairmanship for Bayfield County and his good neighbors recognized the value of such an association; therefore, they made it 100% membership. If all the counties would do likewise the Wisconsin Dairy Council would be in a position to advertise dairy products in the way they should be advertised. Nearly every one thinks the idea is a good one but they want the other fellow to do the advertising, but remember you never get any more out of a thing than you put into it. Let us put our money and enthusiasm back of the Wisconsin Dairy Council and show that we are producing the best food product in the world.

What county will be the next to report a 100% membership?

The New Way of Making Butter

With the Victor Jr. the butter is made, worked and salted without removing from machine. Because of the roll construction, it **gets every ounce of the butterfat** and for this reason alone soon pays for itself. It is much more rapid than the old way of making butter.

Solve the Surplus Milk Problem

Every dairyman who has surplus milk should use the Victor Jr. and make the surplus into butter. "Victor-Made" butter is high-quality butter and finds a ready sale. The butter is not exposed to outside air at any stage of the process, but is protected from heat, dust, flies, or foul odors and the natural flavor and aroma is retained. Thousands of these churns are now used on model dairy farms everywhere, with great satisfaction.

The Victor Jr. is simple in operation. Full directions for use included with every machine sold. Can be fitted for operation by hand or power. Shipping weight 410 lbs. Price each, fitted for power drive, $115.00.

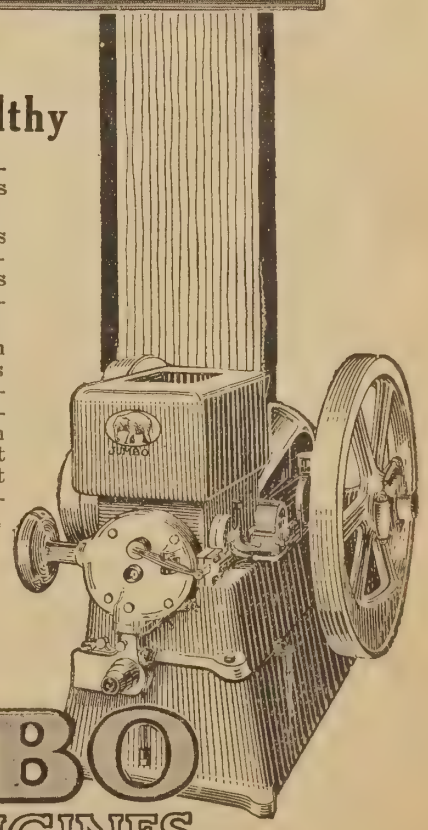
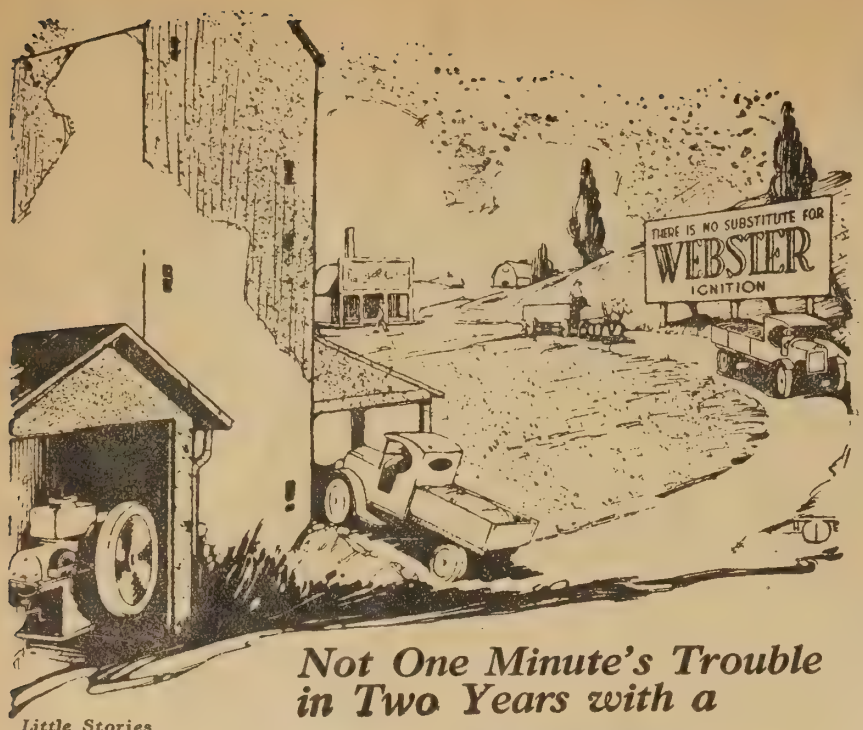
Jumbo Engines Help Keep Hogs Healthy

Shade and plenty of good, fresh water will go far towards keeping hogs healthy this hot weather.



More than 100,000 successful farmers use Jumbo Engines to insure an adequate supply of water in the tank as well as for doing much of the drudgery around the farm.

Webster Oscillating Magneto which gives a big, hot spark every time is standard on Jumbo Engines. A specially designed mixer and an auxiliary valve positively supply a uniform mixture in any weather. A good hot spark in the proper gas mixture must make an explosion. That's why Jumbo Engines always start easily. 1¾ to 12 H. P.



Many other points of Jumbo superiority are described in booklet. Write for it.

Dick's Self-Feed BLIZZARD permits the enormous throat capacity

You couldn't crowd enough wagons and men around the feed table of the machine pictured to keep it supplied if the material had to be man-fed. But Dick's Double Feed Cutter *feeds itself.* Your job is done when you throw the corn on the table.

It's amazing to see how fast the Blizzard will cut the corn and elevate it. The biggest models handle as high as 30 tons an hour. For you there's a model that will fit in with your needs, your power and men available. It will give you every possible satisfaction. Write now.

Curing Alfalfa for Dairy and Beef Cattle

(Continued from first page.)

cretors of moisture but the stems lack the evaporating surface necessary to perform this function. It therefore happens that drying more slowly at first may in the end result in a more rapid curing. It most assuredly results in a much more efficient preservation of the leaves.

The upshot of all this is that alfalfa ought not to be exposed in the swath to direct sunshine any longer than is necessary. As soon as the hay rake will gather the alfalfa it is time to rake. Throughout the arid or semi-arid region—west of the one hundredth meridian—farmers are more and more adopting the practice of curing in the windrow and cock rather than in the swath. This permits the gradual reduction of moisture through the leaves in such a manner that the leaf petioles are kept functioning. In the end the moisture is gotten rid of about as rapidly and the leaves are preserved.

On some large farms the push rake, sweep rake, bull rake, or buck rake as it is variously called is used to transport the hay from the field to the stack or the barn. With this method of harvesting no wagons are used and the hay is handled from the windrow. Soon after cutting, the alfalfa should be raked into good-sized windrows and so left as to dry gradually but thoroughly.

By far the larger part of the alfalfa hay both of the West and the Middlewest is cured in cocks, loaded on wagons, and hauled to the yards. Here curing may be divided between the windrow and the cock with just a little in the swath and just a little left to take place in the mow or stack.

Cock Curing in Favor

In the dry interior mountain region there is a growing tendency to rake the hay immediately after mowing and to cock at once, usually by hand. From Lewiston in Idaho, Umatilla in Oregon, or from the Yakima in Washington all the way through Wyoming, Utah, and Colorado to Arizona, New Mexico, and California the best growers advocate getting the hay into the cock as soon as possible after cutting. On well drained land it is not at all uncommon to see two mowers at work in a field, followed only a few swaths behind with a two-horse rake. Meanwhile a squad of men are making cocks as rapidly as possible so that practically all the alfalfa cut on a given day is in the cock that night. Ultra-conservative farmers at first objected to cock curing on the ground of poor hay and extra labor. The first was almost at once abandoned because this method makes the best possible hay. The objection to extra labor in handling green alfalfa in the field has some weight but not enough to counterbalance the saving that comes from clean and rapid handling in loading and unloading.

Good cocking is also economical because of the fact that the hay settles flat and is not rolled or tangled. One pitchforkful of hay should be lifted free from the remaining windrow and placed directly on top of the swath on which the hay cock is being built. It is rapidly becoming a practice to make cocks just large enough to be handled in one good forkful at loading time. The pitcher does not then have to tear the hay apart in loading. In unloading, the derrick fork also does cleaner and more rapid work. On the stack or in the barn, the man has flat, compact flakes of hay to handle. These settle readily into place when he tramps them. It is also possible to build better stacks when stacking out of doors is the practice as it still is in considerable parts of the great alfalfa region.

Curing in the cock in a region dry enough to permit it has several distinct advantages. First and foremost, the leaves may be practically all saved. This, as already explained, makes the hay both more nutritious and also more palatable especially for cattle and hogs, the two most important animal machines on most dairy and general live stock farms in western and central America. Cock curing also permits easier handling of the hay and consequently less pulling apart. The more compact flakes settle more rapidly and hasten mow or stack curing which, taken in connection with cock curing, develops the aroma of the alfalfa hay.

Aroma and Color Important

As any plant matures it develops a characteristic taste and odor, or aroma. In general green fruits are bitter, sour, acrid, or otherwise unpalatable. This is equally true of alfalfa. If cut for hay before the buds are formed the hay is lacking both in substance and in palatability. When flowering begins, certain chemical juices known as enzymes are given off by cells on the interior of the plant. These render soluble much stored food that has hitherto been insoluble. These begin to move from

SOPHIE'S TORMENTOR'S ELINDA, A JERSEY COW OWNED BY HOOD FARM, MASSACHUSETTS

She has recently completed a record of 14,693 pounds milk, 807 pounds fat at age of three years and seven months. At two years, five months she began a test during which she produced 7,095 lbs. milk, 407 lbs. fat. She is a granddaughter of Sophie 19th of Hood Farm, being sired by Sophie 19th's Tormentor, sold in 1918 to Falfurrias Farm, Texas, for $7,500. The dam of Sophie's Tormentor's Elinda is Lass 47th of Hood Farm with four Register of Merit records, one being of 15,292.4 lbs. milk, 869.5 lbs. fat.

stem and root toward the flower where seed would soon develop.

Cutting in the bloom period catches this plant food in its most soluble form and also when the plant is beginning to develop the sweet smelling aroma of well cured hay.

At mowing time, the aromas have just begun to develop. If the hay be dried out rapidly or exposed to direct sunshine in the swath, the enzymes are killed and cease to function. Only a small part of the aroma is allowed to develop. On the other hand, if the curing is done in the windrow, cock, and mow rather than in the swath, the plants continue to live and the enzymes to work. Out of mercy animals ought to be killed quickly. Since plants have no feeling, it is wise and profitable to cure in such a way as to encourage a lingering death. In fact, the longer life lingers in alfalfa the better the hay will be. Alfalfa cut early and cocked green will continue to pass through enzymatic changes for some time after being stacked.

Not only are the aromas allowed to develop by cock curing, but color is also preserved. Alfalfa can be made to come out of the stack as bright in color as when standing in the field. There is no dust, no mold, no bleaching save a little on the outside of the hay cocks. Such hay is highly palatable. Moreover, it is sweet and considerably more nutritious than hay that is either bleached or dark colored.

The bleaching takes place when direct sunshine or rain comes in contact with alfalfa. Here is where swath curing is detrimental, aside from the leaves lost. Direct sunshine and oxygen from the air decompose soluble protein and permit the escape of a part of it into the air. Rain leaches away soluble protein and ash, particularly after bleaching has loosened it. In the swath every leaf or stem is wet in a shower and then exposed to still more active bleaching while it redries.

Hay in the cock is not exposed except on the outside to sunshine or to rain unless wet by a heavy shower. Dew, which falls in appreciable quantities in the less arid regions, cannot affect more than the outside of the cock. In the swath all is exposed to this alternate wetting and drying. Even when wet through, small cocks will dry out rather readily. In case of prolonged wetting, enough to render necessary the moving of the hay cock, it is probably wiser to allow the top to dry and then merely to lift the cock to one side and set it on dry ground. Tearing it to pieces loses too many leaves and exposes the hay to a possible second shower in a condition that makes heavy loss inevitable.

If canvas covers become generally used in damper regions, curing will be simplified from the standpoint of protection against rain. Expense of investment and of labor in covering and removing covers will always, however, be a considerable handicap in respect to the use of canvas covers.

Jefferson County, Indiana, Organizes Jersey Bull Association

Jefferson County, Indiana, through County Agent B. H. Doddridge and with the help of the Dairy Extension Division of Purdue University, has organized a four-block Jersey bull association. A total of twenty-three members owning 200 cows have joined this association. Very few of these cows are pure-breds and the idea is to improve the standard and type of the native cattle through the use of high class Jersey sires. It was the desire of the association to obtain four bulls of similar breeding with similar fat requirements of 500 pounds average production on the dam and both grandams. Interest at the meeting held in Antioch School House, Jefferson County, June 18 was fine and the desire to bring about better stock conditions was the motive for the organization.

Through this small start of bringing in four excellently bred pure-bred sires it is hoped that the future Jersey stock of this county will gradually tend toward higher milk production and better type. Southern Indiana is coming into its own and Jefferson County is one of the links helping out in the Jersey progress that is being carried out in this section of the state. With a Jersey bull association organized in Scott County in 1918 and two Jersey bull associations in Dearborn County, it is quite evident that the dairy farmers of Southeastern Indiana are beginning to realize the value of better sires. The day of better sires—better stock is fast approaching in this section.

Indiana. A. C. BALTZER.

To repair cracks that may appear in a concrete wall the following method has been suggested by one of our correspondents: Cut out the cracks and brush them until thoroughly dry. Dust cement into hot pine tar until the mixture becomes so stiff that it is difficult to work. Fill the cracks with this mixture while hot, and repeat as often as it becomes cold during the operation.

Alone, this girl milks 28 cows twice a day

The simplicity of the Burrell Milker makes it easy to operate, and easy to clean.

Sanitary milk, cows milked clean (no stripping necessary with the Burrell Milker), milking-time cut in half, larger yields, and a big saving in labor and money—are vital points for you to consider.

This is Miss Boardman. She milks 28 cows with Burrell Milkers while her father runs the ensilage cutter and does other important man's work around his dairy.

Exclusive Features of the Burrell Milker

The moisture-trap, the automatic controller, and the universal teat cup are found only in Burrell B-L-K Milkers. These three important features absolutely insure

(1) Pure, uncontaminated milk.
(2) The scientifically correct amount of force for the hard milker—less force for the easy milker.
(3) An air cushion is formed around the teats and therefore makes one size cup fit any size teat.

Scores of testimonial letters will be sent you if you so desire.

Be sure to get our Free Book. You will find it most interesting and possibly very profitable reading.

D. H. BURRELL & CO., Inc., Little Falls, N. Y.

Manufacturers of Dairy, Creamery, Cheese Factory, and Milk Plant Apparatus

Vanite

The Ideal Cleanser and Water Softener

Makes work easy and saves soap. It precipitates alkali—leaving a soft, sudsy liquid that is a pleasure to use.

For all housekeeping purposes—for the dairy utensils, milk cans, churns, cream separators, crocks, etc., — for laundry work—for food vessels and kitchenware—for use in the bath and on the bathroom fixtures—for windows and mirrors—in fact, for everything cleanable with water, VANITE is the ideal preparation.

It is extremely economical since it can be used in most instances without the addition of soap.

Creamerymen, Dairymen, Buttermakers and Bakers are enthusiastic about the good qualities of VANITE.

In packages or 5-lb. sacks. Ask your Creamery or dealer.

Try it today and you will use it always.

Correction

The caption with the illustration on page 1,430 of the July 2 issue of Hoard's Dairyman is incorrect. The calf shown in an aeroplane is not the one awarded as a prize at the meeting of breeders at Arden Farms as stated. It is the first bull calf delivered by aeroplane, being purchased from Clover Lea Farms, Minnesota, and delivered to Mrs. J. H. Molty, Wisconsin.

Waukesha County Guernsey Breeders in Annual Meeting

The annual summer meeting of the Waukesha County, Wisconsin, Guernsey Breeders' Association took place the first day of July at the farm home of F. E. Fox. In spite of threatening showers, three hundred members and friends gathered to proffer respects to the Guernsey.

At the business meeting reports were made by Secretary Fox, which included a report of business transacted through the office of the secretary of the association. Total sales since the first of March, 1920, aggregate approximately $80,000, which included the annual consignment sale. In this four month period, 354 Guernseys, including pure-breds and grades, were shipped to various parts of the United States, including all sections from New Jersey to Louisiana, and from Missouri to Colorado and Kansas.

A. J. Glover, Editor of Hoard's Dairyman, discussed the "Farm Bureau and Its Value". Many farm organizations have failed because farmers themselves failed to support them. Mr. Glover stated that the farm bureau is one that the farmers can support, as they receive its benefits. Bankers, merchants, railways, and industrial concerns are organized while the farmer has been the last to organize to improve his condition.

The farm bureau was not organized to establish a monopoly or exercise any influence in politics. One of its finest characteristics is the fact that no member can accept a political office and hold office in the farm bureau. No person can become a member unless he is a land owner, renter, or tenant on a farm. Of the $10 annual dues, $.50 are directed to the national field, $2 for the state organization, and the balance, $7.50, remains in the county where it is used to benefit those paying the amount.

A farm bureau can be of great assistance to its members by purchasing materials, such as fertilizers for the land in the form of phosphorus, potash, and limestone. Through cooperation better markets can be obtained for produce. An instance of this was related by Mr. Glover regarding the pea canning industry of Wisconsin. Immediately following the canning season, many producers are forced to sell their peas at a very low price due to accumulating wages and other bills that must be paid, the market is overflowed, prices consequently decline, and the farmer loses. If the farmer would cooperate, the produce could be put in warehouses and kept there until the market is in a normal condition, and prices would be received that would insure a profit.

Mr. Glover advocated the use of farm products on the farm. Many people residing in rural districts patronize the town store buying oleomargarine and nut butter of various descriptions, and sell all the milk and cream instead of keeping part for home consumption. He heavily scored such parties who do not know the great food value of the product they have.

Professor Geo. C. Humphrey of the University of Wisconsin discussed the various phases of breeding cattle that would ultimately establish a higher and better class of pure-breds. Those who see and appreciate the extraordinary opportunities and who do the extraordinary things as Waukesha County has been doing have the satisfaction of seeing their efforts crowned with a high degree of success and of gaining rewards that are truly worth while.

From Professor Humphrey's remarks the following is quoted:

"It has been said that this is the golden age for production and selling pure-bred cattle. Opportunities for selling have been so good that men in many instances have profited more by dealing than they have by breeding. Prices for practically all registered stock, regardless of how it may be bred, have been at a considerable advance over the prices paid for native and grade cattle. This age of easy selling has exerted an influence on the future prospects for pure-breds that should be recognized and that urges us to do the extraordinary things to insure a continued success. Only to the extent that we can succeed in keeping pure-bred cattle in an exclusive class where there will be special demand for them, can we hope to realize prices for them that will make it profitable to produce them.

"One who travels extensively over a given country and has occasion to visit numerous herds of cattle will be impressed with the comparatively low standard of excellence that exists outside of show herds, that have been assembled by purchases to a very large extent, and a comparatively few herds that have been the results of extraordinary work.

"It must be admitted that many, if not the majority, herds of pure-bred cattle show a marked lack of uniformity in excellence. Except for the matter of color, there is not the uniform breed character and excellence of individuality that many people are led to believe exists in our pure-bred registered cattle, especially where their knowledge of breed characteristics is based upon reading breed literature, visiting cattle shows, and attending high class sales.

"How long commonplace pure-bred cattle will continue to command a premium in price over grade cattle is a question and a matter of interest in the present state of pure-bred cattle industry. Developments that are taking place repeatedly with reference to numerous consignment sales of pure-bred cattle, an increased number of pure-bred cattle that are proving their actual value in competition with many grade cattle tested in cow testing associations, point to the necessity of keeping pure-bred cattle in a class where they may be appreciated and regarded as the best and most valuable animals that can be secured for foundation herds.

"Personally, I am impressed with the following facts:

"That many animals never ought to be registered as pure-bred, at least not passed on into the hands of men who reproduce and register from their desirable offspring.

"That many men who purchase ordinary commonplace pure-breds would accomplish more in dairying if they were to continue with good grades or even common native stock.

"That only the get of what might be called certified sires and possibly the produce of a similar class of dams, should be registered.

"The campaign for pure-bred sires on every farm, which in reality goes with the organization of community breeders' associations, has been one of Wisconsin's greatest forward movements in dairy cattle breeding. It has turned the attention of men to the importance of sires in a most forceful manner and promises to become a long time campaign as the results are greater and more gratifying as time advances."

Wisconsin. F. E. Fox.

Farmers' Week at Marshfield

Farmers' Week at the Wisconsin Branch Experiment Station at Marshfield comes on July 27 to 29. The first day is being devoted to farmers from Taylor and Clark Counties, the second day to Wood County, and the third day to Marathon County.

The program covers a wide range of subjects interesting not only the farmers but their wives and the young folks. Mrs. Nellie Kedzie Jones expects to be in attendance the three days, taking up topics of interest in the home. Mr. A. J. Glover will discuss the value of milk from a nutritional standpoint.

The afternoon program will be divided into sections to inspect the soil and crop production work now under way at the experimental station. Hog feeding trials will be another feature of interest in which experimentation was started in 1919. Discussions of practically everything in the chicken department will be held that will be of interest to the farmers and their wives.

The Marshfield Branch Station started eight years ago and during that time has grown to a position that demands the attention of the progressive farmers of Central Wisconsin operating on soil similar to that found in the Station Farm. According to the survey of the Soil Department, upward of 5,000 acres of soil known as Colby Silt Loam is found in Central Wisconsin. It is this type on which the Marshfield Station is located. This soil area is recognized to be one of the finest agricultural regions found anywhere in the United States. The problems arising in soils and crop adaptations will be solved in a large measure at the Marshfield Station.—F. L. MUSBACH.

Correction

In an editorial in the July 2 issue of Hoard's Dairyman favorable comment was made on the splendid work of the Dairy Division in the making of Swiss cheese. Mr. L. A. Rogers, who had charge of the scientific investigations and experimentation, was given much credit for the results secured. Mr. Rogers writes that the actual solution of the Swiss cheese problem was accomplished by his associates. He states that particular credit is due Dr. J. M. Sherman, "whose isolation of the organisms giving Swiss cheese its flavor and eyes deserves special recognition".

ROSE OF LITTLE PLATT

Rose of Little Platt, a five-year-old Guernsey owned by Charles A. Wilkins, Wisconsin, has recently completed a record of 12,159.7 pounds milk, 666.71 pounds fat in Class BB. This record entitles her to second place in her class. She was dropped September 10, 1914, and was bred by J. M. McLeod & Sons, Wisconsin, She was purchased by Mr. Wilkins after dropping a calf on March 24, 1919. Her sire is Frau's Stranford, a son of Glenwood Stranford—AMERICAN GUERNSEY CATTLE CLUB.

Sale Announcements

Aug. 12—Guernseys. Southeastern Guernsey Breeders' Sale, Salisbury, N. C. C. T. Rice, Sale Mgr., Oakton, Va.

Sept. 6—Holsteins. Dispersal of F. C. Brinton, Jr., Herd of Registered Holsteins at West Chester, Pa.

Sept. 13—Holsteins. Dispersal Dr. R. Ivey and Dr. S. P. Scherer herds, Fishers, Indiana.

Sept. 29-30—Hornless Holstein Farms. Geo. E. Stevenson & Sons Sale at Clark's Summit, Pa.

Oct. 12-13—Holsteins. Hornless Holstein Farms. Geo. E. Stevenson & Sons Sale at Clark's Summit, Pa.

Oct. 13—Guernseys. Wisconsin State Guernsey Sale at the Live Stock Pavilion, University Grounds, Madison, Wis.

Oct. 13-14—Holsteins. National Dairymen's Sale in connection with the National Dairy Show, Chicago, Ill. E. M. Hastings Co., Mgrs.

Oct. 14—Holsteins. West Michigan Holstein Breeders' Semi-annual Sale. W. R. Harper, Middleville, Mich., Sec.

Oct. 22—Holsteins. Ashtabula Co., Ohio, will hold sale at County Fair Grounds, Jefferson, O.

Oct. 28—Holsteins. Virginia Holstein-Friesian Club Sale at Richmond, Va. R. V. Martindale, Sec'y.

Oct. 28-29—Holsteins. Green County Holstein-Friesian Breeders' Club Sale at Monroe, Wis. L. L. Hare, Monroe, Wis., Sec'y.

Nov. 16-17—Holsteins. Second Iowa Breeders' Guaranty Sale at Waterloo, Ia. C. H. Jenness, Sec.

Nov. 23-24—Holsteins. Watertown Holstein Sales Co., Semi-annual Consignment Sale at Watertown, Wis. Francis Darcey, Manager.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, JULY 12—There is a notable relief from the tension which had been increasing up to July 1 in both business and political circles. In political activities there is a breathing spell between the conventions and the commencement of the active work of the campaigns. In business circles there is a relief because the fickle weather factor has shifted in favor of increased production and both government and the best authenticated private reports indicate that crop shortages will not be as acute as preliminary estimates seemed to indicate.

Great stress is being laid in eastern circles, reflected here in numerous ways, on the fact that President J. R. Howard of the American Farm Bureau Federation confirms the government crop report showing better conditions in the wheat fields, fair to good corn crop, and increased oat acreage and prospects.

How acute the situation has been, however, is shown by the action of the Interstate Commerce Commission. Nearly every American industry which produces any material freight shipments, has been before the I. C. C. asking for action to give increased freight facilities to handle the output. Of all that have appeared only two have been given relief, one the coal industry, which had special preference orders of a kind issued some weeks ago, and the other the wheat farmers and elevator interests who appealed last week for 22,000 additional freight cars, and were rewarded by an order issued the following day instructing eastern railroads to turn over 24,750 freight cars to the granger roads. The I. C. C., besieged on every hand, is refusing to lose its head or become worried. Fuel for those sections which produce no coal of their own, and next the movement of basic food crops continue to receive the consideration they need.

Government reports on the butter market show the market steady under the depressing influence of unusually large Canadian imports which are said to be of good quality, and sought for storage in preference to domestic make. Some Danish and some Holland stock is also arriving, although not heavy shipments. Storage reports indicate comparatively small storage buying, and stocks on hand do not compare with stocks at this time last year. Note is made in the government report that the increase in cold storage holdings in June in the five chief markets was but little more than half as much as during the same month last year. There seems to be a shortage in butter production this year. The production figures are not available, but this is indicated in many ways, and chiefly in the way the market holds up under other adverse factors.

A strong organized effort is apparent to create sentiment between now and December for the Welty bill, to establish a National Immigration Commission, and begin a systematic effort to limit and scrutinize immigration to this country. The Welty bill H. R. 14196 was introduced just before the adjournment of the last session. It is sponsored by the National Committee for Constructive Immigration Legislation, a national organization of which Henry W. Jessup is chairman and Sidney L. Gulick, secretary. The bill provides for a study of the needs of each state for immigrants, a study of the origin of the people seeking admission, and a means of limiting applicants to those who can be assimilated, and whose place in American life and industry is assured before they come. The bill shows careful preparation and is a distinct step in advance in constructive study of this grave national problem.

Captain George A. C. Hearsey of Palia Ranch, Oudh, India, has been the guest of the Department of Agriculture this week. He is just out of English army service and is going back to his Indian ranch to establish there a great agricultural industry. The ranch contains fifty square miles of fertile land. His trip here was to get in touch with dairy matters in particular, as he states that the Hindoos refuse to eat imported cheese because of religious scruples against the rennet used made from calves killed not in accordance with their religious rites and ceremonies. The same objection goes to imported meats, and he proposes to establish a beef industry there where the meat will be killed as the natives demand. Before going away from the United States, Captain Hearsey will visit the Middle West and South to acquire information as to American methods of beef cattle production and cotton and rice production.

Your correspondent has been promised an early visit to the dairy herd and experiment station of the Dairy Division at Beltsville, Md., where among other important and interesting experimental and research work in progress, there is one project under way which is of the utmost importance to the entire dairy industry. I refer to the work of Professor Meigs on the physiology of milk secretion and nutrition of dairy cows. This work has been carried on now to the point, I have been informed, where the definite relationship between the mineral content of the ration, the mineral acids in the blood, and the amount of milk secretion has been established. The object of the work is given in one of the department publications as follows: "To obtain definite knowledge of the mechanism of milk secretion and of the factors which influence or control this function, with a view to the more logical breeding and feeding of dairy cows." It is apparent that these experiments have close relationship to both feeding and breeding work, and that the success of this experiment has great potentialities in the whole milk industry. I am not sure whether or not I will be permitted to write as to results, but I can at least direct attention to the factors of the problem which are being considered, and indicate when and where the final results may be known.

Attention, Buttermakers!

The management of the Wisconsin State Fair has an excellent cold storage and exhibit room for dairy products. A large butter display is desired. Each buttermaker is requested to send a 20-lb. ash tub to this exhibit. The prizes and bonuses are liberal. If we do our part we will have an exhibit worthy of our state and of the men who make the butter. Let's see what we can do.

C. J. DODGE, Supt. of Exhibit.

When You Want a Good Farm—

—permit us to submit our list of desirable farms in Western New York, well adapted for stock raising, dairying, or fruit and truck farming.

Good markets available, good roads, splendid soil.

In dealing with this Trust Company—established 1881—you may be assured of full protection of your interests.

Write for booklet "Farming in Western New York."

REAL ESTATE DEPARTMENT

BUFFALO TRUST COMPANY

449-455 Main Street

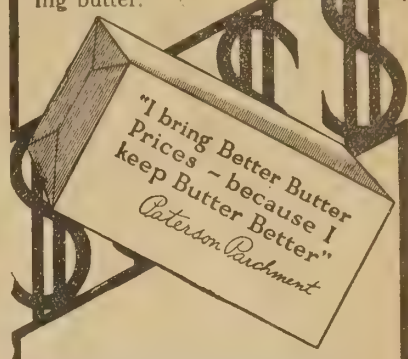
Buffalo, N. Y.

Columbia Fly Killer

kills every fly it strikes, also destroys lice on animals and poultry. If your dealer won't supply you send direct. Sent prepaid on receipt of price. ½ gal., 90c; 1 gal., $1.50; 5 gals., $6. Salesmen and agents wanted.

F. C. Sturtevant Co., Hartford, Conn.

CORN HARVESTER



That beats them all. One horse cuts two rows. Carries to the shock. Worked by 1, 2 or 3 men. No danger. No twine. Free trial. We also make Stump Pullers and Tile Ditchers. Catalog Free. Agents Wanted.
H. S. BENNETT & CO., WESTERVILLE, OHIO.

Ohio Farms Write for catalogue. 600 farms any size and price U want in seven different Co's.

H. H. MASTERS, Farm Agt., - Cambridge, Ohio

Increase Your Butter Profits

Money-making dairymen everywhere are looking to the *quality* and *cleanliness* of their butter. They know butter brings top market prices when it is clean, sweet and pure. They know that their trade increases in proportion to their care in wrapping and protecting butter.

Paterson Pioneer Parchment Paper

makes butter *taste* better, *keep* longer and *look* more appetizing. And don't forget that *looks* go a long way toward selling butter profitably. The best protection for butter and for good butter prices is Paterson Pioneer Parchment Paper. *Prove* it today.

Write for free samples and booklet "Better Butter". Contains money-making ideas for every dairyman.

Who Owns Gridley's?

The Gridley Dairy Co. of Milwaukee is a strictly Wisconsin enterprise, built with Wisconsin money, and more than 90 per cent of its present capital stock is owned by people in the company's employ. Not one dollar of this stock has ever been owned or controlled by outside influences or capital.

John LeFeber
President

EDITORIAL COMMENT

FARMERS' PICNICS

Since the advent of county breeders' associations and the farm bureau, farmers' picnics have become more numerous. The automobile has made it possible to hold county picnics and it is not uncommon to attend gatherings of five or more thousands. Some of the picnics we have attended have had ball games, horse races, men's and boys' races, merry-go-rounds, and various other attractions. Invariably they have a program with two or three speakers. These occasions become sort of a three- or four-ring circus and afford entertainment as well as instruction.

We consider these occasions highly desirable for they bring farmers and their families together, affording an opportunity to become better acquainted and to gather useful information which should encourage them in their work. The life on the farm has been too strenuous with too little opportunity for social affairs, but the automobile has made it possible for farmers to get together the same as the people in the city and it makes farming more inviting.

We would offer, however, a suggestion to those who have charge of these picnics. We think it would be well if each county could own a tent so that the speaking and entertainment could take place under cover. It should be located away from the horse races, ball games, and merry-go-rounds, for when the speakers' stand is placed in the midst of all attractions, it makes it almost impossible for a speaker to reach his audience. Further, if the day is rainy, the tent will afford protection. Some counties already own tents. We attended a picnic recently that would have been disturbed very materially by rain if the crowd could not have sought shelter under the tent.

TRUTH IN PHOTOGRAPHY

Comment on the subject of truth in animal photography is stimulated by the recent receipt of a consignment of pictures from a prominent breeding establishment. By these photographs low backed animals are given the appearance of being straight lined, high rumps are cut down, low tail heads are made smooth, small udders are enlarged and squared up, every weak point being covered by the artist's brush.

Such photographic surgery is deception. Why is a false appearance given to an animal's published likeness? Are these animals so defective that they cannot stand a fair inspection? Did the breeder who mailed these photographs desire his live stock reproduced as it is or does he prefer having the photographer make it look as he thinks it should? Sometimes it happens, even, that the changes brought about may not be improvements —the animal may have a better appearance on the honest, untouched negative.

Breeders place the blame for retouched pictures on the camera man, and the latter lays the guilt at the door of the breeder. He claims that some breeders are not satisfied with photographs showing their animals as they are, defects and all, and cites many instances as proof.

Wherever the fault lies, the practice of retouching should be done away with. It is Hoard's Dairyman's purpose in publishing photographs to inform its readers of the type of dairy animals in other herds than their own. We desire to stimulate the ambition to own as good cows as those reproduced on our pages. And we want photographs to be honest representations of the originals.

The "Agricultural Gazette", London, has the following pertinent remarks on this subject:

"At one time the average member of the public valued photography as a means of illustration, because it was believed that the camera gave a genuine and absolutely truthful result, whereas a drawing or sketch might be varied at the will of the artist. Gradually it became known that photographs were not necessarily truthful—people were made to look much younger in their photographs than they really were, and so it came to be said that 'Photography cannot lie—but the photographer can'.

"This retouching or faking was soon applied to the photography of animals. Legs can be shortened, backs straightened, hollow parts filled in, and protruding parts removed; so that the photograph, instead of representing the animal as it really is, may merely represent it as the photographer thinks it ought to look, or as the owner would like others to think that it is.

"The result is unfortunate, but most unfortunate of all to the owner of good stock.

"The whole purpose of photographic illustration is to show what the animals actually look like; so, as far as possible, to put anyone who sees the picture in the position of looking at the animal itself. But if that person has any idea that the photograph is other than absolutely unfaked, he at once discounts its value. Consequently, seeing that few people interested in live stock nowadays are ignorant of the prevalence of faking, it should be obvious that the owners of good stock are losers by the practice because the photograph of a good animal should need no faking."

SOLVING MILK PROBLEM

The Michigan Milk Producers' Association has attempted to inform the consumer regarding the expense connected in the production and delivery of milk. The members of this association do not believe in strikes because they are too expensive and do not produce the results so highly desirable both to the producers and consumers.

The consuming public must be informed regarding the food value of milk and the amount of effort required to produce dairy products. The consumer is not particularly concerned about the cost of producing milk, although we consider it wise that he have a general idea of its cost. The main point the consumer is interested in is, what is the milk worth to him.

The Michigan Milk Producers' Association has followed a constructive policy and has been the means of establishing what is known as the Detroit Area Milk Commission and through this commission has established a confidence between the producing and consuming public and has avoided milk strikes. This commission is made up of both producers and consumers and the milk problems are presented to this body.

Besides this work, the association has protected the dairymen's market and is now carrying on a campaign to inform the consumer regarding the food value of milk and its products. It seems to us that all milk producers' associations could well afford to put forth effort to inform the consumer regarding the value of dairy products, the cost of milk production, and what it will ultimately mean if continual attempt is made to depress prices of milk. When the consumer appreciates the food value of milk and understands all the operations back of its production, there is going to be less complaint regarding its present prices. The Michigan Milk Producers' Association is to be commended for the services it has rendered to its members and to the consumers, especially in Detroit.

FARM AND CITY

The condition of our times has led us to exaggerate our problems and to view our situation with fear rather than from the basis of facts. The apparent high wages and short hours prevalent in the city have, without doubt, encouraged many farm bred boys and girls to leave the farm. This movement from the rural districts to the city has produced a shortage of labor on the farm. There are those who believe this a calamity and almost irreparable, but we do not view the situation with alarm. When economical forces swing, as they are bound to, in the opposite direction from which they are now operating, the young men and women of the farm will see the advantage of taking up agricultural work.

Most young men who leave the farm will not return to it but some will see that high wages and short hours are more or less a delusion and that if they are to make any progress in the accumulation of wealth it will require greater effort and a better opportunity for saving than is afforded in many of the positions in the city which now seem to be so attractive. We may have reached the time in our efficiency of production where we can hope to make more than a living on 8 hours a day but it is a noticeable fact that the men and women who have accumulated some wealth have worked many more hours than this every day. Seventy-five cents to $1.25 an hour looks very attractive to the farm boy and 8 hours a day appears to him as being a snap. He fails to comprehend that rent, food, and clothing are much more important factors in the city than in the country and when he must pay the advanced prices for all these essentials he has very little left and that which he has left after paying for these necessities is very likely to be spent for the attractions of the city. The eight hours a day labor do not include the time spent going to and from work; in the large cities this means an hour or more every morning and evening.

We have met several men of late who claim, notwithstanding they are earning seven and eight dollars a day, that the amount they are able to save in the city is not as large as in the country where the expenses are less and the opportunities for saving are greater.

If the young men and women continue to leave the farm in the future as they have in the past year or two there will be less food produced and the prices will be higher, making it more difficult to earn a living in the city. We do not believe there is any law or regulation that will cause these people to stay on the farm. As sure as night follows day, the unyielding economical law will bring about conditions to keep young people on the farm long before any calamity will come to agriculture.

PRODUCTION AND MARKETING

Much effort has been put forth by our experiment stations and various other agricultural agencies to secure and disseminate information which will lead to a lower cost of producing farm products. It has been pointed out that it is important to feed the soil in order to produce profitable yields of grain. There are certain fixed charges which cannot be eliminated whether the soil is rich or poor. It requires as much time to plow, harrow, and plant an acre of land low in fertility, one that will yield 12 bushels of wheat or 25 bushels of corn, as land that will yield more than twice that amount of grain. It requires as much stall room and nearly as much feed and work to keep a cow that will produce 150 lbs. of fat as one that will produce 300 or 400 lbs. Again and again these lessons and many others have been pointed out showing that the increased yield brings a much larger profit than low production. We must bear in mind these things.

But there is another phase of agriculture which has only recently had serious consideration and that is the marketing of farm products. Our system of marketing is a good deal like Topsy—it "just growed". The consumer has made certain demands which the middleman has sought to satisfy. The farmers have been slow to consider improvement in their system of marketing. They have produced their products; hauled them to the city without thinking that they might do something to facilitate a better system of marketing. There is a service to be performed between the producer and the consumer. This service may be performed by the farmer or by the consumer, but it is our opinion that both of these groups are too busy with their own affairs to devote very much time to distribution. However, there is opportunity for the farmer, through his organization, to see that his products travel more directly to the consumer, that they do not fall into the hands of useless speculators. On the other hand, the consumer can put forth some effort in assisting the farmer to get his products into the consumer's hands at the least expense. There is no farm problem of more vital importance to the welfare of agriculture than to build up an economical system of marketing farm products.

Good Whitewash Mixture

The recipe for the whitewash used by the Wisconsin Experiment Station for the poultry houses on the station farm is given by J. B. Hayes:

Slake quicklime with enough water to make a thick paste. While it is slaking add a pint of melted lard or other grease and a cupful of salt to a bushel of lime. Add enough water to bring the solution to the consistency of thin cream and strain through a piece of burlap. It is also advisable to add four ounces of some coal tar disinfectant to every gallon of the mixture.

Before the whitewash is applied it is necessary to clean the house thoroughly, remove the furnishings, and clean the floor. An application of one part coal tar disinfectant and one part kerosene oil to the roosts and nests will destroy the mites.

Rye in Ration

We have about four or five tons of rye that we want ground, and would like for you to give us a ration composed of corn meal, cottonseed meal, and ground rye. We are not feeding any hay at all. The cows are on a good pasture and are doing well.

Montgomery, Ala. L. T. M.

While rye is comparatively high in its content of digestible nutrients, it is less valuable in a dairy ration than some of the other cereals because of being less palatable. The amount which can be satisfactorily fed in a grain mixture is limited somewhat by this factor.

Such a concentrate mixture as 300 pounds of corn meal, 100 pounds of cottonseed meal, 150 pounds of ground rye, and 200 pounds of wheat bran should be satisfactory. If our inquirer cannot supply wheat bran, he can substitute this with an equal amount of ground oats or can grind alfalfa finely and mix this in the ration. One of the great values of bran, oats, or ground alfalfa in such a mixture is to lighten it somewhat so that it is more easily masticated.

The roughages supplied are quite as important as the particular kinds of concentrates fed. If pasture is good, it may not be profitable to feed hay at this time, but if the pasturage is not wholly satisfactory it will pay to feed liberally of such legume hays as clover, alfalfa, soy bean, or cowpeas.

Phosphorus and Soils

HOARD'S DAIRYMAN:—Soils were provided by nature in the beginning with varying amounts of phosphorus and they will never hold any more of this fertility element unless man adds it directly in one form or another. It is impossible, of course, to build up the phosphorus content of soil by growing special crops as one may do in the case of nitrogen. Green manures return nothing to soils in the way of phosphorus save that which they have taken from it in their growth. Barnyard manures carry small amounts of this element but not as much of it as was contained in the foods from which the manures were made. Every crop that goes to market removes from the farm a considerable amount of this element. Over against this loss may be set, of course, the gain that comes from feeding grains that have been purchased, but as very much more grain ordinarily is sold than purchased the balance of such operations results usually in loss. The fact is that soils everywhere tend to grow poorer and poorer in this important element.

Soils which have been remarkable always for their fertility are fast approaching—and some of them have already reached—the point where lack of phosphorus is becoming the limiting factor in productiveness. The effect is to be noticed in smaller crops of ripened grain than the appearance of the growing crop in midsummer would seem to indicate. Soft corn, owing to lack of phosphorus for bringing the kernels to maturity, is sometimes an indication that soils approach the danger mark. Regarded from any point of view steady loss in this element is certain, and the loss in question constitutes a serious menace to future fertility.

Throughout the corn belt farmers are buying rock phosphate in increasing quantities to replenish the phosphorus in their soils. The Illinois Agricultural Association has contracted for and is directing the distribution of thousands of tons of this substance containing 13 per cent of phosphorus. Each ton of such rock carries at least 260 lbs. of this fertility element or the phosphorus equivalent of 130 tons of manure. Some farmers are using a ton to the acre, an amount that will supply the phosphorus needed for ten or a dozen good sized crops of corn. Others are applying 1,000 lbs. to the acre over the entire farm. Where the smaller applications are being made it is the plan in most instances to add a similar amount in five or six years from now. Rock phosphate is slow to give up its phosphorus, but through the building up of soils in organic matter by use of green manures, wastes, and crop residues the process of solubility is hastened.

Illinois. ORIN CROOKER.

Jointer Makes Better Plowing Job

HOARD'S DAIRYMAN:—I notice that the gardener who wants the very best possible job of plowing done has a jointer on his plow. We farmers are apt to think that a jointer has no place anywhere else and so leave the man who turns under all weeds, manure, and so on for onions and melons to use the jointer.

I am discovering that the jointer is a farmers' plow attachment. This year, outside of a few acres of new ground, the jointer was used for every kind of plowing. I had corn, strawberries, tomatoes, onions, and potatoes. I notice that the best plowmen in this neighborhood use jointers. I notice that there is little if any straw or weeds sticking over the edge of the furrow after they have done a job of plowing, too. When one uses a small tooth cultivator or a wheel hoe on crops he will appreciate the soil turned with the jointer more than any other time. Yet even in the cultivation of corn many old stalks can be pulled up with the cultivator teeth if they are not well turned under.

A jointer takes a small furrow just in front of the main plow and turns that furrow completely over into the cut made on the previous round. That leaves a clean edge to turn over because a cornstalk or weed must turn over with the jointer furrow.

I have a jointer with a round shank. This is the first one I ever used so made, but it is easier to adjust than the flat ones and is much stronger. I like to set the point of the jointer about an inch to the left (with right hand plow) of the edge of the landside of the plow. This gets all of the trash better, I think.

It seems to turn a jointer furrow over better if set on its tip or nose a little more than one would think necessary. This leaves the moldboard of the jointer with more curve against the furrow; it takes and turns the jointer-furrow better. I also like to set the jointer just as low as possible. The round shank on the jointer allows every sort of an adjustment and no wedges or nails of any sort are needed.

This attachment cost me $2.50. Probably it would be $4 by this time, but it is worth it. Tractor plows have them and there must be a reason for that. Jointers help to make a smoother and cleaner plowing job. They throw a furrow edge over so there are less lumps, too, and that is a desirable result.

Ohio. EARL ROGERS.

Handling Manure in Summer

HOARD'S DAIRYMAN:—It is always a temptation to let manure pile up—be it summer or winter. In the warmer months, however, when field work claims so much attention, the tendency to do this is perhaps greater than at other seasons. However, this is the time of year when one can least afford to permit fertility elements to remain idle. It is also the season when loss through fermentation is likely to be greatest. A heap of barnyard waste that stands through any considerable period in midsummer is apt to become a mighty uncertain asset, especially if it receives no better protection and oversight than is customary on most farms.

In distribution of manure in midsummer one should not overlook the advantage of applying the waste directly to meadows and other available grass plots. No other crop, perhaps, can make better use of manure in small quantities than the grasses. Owing to their intricate and delicate root systems they respond almost immediately to its touch. Grasses pick up and store away large quantities of fertility elements. In this condition such elements are locked away so that they cannot escape either in the air or in the drainage. Nature keeps them busily employed. It is no failure in economy to fertilize grass plots in midsummer which one plans to plow in the fall or spring. To store the manure away until just before the plowing is done is to subject it to loss. If applied directly to the grass in small amounts thinly spread practically no loss will occur. Rains will wash the soluble elements directly into the soil where the grasses can utilize them. If the manure dries up under the effect of the sun nothing is lost except moisture. Direct sunlight renders inactive the bacteria which cause heating when the manure is left in a pile.

Illinois. ORIN CROOKER.

How Efficient is Your Milk-making Machinery?

HOARD'S DAIRYMAN:—Foremen of manufacturing establishments must see to it that all machinery under their care is well oiled, polished, running smoothly, and highly efficient in its operation in order that the company that owns it may secure a fair return on the investment. Every dairy in this country should be conducted on this same principle. How many dairy farmers consider each one of the cows in the herd a machine that must yield a certain return in order to justify her existence and continued feeding and care?

When labor is $4 per day would you, Mr. Dairyman, be willing to have your hired men do only boys' work—or half what a man should do? Why should consumers pay 16c per quart for milk from 4,000-lb. cows when 8,000-lb. cows could be had if the dairymen were "on the job" as they should be? We know that 16c per quart is a relatively low price for milk but in these days when the dairy situation in some sections of our country is in a rather crucial state, the dairymen must have a "clear case" and convince the city folks that practically every dairy represents a highly efficient organization, even though in some cases the number of cows kept is small. The man who milks 3,000- and 4,000-lb. cows should be "frozen out" once and for all time. The term "dairyman" cannot properly be applied to him.

Increasing numbers of city councils and boards of health are raising the requirements regarding milk which may be sold to the public. More and more, the city milk supply will have to be produced from tuberculin tested cows that are kept and milked under strictly sanitary conditions. High priced labor and feed must not be wasted on "loafer" cows. In a recent editorial, Hoard's Dairyman hit the bull's eye when it stated that "about all the poor dairy farmers are doing is to produce enough milk to hold the market price of dairy products to a point that makes the good dairy farmer scratch to make a reasonable profit. Dairy farmers should either keep good cows, provide them with good rations, give them good care, and follow generally good dairy practice or go out of the dairy business."

Here is food for serious thought. The fruit growers are spraying and pruning and taking precautions as never before to secure a high quality product which brings them a good price. This price is very little affected by the inferior fruit put on the market by the small would-be orchardist. Shall the followers of dairying, which is recognized by many as the most important branch of agriculture, neglect to take the necessary precautions in order that their business may be highly organized and markedly efficient? We anticipate that someone will immediately rise up and say that the labor shortage is the bugaboo and that if he could only obtain competent help at reasonable wages he would observe all of the practices which efficient dairying now demands. It is sadly true that lack of the skilled help required in up-to-date dairies today constitutes a serious handicap; but at the same time what phase of agriculture will yield a bigger return on the labor cost connected with it than will well managed dairying? In a recent two-year survey of 260 farms in Greenbrier County, West Virginia, it was ascertained that the 90 beef farms, containing an average of 396 acres, made a family income of $1,590 and a labor income of $94. The 121 general farms, containing an average of 158 acres, made a family income of $532 and a labor income of (minus) $60. The 20 dairy farms, containing an average of 156 acres, made a family income of $1,268 and a labor income of $366. Thus it would seem that the dairy farmer can expect a considerably larger return for labor than can some who are engaged in a number of the other lines of agriculture.

To what nobler and more constructive purpose can dairymen direct their energies than to the great betterment of the dairy industry? The dairy cow, that "foster mother of mankind", has ever been and will continue to be a distinctly essential factor in the life and continued development of this and every civilized nation and she is therefore deserving of the best possible care and attention. As dairymen who are anxious to uphold the dignity of our calling and ever help to improve and perpetuate our business let us resolve to

Adopt systematic and economical feeding.
Drive all scrub bulls to the shambles.
Verify the worth of every cow by keeping records.
Advertise the cow and her products.
Never relax interest in the work.
Capitalize quality in both cows and their products.
Eradicate contagious diseases.

West Virginia. E. J. PERRY.

Oregon Imports Guernseys

E. K. HILL, Secretary Oregon Dairy Congress

THE Pacific coast states are taking an interest in improving their dairy herds and to attain this object they are giving especial attention to breeding. The importation of 59 fine Guernseys from the Island of Guernsey was a recent event in Oregon that attracted the attention of the public to the fact that Oregon is forging to the front in the dairy industry.

E. L. Westover, field dairyman of Oregon Agricultural College, went to New York, met the Guernseys from the Island, and brought them to Oregon. They were placed in the Pacific International Livestock show building for a short time and were distributed by lot on June 28 to members of the Oregon Guernsey Cattle Club. Tillamook, the county that is famed for its wonderful cheese; Clackamas County, where the Jerseys and the Holsteins and the Guernseys all have enthusiastic owners; Coos, another great dairy and cheese district; Washington and Clatsop, way up in the northwestern part of the state; all got lucky numbers and drew some valuable cattle.

In this lot is some of the best breeding of the Island, backed by high production and good type. sire and backed by high producing records. His dam has a record of over eleven thousand pounds of milk, 600 pounds of fat, as a two-year-old and calved 30 days after the test was completed. His grandams have an average production of 14,298.75 pounds milk, 739.29 pounds fat. His two grand sires have over 120 Advanced Registry daughters and 24 Advanced Registry sons.

Guernseys are gaining in popularity very fast and the demand in the Middle West and East far exceeds the supply. The Oregon Guernsey breeders feel that they are fortunate in being able to secure such a high class lot of animals. They will be foundations for building up great Guernsey herds in the different sections. Many of them will be shown at the state fair and the Pacific International Stock Show next fall.

A Washington (state) cow that is creating a sensation is Duenota 2d (31462) who has just completed a re-entry record of 12,781.2 pounds of milk and 708.06 pounds of butterfat. She is owned by H. B. Douglas, Hope Farm, and is the oldest daughter of his foundation cow, "Duenota".

To Duenota 2d goes the great honor of being the first Guernsey cow in

THERE WERE 59 OF THESE GUERNSEY BEAUTIES IMPORTED BY THE OREGON GUERNSEY CATTLE CLUB

They are close descendants of the great old Island cow, Valentine III, who has an Island record of 15,477 pounds of milk, 783.10 lbs. of fat, also several animals that contain a large percentage of the Golden Secret breeding, close descendants of the great cow, Nelly Joy 4th, who has a record of 20,709.90 pounds of milk, 1,019.25 pounds of fat, a record made in America. Many of the animals are closely related to the Island cow, Fleurie III of the Cloture, a cow that has an Island record of 14,805.75 pounds of milk, 757.72 pounds fat, made at nine years of age. On the sire's side the animals are close descendants of such bulls as Imp. Sailor Boy, whose three-year-old daughters have an average production of 11,010.98 pounds of milk, 553.30 pounds fat. There are several granddaughters of Imp. Clara's Sequel, a bull that had thirty-two Advanced Registry daughters whose records run from 532 pounds fat as two-year-olds to 682 pounds of fat as senior three-year-olds.

Sires of other heifers are Imp. Roberts Boy, whose three-year-old daughters have an average production of 10,000 pounds milk, 488.21 pounds fat; Imp. Sailor Boy, whose three-year-old daughters that have been put on test have an average production of 11,010.98 lbs. milk and 553.30 pounds fat; and Duke of Waumesit, a bull that has eleven Advanced Registry daughters.

Two other bulls that are sires of many of the heifers are Golden Noble IV of the Briquet, a prize winning the state of Washington to make 700 pounds of butterfat.

She made this record in her 12th year, which shows the remarkable persistence and productiveness in age of the Guernsey cow and especially of the Duenota family.

It is worthy of note that her record was made under ordinary conditions and she was pastured with the herd whenever the season permitted and occupied her usual stanchion with her stable mates. Hope Farm is a working industry and Mr. Douglas believes strongly that the Guernsey cow can produce a creditable record and still be a strictly paying dairy proposition.

New York Butter Market

NEW YORK CITY, JULY 13—This is indeed a very peculiar year in butter markets. On the surface it appears that there is a marked scarcity of butter and that prices should continue high and the market active for many months to come. However, there are at intervals marked periods of depression for which it is difficult to make satisfactory explanations. Reports on holdings in public warehouses show that approximately 9¾ million pounds of butter are stored away at present as compared to 21½ million pounds one year ago. Receipts are considerably below those of last year and have been since early in the year. Why there should be such periods of inactivity is beyond solution by the ordinary individual who is in position to watch the trend of the market.

One factor at present which is causing a somewhat nervous feeling among butter receivers is that of butter imports. While until the present time comparatively small amounts of Holland and Danish butter have been received in this country, vast cargoes are headed this way at the present time. It is expected that fully 40,000 casks of Danish butter, aggregating close to 4½ million pounds, and 12,000 to 15,000 casks of Holland butter, approximately 1½ million pounds, will be unloaded here before the end of the week. That quantity of butter at one time can not fail to have a material bearing on butter prices for a temporary period at least. There are reports, however, which tend to offset the pessimistic feeling engendered by the near arrival of so much butter. Those reports are: Holland has placed an embargo on exportations of butter because of domestic demand, and England has contracted for 9,000 tons of Danish butter to be delivered during the coming months. If those reports are accurate, it is very probable that very little butter from those two countries will be shipped to this country for some time to come. A quantity of Argentine butter, aggregating 3,654 boxes, was received here last week. As that butter is of inferior quality, netting the shippers from 46 to 50c, it is considered as having no material bearing on the market.

At the present time the market is passing through a slump. The price fall, however, is not in proportion to the inactivity on the street. Receivers are unwilling to sell their butter at lower prices and most of them are holding on to the supplies which they have on hand. In many instances, receivers have their boxes full and in order to make room for incoming shipments are sending the butter to public warehouses. They seem to feel that the present slump is but temporary and that they will be well repaid for the cost of placing the butter in storages. The most noticeable feature in the market at present is the lack of demand for undergrade butter. While that condition has obtained more or less for some weeks it is particularly acute at present. As a result the range of prices of undergrades is constantly widening. The quality of butter on the average is considerably below normal for the season which accounts in part for the apparent lack of demand for firsts and seconds.

Last week witnessed a very fluctuating market so far as purchasing activity was concerned. Immediately after the holiday the market was very weak and the price fell 1c. On Thursday, a greater activity developed and the price advanced ½c and a similar advance took place on Friday. A weakness was at once apparent on Monday and the price fell ¼c and on Tuesday an equal decline followed. There is very little buying at the present moment and further declines are expected. Quotations are: Extras (92 score), 57@57½c; higher scoring than extras (93 score or higher), 58@58¾c; firsts (90—91 score), 54½@56½c; firsts (88—89 score), 52@54c; and seconds (83—87 score), 46@51c.

W. B. LIVERANCE.

Rockwell Chicago Secretary

Announcement is made that E. C. Rockwell is now secretary of the Chicago Milk Producers' Association. W. J. Kittle, who has served in that capacity from the early activities of the association, resigns to become head of the Chicago Milk Producers' Co-operative Marketing Co. His work will be the selling of the milk shipped in by the producers to their association.

Have You Seen That New John Deere Plow?

It's Built Especially For the Fordson Tractor

Because it is built of new-process John Deere steel, the No. 40

weighs less than the average horse-drawn sulky plow;

pulls extremely light—a real fuel saver;

stands the strains under all conditions — its beams are guaranteed not to bend or break.

Due to the self-adjusting hitch—an exclusive John Deere feature—bottoms run true and level at all depths — they neither "nose in" nor "hop out" of the ground.

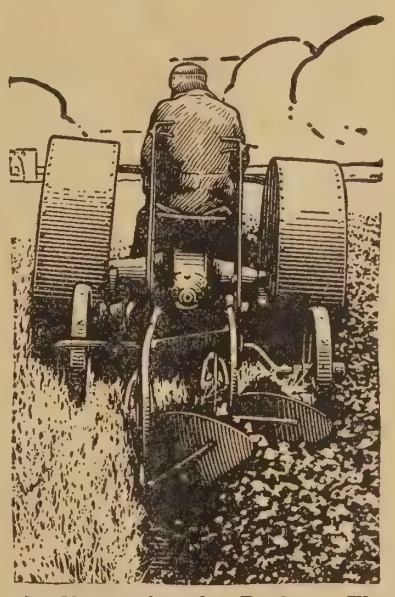
Its John Deere bottoms insure good work.

YOU have been hearing for some time, no doubt, that John Deere was building a new plow especially for the Fordson tractor.

Perhaps you are one of the many farmers who asked that John Deere build such a plow.

Perhaps you are one of the many who have gone to John Deere dealers with the query: "When can I see that John Deere plow built especially for the Fordson?"

John Deere specialists took their time in building the plow. They had the John Deere reputation to consider, first of all. They knew that farmers expect especially good performance from a John Deere plow. Their task was to give the user the benefit of such performance behind his Fordson tractor—to fit a John Deere-quality plow to the Fordson as carefully as a good tailor fits a suit of clothes to a customer.



The plow is now ready. It has been branded with the famous John Deere trademark of quality. It is called the John Deere No. 40.

Here Are Features That You have been Wanting

Imagine a two-bottom tractor plow that is lighter than the average horse-drawn sulky plow—

—a tractor plow that pulls so light that it soon pays for itself in lower fuel consumption, greater acreage per day, minimum wear on the tractor—in all the factors that mean lower plowing cost per acre—

—a tractor plow that has this desirable light weight and light draft **plus** tremendous strength—**beams that are guaranteed not to bend or break;** frame construction that stands all of the strain of utilizing the tractor's power under all conditions.

The No. 40 fits the Fordson. The No. 45 is built for use with ANY "two-plow" tractor.

Those are important features of the No. 40 that you are sure to appreciate.

Beams, braces and axles are made of a **new process, John Deere steel** that combines the desired lightness with the necessary strength.

It's the Plow with the Self-adjusting Hitch

The No. 40 has a self-adjusting hitch—an important advantage in plowing with the Fordson.

When you adjust the plow for depth with the depth lever, the hitch point automatically regulates itself to the correct line of draft. That means that the bottoms run true and level at all depths, doing uniformly good work all the time.

It means that there is no undue wear on shares because of bottoms "sledding" or "running on their nose"; no worry or loss of time over hitch adjustments.

The self-adjusting hitch is exclusively a John Deere feature. Any plow for use with the Fordson needs it, but—**no other plow has it.**

John Deere Bottoms do Good Work; Wear Well

The No. 40 is equipped with genuine John Deere bottoms—the bottoms that scour, wear well and make good seed beds.

These bottoms include both steel and chilled types in a variety of shapes to meet different requirements.

The shares are quick detachable—loosen one nut to remove a share: tighten the same nut and the share is on tight.

The power lift of the No. 40 is simple, strong and positive. It works perfectly. The lifting parts move only when the plow is being raised or lowered—practically no wear.

This is the Plow the Fordson Needs

If you are planning to buy a Fordson tractor, it will pay you to investigate the No. 40.

The tractor will give you pulling power. It will be up to the plow you buy to apply that power. Remember that, no matter how well a tractor may do its part, the plowing outfit is no better than its plow—just as no knife is better than its blade. You need the best plow you can get.

The No. 40 may be on display in your town now. If it isn't it soon will be. Get acquainted with it thoroughly before you buy your tractor.

The best place to judge the No. 40 is in the field. Watch it at work and see for yourself how wonderfully light it pulls; how simple and strong the hot-riveted frame construction is; how the self-adjusting hitch keeps the bottoms running true and level at all times, and how the bottoms scour, pulverize and turn the soil in that John Deere way—the way the practical farmer wants it done.

Another Plow for ANY "Two-Plow" Tractor

If you are planning to buy a "two plow" tractor other than the Fordson you will be interested in the John Deere No. 45. This plow is exactly like the No. 40, except that it has a flexible hitch and rear furrow wheel. It has the fuel-saving light draft, the strain-resisting strength, and the seed bed-making qualities of the No. 40. It is adaptable for use with any standard two-plow tractor.

Ask us to send you free booklets describing these lighter, stronger plows for "two-plow" tractors. Drop us a postcard or letter today. Ask for **booklets F-114.**

Lowe's

Cost of barn paint

A new way to figure it

Take a pencil and paper in one hand, and put down the cost per gallon. Take a brush and a half pint can of any paint. Now paint the side of your barn as far as the paint will go. Then measure the space, and mark it down.

Now take a half pint can of Lowe Brothers' Barn Paint, and do the same thing. In doing it, compare the ease with which Lowe's spreads on, and how thoroughly it covers. Take particular notice of how you can brush it out so much farther than the other paint.

Now measure the space Lowe's covered. Compare it with the other.

Then consider the reputation of Lowe's, with its half a century of paint making back of it, to back it up. After which, if you don't paint all your barns with Lowe Brothers' Barn Paint, it will be because of some reason all your own, that you don't want as good a paint as your money will buy.

Lowe Brothers' Barn Paint is sold by the one best dealer in each town. Send to us for some eye-opening paint facts and figures. They save you money.

Several Hundred Ohio Farms
For Sale

WE are offering several hundred of the best farms in Ohio at prices that are low in comparison to the value of the property and the income assured purchasers.

These farms are a part of the Miami Conservancy District, which is a political subdivision of the State of Ohio, and represent a surplus acreage that we own in the Miami Valley.

Rich silt loam top-soil deposits make this land very productive—practically inexhaustible.

It is our earnest desire to bring more good farmers to this community, which lies within a thirty mile radius of Dayton. Quick markets are available by rail, interurban and highway.

We Would Like to Send You Booklets Giving Detailed Information. Just Address "Farm Division"

THE MIAMI CONSERVANCY DISTRICT

DAYTON, OHIO

Where Farming Is Profitable

Farm lands in the South have not been boosted by speculation. Why buy a farm in a high-priced section and cripple your future with debt when you can buy a better farm in the South for one-third the price? Don't you want a farm where climatic and soil conditions are unexcelled? It is our business to help you find just what you want. We know Southern lands and land values and it is to our interest to locate you where you will succeed and make business for the railroad. There is no charge for our service. For full information call on, or write to J. C. Williams, Manager, Southern Railway Development Service, 1302 Pennsylvania Ave., Washington, D. C.

Water in the Stable a Necessity

THE "BUCKLEY" DEVICE

Is the leader. Why not use the best? Write to the manufacturers for a descriptive circular.

Poughkeepsie Foundry & Machine Co.,

POUGHKEEPSIE, N. Y.

An Americanized Dairy in Old England

(Continued from page 4)

lowed to enter it. They must pour the milk through into a receiving can outside which empties through a pipe in the vessels inside in which the milk is cooled.

Seeing all this on one farm I could not help but look back at my boyhood days on the home farm, when we were astonished at the audacity of the milk plant which had insisted on its patrons sweeping their stables, and of how we struggled from before dawn till after dark to make ends meet without being able to buy any equipment like I saw here. Then I yielded to temptation and asked Mr. Buckley if he thought it was practical, and if it was not merely the hobby of a rich gentleman-farmer. I shall let the master of Moundsmere speak for himself.

"Of course I have money," he said, "to do this properly, and I realize just what the farmer is up against, as regards equipment. But no man needs all this expensive equipment to get good clean milk. I have it because I am working not only for myself but for many others as well. I built these barns when the old ones burned down and, while they still owe me money, I think they pay because of their convenience and the pleasure of working in them. Besides they help to advertise Moundsmere Manor.

"When I returned from America I wanted pure clean milk for my little girl whose illness demanded it. It was practically unprocurable so we started our own farm to provide it. That was in 1907, and in 1910 at the request of a committee on pure milk my product was put on the market. I can say with some pride that ever since then, milk from Moundsmere Manor has been a basis for milk standards throughout the country.

"I now have plans for demonstrating to farmers in general how they can materially improve their milk. I don't care about them doing just what I am doing if I can but help them to put the production of clean milk on a sound, practical basis. Farmers are following me too and even at the beginning are achieving success."

That is true. The movement is spreading and is not confined to his own district. A farmer in Yorkshire hundreds of miles away is now producing milk that in quality rivals the product of Moundsmere Manor. Pure milk production has been made a subject of discussion in farm papers and from this small beginning has sprung into being the nucleus of a department of dairying in the national government.

When war came and the nation had to look ahead to conserve the food supply, a man to whom the nation could look as an authority on milk was needed in the dairy branch to superintend the distribution of milk to England's millions. Wilfred Buckley was the man chosen in preference to numerous college professors who were ready and anxious to take the job. In his London office he was able to do what he had wanted to do before. He not only carried the routine work of rationing the nation but also an educational campaign among the farmers, with the result that visible improvements were made during his tenure of office. Cow testing associations were encouraged, a system of inspection was evolved and had it not been for the heavy reduction of feed imposed by the government, that limited the farmers' producing ability, it is hard to say what the movement would have accomplished.

On his own farm he also carried out instructional work, holding regular classes for his employees. I attended one of these classes at which lantern slides were used to make it more instructive and interesting. During the war he had to depend on his help nearly all the time so it was essential that every man should know his job thoroughly.

This shows the comparative amount of dirt that falls into a small top pail and into an ordinary pail.

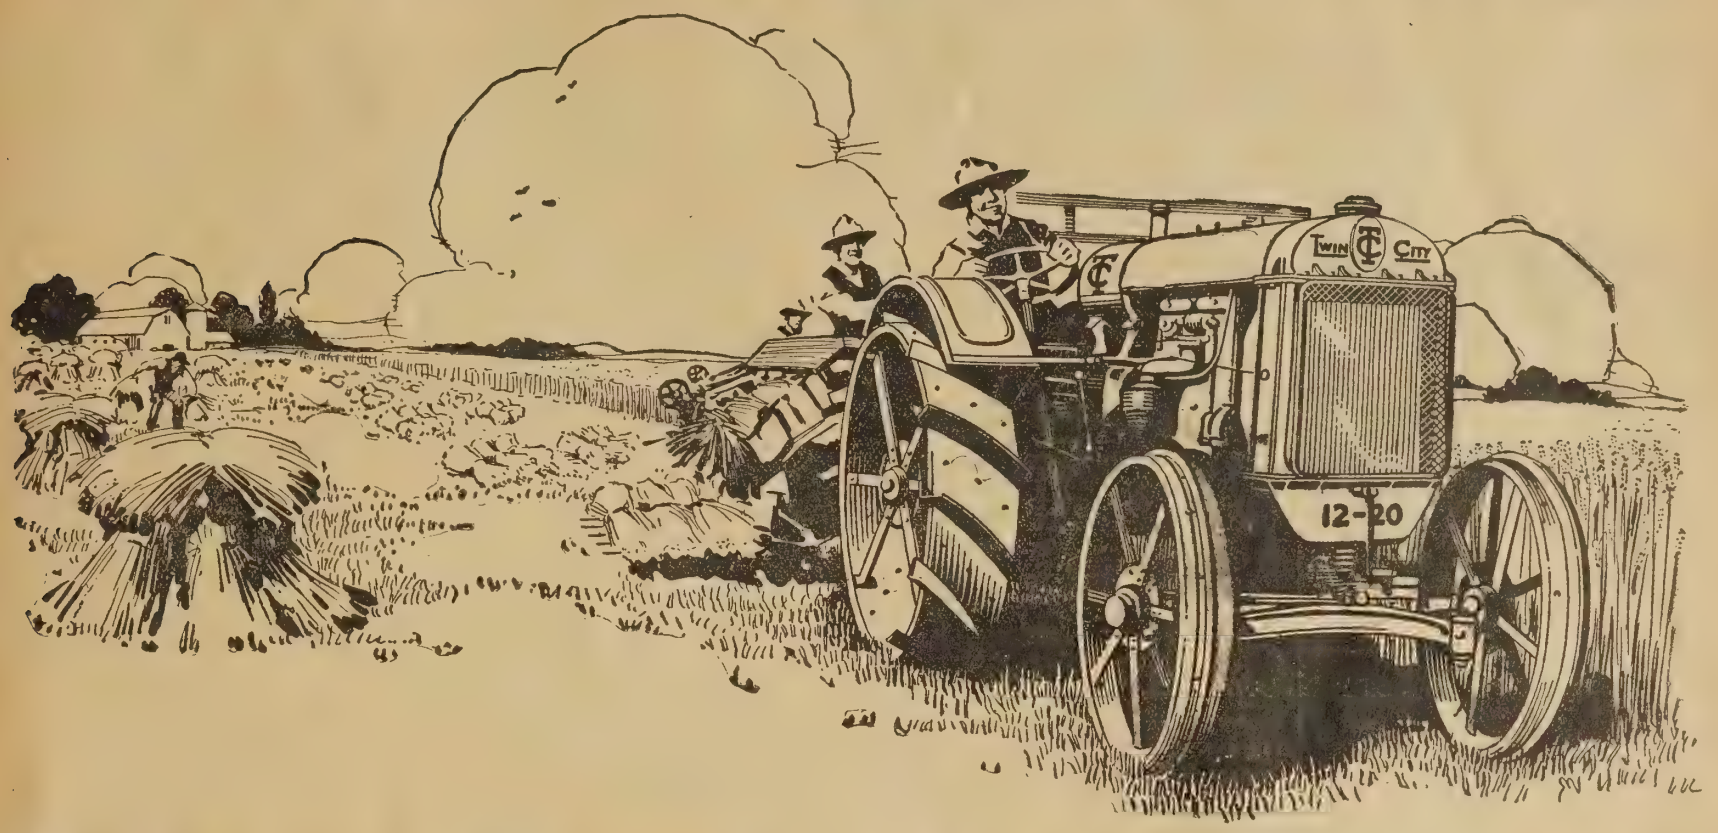
You have seen the results of Wilfred Buckley's American inspiration so far. But what is to follow? There will be a fight, and a long one, too, before his vision is completely realized. No revolution in any industry ever came about without one. So it is here. The man has been misunderstood and papers have called him a faddist, but victory is gradually coming his way and clean milk to England. The new milk laws which came into effect in March are a testimony to the success of the propaganda of the "faddist". These laws, as enumerated in Mr. Reece's article in Hoard's Dairyman of April 30th, contain many flaws, as is well shown in the Farmer and Stockbreeder, London, in its criticism of them in the issues of Feb 16th and Feb. 23rd.

We are told in history that Minerva sprang full armed from the head of Zeus, the father of gods, but that is the only record we have of anything being born perfect. English milk laws sprang in their infancy from the brains of Major Lord Astor and his staunch lieutenant, Wilfred Buckley. Time and experience alone can develop them to a vigorous and sturdy maturity.

Young Calves Do Best in Barn

Large numbers of calves are now on hand from the million and a third dairy cows in Minnesota. The owners are engaged in raising the heifer calves at least, and are doing so by hand, depending mostly upon skimmilk. In this connection one question is often asked—should the young calves be kept on pasture or are they better in the barn?

The dairy division of the university has tried both plans and finds the best results come in keeping the young calf in a clean place in the barn until about three months old.



For the first two or three months the young calf does not eat grass enough to amount to much and does better if given a little bright hay instead; furthermore, the young calf suffers from heat and flies and does not seem to be able to look out for itself. During this period, the calf is best kept in the barn or at most allowed to run in a dry lot near the barn part of the day.

For skimmilk calves three to six months old a small pasture near the barn where they can be easily fed and looked after is ideal. Shade and plenty of water should be supplied. A row of small stanchions suitably located are almost indispensable if many calves are to be fed together.—C. H. ECKLES, chief of the division of dairy husbandry, University Farm.

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

TWIN CITY

12-20 Kerosene Tractor with 16-valve engine

When Every Hour Counts

You know there will be no delays in haying, harvesting, threshing, or any tractor work on the farm, when you have the Twin City 12-20. You can clean up all these jobs at the right time—in quick time—and be ready for your fall plowing.

For there are no uncertainties about the Twin City. The best that tractor science has produced is built into this tractor. Its 16-valve (valve-in-head) engine delivers full power because it exhausts *all* burnt gases, leaving a clean cylinder for each new charge. This means more power from the fuel—more power applied to the work—real fuel economy you can see.

With the Twin City's great surplus power you have the rugged strength and light weight which only the finest special alloy heat-treated steels can give. It is built to do the work, not to meet a price. This means dependability year in and year out.

Removable cylinder walls for uniform cooling and quick and easy replacements—crankshaft counterbalanced and drilled for force-feed lubrication—all transmission gears of special alloy steel drop-forged and heat-treated, completely enclosed and running continuously in bath of oil—Hyatt roller bearings throughout.

There is a Twin City of horse power to meet the needs of every size farm: 12-20, 16-30, 25-45, 60-90. All-Steel Twin City Threshers have several exclusive grain saving features: 22-42, 28-48, 36-60. Write for details.

"No Flies On Me"
Twenty-Four Hour Protection

COWS will not produce large quantities of milk unless they are allowed to feed in peace and contentment. Flies torture them and when cows are not protected from these great enemies, they cannot yield the maximum quantity of good milk and butterfat. A single spraying of
KOW-PROTECTO
KEEPS FLIES OFF

not only at milking time, but for 24 hours. By spraying just once a day, you save a lot of time; protect the vitality of your cows and increase your profits through the bigger flow of milk. It is absolutely harmless and cannot taint milk or blister skin, yet flies cannot live where this liquid is exposed or applied, in pens, stables, yards, manure pits, etc.
25 to 35 Per Cent More Milk

Get Our Money Back Guaranteed Trial Offer-Prepaid.
Limited time offer. Send $1.25 for prepaid 1-2 gallon, enough to protect two cows 10 weeks. Or we will prepay one gallon for $2.00. State P. O. and Express Address.
Money Back If Not Satisfied

Young Sons of SIR BESS JEWEL ORMSBY
The records of his eight nearest dams average better than 30 lbs. He is a son of Sir Pietertje Ormsby Mercedes 37th. Dams are A. R. O. and untested daughters of Hillvale Sir Ormsby. Write for descriptions or come and see them.
T. J. Jones, - Wales, Wis.

FOR SALE
21 Head of Holsteins
16 Pure-breds and 5 Grades. Heavy milkers. Headed by a son of King Netherland Segis Konigen, the 43-lb. son of King Segis Pontiac Konigen. They are priced to sell. Address
BOX 269, - Care Hoard's Dairyman

A Good Consistent Pedigree
Isn't it worth more than a high record or two in a weak pedigree, which shows no certainty of transmitting Production?
We offer *3 SERVICEABLE BULLS* with good solid pedigrees.
No. 1—Double grandson of 40-lb. sire, from a 22.6 Jr. 2-yr.-old, 7 nearest dams average 23.7, all above 21 lbs. No. 2—Son of No. 1, A. R. O. dam, 15 nearest dams average 21 lbs. butter, 520 lbs. milk. All tested. No. 3—Yearling sired by No. 1, 7 nearest tested dams average 23.46. Priced for quick sale.
BROOKENS BROS., PARKER, S. DAK.

FOR SALE AND EXCHANGE
25 head of Holstein cows, 23 of which are high grade and 2 are registered. Also herd bull, a grandson of K. S. P. A., the fifty thousand dollar bull. This bull is from a 27-lb. cow. Most of these cows bred to this bull. All young cows and well marked, good heavy producers. Price $200 per head if the herd is bought together. Will take two good teams of draft mares or mules as a partial payment. Might consider a good automobile as a partial payment.
G. A. HIGGINBOTHAM, ROSSVILLE, KANSAS.

RIPPLEY'S FLY REMOVER SAVED $225
in milk for a customer who used it
On Five Cows for 90 Days
Kills and keeps off animals Flies, Mosquitoes, Ticks, Lice and all Insects. Cows give 25% more milk, as they are protected and fed quietly all day. Horses work and drive better, Hogs and Poultry are free from lice. No Gad Flies or Warbles to bother where it is used. 1 gal. and Sprayer for applying, $2.50; 5 gal. and Sprayer, $7.50; 10 gal., $12; 25 gal., $28; 50 gal., $55. Four gal. Sprayer for applying on Dairy Herds, $9.50. Money returned if animals are not protected. One gallon protects 250 cows. Order from ad, terms cash—catalog free.
Rippley Manufacturing Co., Box HD Grafton, Ill.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Bloat—Garget

1. About a week ago my calf three months old began blowing up. She is not constipated and her bowels move regularly. She is being fed 8 lbs. milk with boiled oil meal and oat meal twice daily. We have raised five calves before with the same feed. She also gets dried clover but does not eat very much of it.

2. We also have a cow fresh eleven days that gives 8 lbs. of milk to a milking and with her back teats gives thick brown milk. This cow is in very good condition.

Green Bay, Wis. J. E.

1. Physic the calf with castor oil in milk and then feed milk containing one ounce of limewater to the pint. Make the limewater by slaking a lump of caustic lime as large as a walnut in a quart of water. Let the lime settle and then use the clear liquid. Feed a little milk often from a sterilized vessel and make the calf drink slowly. Let it eat whole oats, wheat bran, and oil meal at will. Do not boil the feed or mix it in the milk. Have the calf take exercise daily. In case of severe bloat give half a teaspoonful of formaldehyde in milk and if necessary increase the dose.

2. The udder has been attacked by mammitis (garget) and the condition has become chronic and incurable. Under the circumstances it would be best to dry off the milk secretion and fatten the cow for the butcher. Meanwhile isolate the animal and milk her last, as such disease often is spread from cow to cow by the milker's hands. Cleanse and disinfect the place she has occupied.

Stringy Milk

Please tell me what to do for a heifer that gives stringy milk. It looks nice when you milk it but after it sets a while it is so stringy we can hardly hold it on a spoon. She had her teat split on a wire and had 5 stitches taken in it.

Pana, Ill. E. S.

It is quite likely that you will find that the heifer is not to blame for the condition of milk described. That often is caused by bacteria in the milk utensils, wash water, setting water, or from the dust of the stable, milk room, or setting room. Set a sample of milk from each quarter of the udder in a separate sterilized vessel to determine if all of it becomes similarly affected or if one teat really is giving abnormal milk. If the udder proves not to be at fault place a number of samples of the milk in separate sterilized vessels and to each add some possible carrier or container of the bacteria. For instance, in one put a little wash water, in another water from the setting tank, in another some stable dust, and so on until it is found that one sample becomes stringy and the source of contamination is discovered. Meanwhile more perfectly cleanse, scald, and sun dry the milk vessels and also keep the stable clean and cleanse the udder and teats before each milking.

Abortion

Kindly advise me what to do for abortion. Two of my cows recently aborted. Can anything be done to prevent it or to keep it from spreading?

Sparta, Wis. T. S.

At once isolate the two affected cows and then cleanse, disinfect, and whitewash the stable. Use a mixture of one part of compound cresol solution and 30 parts of water, or 5 ounces of formaldehyde and a gallon of water for the disinfecting work. A trained veterinarian should be employed properly to cleanse and disinfect the womb of each aborted cow and to show you how to flush out the vagina of affected cows and heifers that are to be bred. Until the veterinarian can be employed flush out the vagina of each aborted cow once daily with lukewarm, boiled water containing 30 grains of permanganate of potash to the gallon. Do this by means of a fountain syringe, or clean rubber tube, funnel, and nozzle. Also syringe out the vagina of each cow and heifer every other day for 2 or 3 weeks before breeding. When a cow that has aborted has again been bred continue the vaginal injections until it is seen that she is not going to come in heat again. This means that she should pass three weeks after service without coming in heat. After that the womb is tightly closed and likelihood of infection from outside is negligible. The sheath of the bull also should be flushed out with the permanganate solution before and after service. There is no specific remedy for abortion, but if you can have a trained veterinarian give the treatments suggested and carry out the disinfecting campaign persistently the contagion will be likely to die out in time.

Dairy Cow Race

At the Missouri State Fair will be scheduled what is termed a "real cow race". One thousand dollars is offered in premiums in each of two divisions in a production contest to be established during the fair week, one class to be made up of Jerseys and the other of Holsteins. It is expected that this will prove an interesting attraction for those interested in dairy cattle. The substantial purses offered in this "race" will stimulate this interest.

Red Water

HOARD'S DAIRYMAN:—I note that one of your readers writes with inquiry regarding red water, a disease of the urinary passage. I have found the following to be a very satisfactory remedy. For young stock, six months to a year old, give one-half pound salts, follow twice a day with one-half ounce tincture of gentian and same amount of tincture of iron and ginger. Do this for three or four days and allow a good grain ration. For older animals the above should be doubled, giving all tonic mixed together in warm water.

Kantonah, N. Y. H. H.

John C. McNutt Resigns

Professor John C. McNutt has resigned as head of the Department of Animal Husbandry at the Massachusetts Agricultural College. He will be the eastern representative of the Shorthorn Breeders' Association.

Professor McNutt came to the college January 1, 1916. Since this time the work of his department has been increasing in popularity among students both in the regular courses and in the various short courses. He has been especially successful in training student judging teams; these teams having won distinction not only in the East, but also at Chicago, and, on two occasions, individual members of these teams having won substantial cash scholarships in competition with college men from the entire country.

Professor McNutt has had immediate charge of the cows, horses, sheep, and swine at the College and under his direction a marked improvement has taken place in the quality of the stock. At the Eastern States Exposition of 1919 a number of prizes were taken by the live stock exhibited by the Agricultural College. Professor McNutt has been in close touch with the best live stock breeders of the state and as a result the College has received gifts of many valuable animals.

Professor McNutt is one of the foremost live stock judges of the country and has judged at some of the largest agricultural fairs in the eastern states.

Junior Judging at Iowa Fair

A new Junior Dairy Cattle Judging Contest for the 1920 Iowa State Fair has just been announced. This will be held the first Friday afteroon of the fair, after the general junior judging contest is completed. It is open to any boys or girls over 12 years of age and under 18. The contestants will judge a class of cows and bulls of the four dairy breeds, Jersey, Guernsey, Ayrshire, and Holstein. The three standing highest in this judging will be named to represent Iowa at the National Dairy Judging Contest held October 8 at the National Dairy Show in Chicago.

The dairy department at this year's Iowa State Fair in Des Moines, Aug. 25 to Sept. 3, will be the biggest of its kind ever held in the Middle West, fair officials state.

Prices Paid and Received by Condenseries

Prices paid producers for 3.5% milk delivered at factories during June are based on reports made to the U. S. Bureau of Markets by condensed and evaporated milk firms operating approximately 80% of the total factories in the United States:

Geographic sections	Firms reporting	June price per cwt. Range	Ave.
New England	4	$2.94—$3.52	$3.32
Middle Atlantic	96	2.60— 3.46	2.98
South Atlantic	6	2.60— 3.34	3.05
East North Central	115	2.31— 3.10	2.69
West North Central	11	2.50— 3.00	2.77
South Central			
North Western	19	2.40— 3.25	2.52
South Western	11	2.20— 2.80	2.45
United States	262	2.20— 3.52	2.80

Manufacturers' wholesale selling prices for May as given below are based on reports made by manufacturers covering actual sales of condensed and evaporated milk delivered to jobbers, wholesale grocers, and similar buyers at manufacturers' distributing points on basis of cash short time credit. Foreign prices are given as f. o. b. or f. a. s. points of export in section in which sales were made.

This Seventeen Year Old Girl Milks Twenty-seven Holsteins with the Perfection

TWENTY-SEVEN cows, especially when some of them give as much as 100 pounds in a day, is quite a bunch for a girl to milk. When Theodore Gillis' 17 year old daughter can handle them all alone with the Perfection, it's not hard to understand why Mr. Gillis thinks his milker is a wonderful machine.

Mr. Gillis has labor problems just like everybody else. And sometimes he's right up against the wall for hired help. But since he has a Perfection, his daughter can always help him out. "The Perfection Milker was rightly named," he says, "for it is a perfect milker and so easy to operate that my daughter, 17 years old, has milked my whole herd of 27 Holstein cows every night during the summer when we were short of help."

The Perfection Gets More Milk

"The Perfection gets more milk than any hand milker can get from my cows. One of my cows, 5 years old, gave as high as 102 pounds of milk in a day. A heifer gave 64 pounds in a day. One of my cows, which had been milked nearly two years without freshening we could not dry up without taking the machine off her."

Just Ask Your Neighbors

"We have several other kinds of milking machines in this neighborhood but everyone seems to think the Perfection gives the best results and is the most reliable machine."

Names, Addresses and Catalog Waiting For You

How much would it be worth to you to have your milking problem solved? Find out about the Perfection Milker. We'll gladly send you names and addresses of owners so you can investigate for yourself. Just ask the men who own Perfections what they think of them. We will also send without charge a copy of "What the Dairyman Wants to Know", the book that answers every question about milking machines. Write.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Boys and Girls to Judge Cattle at National Dairy Show

The boys and girls who are selected to compete October 8th, in the National Junior Judging Contest for dairy cattle, at the National Dairy Show, Chicago, will come back with something worth while. The National Dairy Association, under whose auspices this contest is held, plans to make this the largest and most instructive junior judging contest ever held. It is expected that 30 teams, from as many states, will be at the judging arena when the contest begins, according to representatives of the Dairy Division, Bureau of Animal Industry, and the Boys' and Girls' Club section of the States Relations Service, U. S. Department of Agriculture, who are co-operating with the National Dairy Association in putting on the contest.

Thirty-nine gold, silver, and bronze medals and a gold watch, offered by the National Dairy Association, will be awarded to the winners; and in addition to this, the first fifteen teams entered will be housed and fed in Chicago, at the expense of the National Dairy Association. Some of the dairy cattle breeders' associations also have signified an intention of awarding prizes to those doing the best work in judging the cattle of their respective breeds.

All Club Members Eligible

Only one team can be entered in the contest from any one state. Any boy or girl between the ages of 12 and 18, who is a bona fide member of a club project, and who has not had more than six weeks' training in any agricultural college or short course at such an institution, is eligible for a team. Eligibility, however, must be certified by the director of extension of the state land-grant college.

Plan Many Extra Features

Besides the excellent training in judging dairy cattle which will be obtained at a contest of this kind, the team members will enjoy a number of other advantages. Some of the leading breeders of dairy cattle will talk to the boys and girls and give them the benefit of their experiences in dairy cattle breeding. Tours of the city of Chicago are also planned for the judging teams, and the contestants will have an opportunity of seeing the places of interest and meeting the prominent people of the city and state.

Last year the judging contest was tried out on a small scale, six states being represented; and the success of this initial attempt prompted the plans for a larger contest this year. Practically all the states in the Middle West have agreed to send teams to the contest, and some of the eastern and western states have signified their intention of competing.

What the Contest Can Accomplish

The benefit from such an event is bound to be far-reaching. Thousands of boys and girls who competed in the local contest, then in the county contest, and finally in the state contest for state team championship, have obtained a fine training in cattle judging. Competition always arouses interest in a subject, and these contests have proven very effective as a means of teaching dairy cattle judging, and in developing a wholesome point of contact between boys and girls and the cow—that efficient producer of human food. There is a very urgent demand for good cattle judges in America.

Entries for teams that are to compete in this contest must be sent in by August 1, to W. E. Skinner, General Manager, National Dairy Show, Suite 222, 910 South Michigan Ave., Chicago; and the names of the individuals who will compose the teams must be sent in by September 27. Details as to the classes of animals to be judged, the manner of judging, etc., will be announced later.—National Dairy Show Association.

BOTH GETTING THE RIGHT START—KENNETH DENNEY AND HIS PURE-BRED CALF

Scythe Song

Mowers, weary, and brown, and blithe,
What is the world methinks ye know,
Endless over-word that the scythe
Sings to the blades of the grass below?
Scythes that swing in the grass and clover,
Something, still, they say as they pass;
What is the word that, over and over,
Sings the scythe to the flowers and grass?

Hush, ah hush, the scythes are saying,
Hush, and heed not, and fall asleep;
Hush, they say to the grasses swaying,
Hush, they sing to the clover deep!
Hush—'tis the lullaby time is singing—
Hush, and heed not, for all things pass,
Hush, ah hush! and the scythes are swinging
Over the clover, over the grass!

ANDREW LANG.

What a Junior Has to Say About a Silo

A Second Prize Essay

I think that a silo is a good investment for all farmers—large or small—because silage solves the problem of producing more feed for the stock of the farm. The greatest expense connected with live stock business is the cost of feeding, and the silo will lower the cost.

Silage can be made from almost any green forage crop. Corn, soy beans, clover, alfalfa, and millets may be used for this purpose. Silage preserves the entire plant, retaining all of the juices and flavor of the growing plant. Silage properly made is a money maker and a labor saver.

The green, succulent ensilage is appetizing and easily digested and keeps the cattle in a much better condition through the long winter months and adds materially to the milk flow at this time of the year. Ensilage fed cattle keep in a thrifty condition and have glossy, sleek coats of hair. A full silo will enable a farmer to keep more stock.

Silage will save the buying of special feeds to a large extent. It is quite an all around feed in itself. It should be fed night and morning after milking. A good ration is about 30 pounds of corn ensilage, clover hay, and a pound of grain for each three pounds of milk daily produced.

A silo is the cheapest place to store rough feed as less room is required for storage of the product than when cured and mowed away in the barn. A ton of hay in a barn will occupy at least 400 cu. ft., while a ton of ensilage stored in a silo will occupy about 50 cu. ft.

A silo will increase the value of the farm. It usually pays for itself in one year's time, and it is a big profit producer each year after that. In times of drouth, long wet seasons, or early frost, the crops that have been grown can be saved if one has a silo. Every argument is in favor of a silo because ensilage feeding means profitable feeding.

Wisconsin. EDWARD NELSON.

Cold-Pack Canning in Rhyme

The people try to conserve food,
They improve more each day,
And now I am going to tell to you
A new and easier way.
By doing it this way
You're helping Hoover's plan,
And also by conserving food
You're helping Uncle Sam.

First put your jars into a pan,
This is to sterilize,
While these are getting ready
Fix your fruit if you are wise,
And after you have graded it,
Picked out the ripe and green
Place it in a colander
And wash it till it's clean.

Then put it in a cheese cloth bag,
Place this in boiling water;
Now leave it here to sterilize
One minute and a quarter,
Then quickly place in very cold
And dip it up and down,
And after you have finished you have
The finest fruit in town.

Of course you've made your syrup,
The gas is turned up far.
So quickly peel your peaches,
And place them in a jar.
Then place it in the canner,
Leave for one-third of an hour,
It's prepared and cooked so carefully
There's small danger of flat sour.

So now remove it carefully
And place it on the shelf,
Then leave it till next morning
And test it for yourself.
Now this latest, newest method
Is as easy as can be;
But if you doubt my word one bit
Try it for yourself and see.

We're the Washoe County Canning Team
In members we are three.
We demonstrate Cold-Pack Canning
To all, admission free.
Although we're just beginners
On winning, our plans are laid.
With the aid of our instructors,
Don't you think we've progress made?

Nevada. Florence L. Brown.

Why Every Farmer Should Have a Silo

Third Prize Essay

Dairying is one of the greatest industries. This branch is carried on mostly during the summer months when the cows have the chance of living on the fresh green pastures. Then they milk their best. As soon as the summer months are over, then cows do not produce as much milk because they usually do not get the kind of feed that will make the most milk. But by the use of the silo this

THREE ENTHUSIASTIC HOARD'S DAIRYMAN JUNIORS

can be partly overcome. Good fresh silage fed with good clover or alfalfa hay has proven to be an excellent ration for the winter months.

The income of the farmer living in the north during the winter months has mostly come from the logging industry, but since this is growing constantly less, a new industry should be the resort. Dairying should be this resort, and don't forget that the silo is the best co-partner for one in this business. As a rule, prices of the dairy products are higher in the winter than they are in the summer, so let the silo give your stock feed that will make them produce more. Here are eight good reasons why every farmer should have a silo.

1. The silo gives 25% to 30% more feeding value to the corn crop than when it is fed as dry fodder.

2. The silo provides a succulent feed in winter and helps to keep the cows healthy and in a good working condition.

3. The silo gives an insurance against short, drouth stricken pastures.

4. The silo makes the farmer make the best use of a frost stricken corn crop. Even immature corn can be put into the silo to good advantage.

5. Silage is a good feed for fattening stock for the market.

6. The silo furnishes the cheapest form of feed for the winter months.

7. The silo should be a partner of every cheese factory patron.

8. The silo enables the farmer to feed his stock from less acres, thereby leaving more crops to be marketed and in the end benefiting himself and his country.

Wisconsin SYLVIA NELSON.

Lime the Land

Music—"Over There"

Farmer get your lime, get your lime, get your lime,
Put it on in time, on in time, on in time;
Try it on your land today,
Then we'll hear what you will say.
Hurry right away, no delay, go today.
Make your family glad to have had such a dad,
Tell your dear wife not to pine,
For you see a dollar sign.

Chorus

On the land, on the land,
Spread the lime, spread the lime, on the land,
For your crops all need it, your crops all need it,
The crops all need it ev'rywhere.
So prepare, so prepare,
Spread the lime, spread the lime, ev'rywhere,
For they need it, they need it badly,
And they won't yield well till we get lime on the land.

Hens Making Good

HOARD'S DAIRYMAN JUNIORS:—I have just made such a fine record with

When the Cow Kicks over an open pail the milk is spilled and lost. This cannot happen if you use a Non-Spill Sanitary Dairy Pail. This new pail is spill-proof. An automatic valve is your protection against spills. This simple device saves milk and money for you.

The Pail Pays for Itself several times over during the summer season when the flies and heat cause the cow to kick. It is a protection against costly milk waste by spills.

The Non-Spill Pail is absolutely sanitary. It is made of heavy charcoal tin plate. Its seams are smoothly soldered, leaving no crevices where germs can lodge. Its capacity is 3 gallons. A closely woven brass sieve, protected by a non-splash rim, strains the milk and keeps dirt and foreign substances out of the pail.

Your local dealer sells it or will get it for you. It's a Schlueter metal product.

Dealers: Write for our special proposition. Your customers will want Non-Spill Sanitary Dairy Pails.

H. A. Meyer, Syracuse, N. Y.

When writing advertisers please mention Hoard's Dairyman.

my flock of hens that I thought you would all like to hear about it. I started to raise poultry one year and a half ago. During this time I have spent $150 on them and, not having the money, I went in debt. I wanted to give them a good start. Today I have paid off all of the debt and have left $10 with which to start my bank account.

The following is the egg record they have made. They started laying in October. Now don't you think that this is a good record for 12 Single Comb White Leghorns to make?

Month	No. of eggs	Month	No. of eggs
October	59	March	269
November	77	April	295
December	88	May	300
January	132		
February	170	Total	1390

During the months of April and May I got 595 eggs, an average of about 10 a day, from the twelve of them. I consider this a very good record considering that some of them must have laid every day for two months. During the month of April, I broke the state record and in May I broke my own record. I am claiming United States record for egg production from an ordinary flock. My hens do not come from stock that has high record egg production, or from flocks that have been trap nested for higher egg production.

My baby chicks are coming along fine. The males began crowing when they were five weeks old. I am glad that the debt is paid off so that I can now begin to bank some of the money I am making.

Wisconsin. RUSSELL PARKS.

How I Made My Crop of Potatoes

HOARD'S DAIRYMAN JUNIORS:—The potato is one of the most widely cultivated of the agricultural plants and is becoming very important as an article of human food in this country. It ranks sixth in agricultural importance in the United States.

I enrolled as a member of the Potato Club for the purpose of learning the cheapest way of raising potatoes and also earning some money of my own. The purpose of the club is to teach us boys how to raise potatoes. It also teaches us to be businesslike as we have to keep an account of expenses and profits.

The kind of soil on my potato crop is a sandy loam. First I plowed my plot of ground, it being a hay meadow before. Then I disked the ground and later on plowed it again, and finally harrowed the ground, and then I was ready for planting.

The kind of seed used was Green Mountain selected from last year's crop. The Green Mountain potato is medium in length with an oblong form and the skin is white and eyes shallow.

I cut my seed potato in pieces from one to three eyes on each piece. I planted my potatoes in rows twenty inches between each hill and three feet between each row. About two weeks later I harrowed the potatoes until they came up and then I was ready to cultivate. I cultivated my crop about four times during the season in order to do away with all weeds.

I had no trouble with diseases on my crop of potatoes but was troubled with insects for which I used Paris Green.

About October 3, I began to harvest my crop of potatoes. I dug them with a potato digger and received one hundred and twenty-three bushels of potatoes on one-fourth acre of land. I sold forty bushels and stored the rest away.

The expenses on my potato crop this year was nine dollars and forty-five cents. The value of the potato crop was one hundred and eighteen dollars and eighty-five cents, leaving a profit of one hundred and nine dollars and forty cents.

Although the potato is used as a human food it has several other uses. Starch, potato flour, glucose, and syrup are made from potato. This club work has been of great interest to me as I have learned quite a few new things about the growing of potatoes.

Michigan. WALLACE KRIEGER.

Junior Letters

Hoard's Dairyman Juniors:—My father and I live on a farm of 220 acres. We are alone on the farm this year, as we haven't a man to help us as yet, but we have rented some land to a man who is going to raise onions and radishes and some of our neighbors are going to raise tobacco on shares with us.

We have 37 head of cattle 15 milk cows, 5 yearling heifers, 8 heifers that might be in some time pretty soon, 8 calves, and a bull. Some of these are pure-breds and some are not.

We have a milking machine and a separator, both machines of which we think are the best ever. It used to take us about two hours when we had a hired man. Now we have no man and still we get done in about an hour or less.

We have five work horses and a pony. The horses' names are John, Kate, Prince, Jim, and Tom; the pony's name is Dandy and he belongs to me and my other two brothers. I use him the most, because I have to go and get the cows at night from the pasture and take them down to the pasture again in the morning.

We have about 75 hens and get about 35 eggs a day. We have about 75 young chicks now. Some we hatched in an incubator and some we had under an old hen.

We have all the grain planted.

I am 13 years old and in the seventh grade. My teacher's name is Miss Ruby Linde. My class wrote for diplomas just to see what we could do. I passed in all but spelling. The superintendent said that we had the banner class of Jefferson County.

I have a dog and his name is Spot. He is brown and white and has a while collar with a brown spot on it so we call him Spot. He always goes with me whenever I go on the pony or if I take the rifle.

My brother and I trapped last season and made over $50.

The name of our farm is Koshkonong Creek Farm.

Well, I must close, wishing the juniors good luck.

Wisconsin. Vernon O. Loga.

Hoard's Dairyman Juniors:—I received your letter and I shall answer it to the best of my ability. Yes, I work away from home during vacation. I have secured the same place I had last summer, a place about 6 miles from home. I operated a milker last summer. I sure did like it. The work was pleasant and as I like to be around cattle I enjoyed it. This summer I will do more orchard work, not because I'm tired of cows, but for the reason the man had to kill them. He killed about 27 head. They had tuberculosis. Some he valued at $750 a head.

My wages are $45 a month and board and washing. I think that very good for me as I am only 15 years old. I weigh about 120 lbs. I expect that after I am older I will go some place where I can learn more about the business. To make a success with dairy cows a person has to have some knowledge of what he is doing. Some people treat a cow as though she were a wild beast. To make a cow produce you have got to feed and take care of her to the best of your ability and if your ability isn't any good, why, what is the use of starting? To make a success a person has to have his mind on his work no matter what he is doing.

Washington. Keith E. Brooks.

Hoard's Dairyman Juniors:—I have all sorts of animals: An old sheep and a pair of twin lambs which are almost pure-bred Oxfords, a little pig that grunts half the time, and some rabbits. I have three white ones; they are about three weeks old, a bunch of little ones and there are six little gray ones and one white one. I also have three old ones, a Flemish doe and a pair of half wild ones. We are not having good weather here now. It is either raining or cloudy all the time.

Ontario, Can. Gerald Mains.

Hoard's Dairyman Juniors:—I read the paper every time it comes and found out that the juniors' page is the best. You asked me how I feed my rabbits and what I am planning to do with them. I feed them grass, oats, and corn twice a day. I give them fresh water and rutabagas or carrots every day. I have pure-bred Belgian hares which I got from E. C. Pebbles. I paid five dollars a pair. I am going to wait till I have a bunch of them and then I am going to sell them. But the worst of it is the price I ask for them is too much, although I ask just what I paid for them. I would like to have some of the juniors write to me. My address is Coleman, Wis., R. R. 2.

Wisconsin. Joseph G. Kralovetz.

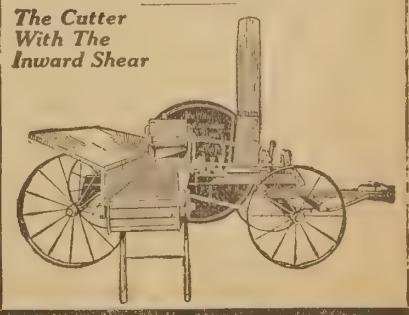
The Wonderful Attractions of British Columbia

Few countries possess all the conditions for happy, prosperous living as does British Columbia. The varieties of climate and soil offer inducements for almost every branch of agriculture. Whether in the warm interior valleys, the rich grazing table lands or the fruitful lowlands of the coast or Vancouver Island, the advantages offered for

Dairying, Fruit Growing and Stock Raising

are such as must appeal to those who wish to improve their circumstances and at the same time live in a country of delightful climate, magnificent scenery, varied resources, progressive people and abundance of opportunity for development. British Columbia—the playground of America—is already famous for the production of its orchards, fields and dairies. Now is the time to



Learn about this wonderful Province and share in its possibilities. Its industrial life—mining, lumbering, fishing, manufacturing, transportation—assures a ready market at good prices for all the farmer can produce. Schools, churches, railways, roads, telephones, all the conveniences of an old land await you in this new Province of Opportunity and Success.

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

Have You A Little Spare Time?

Have you a car—or a horse and buggy?

HOARD'S DAIRYMAN would like to offer you a proposition to look after our subscription interests in your community during your spare time.

It would be light, pleasant work among your old neighbors; and we can make it really profitable, too.

Write and tell us about the territory around you and how much you could take care of, and we'll make you a proposition.

Hoard's Dairyman, Fort Atkinson, Wis.

(This announcement is made with the approval of the Bureau of Animal Industry, United States Department of Agriculture)

Better Sires-Better Stock

$1,000 Money Prize

UNDER rules and conditions provided by the Bureau of Animal Industry, United States Department of Agriculture, a money prize of one thousand dollars will be paid by Chapin & Company, Chicago, to that county in the United States which first becomes free from inferior sires.

By inferior sires are meant low quality purebred sires as well as all crossbred, grade and scrub sires. The word "sires" includes stallions, bulls, jacks, rams, boars and bucks. Poultry is not included.

A county eligible to receive the prize must have a total of 500 or more sires of all classes and 5,000 or more head of female breeding stock.

All owners of males kept for breeding purposes, in the classes mentioned, and a majority of other livestock owners in the county, must have declared their intention of hereafter using nothing but purebred sires by joining the "Better Sires—Better Stock" campaign of the Bureau of Animal Industry.

Upon notification by a County Agent or the officer of a county livestock organization, that the county he represents is free from inferior sires, the Bureau of Animal Industry will investigate the claim. If the Federal expert finds that the county is, in fact, free from inferior sires, the Chief of the Bureau of Animal Industry will declare that county as winner of the prize.

The prize money will be deposited in a local bank to the credit of the County Agent, official of the county livestock organization or other person or persons considered best qualified to administer the fund. It will be maintained as a revolving fund from which loans may be made to persons desiring to purchase purebred sires in any of the classes mentioned. After three years from date of the award, the fund, with accumulated interest, will be distributed in five equal prizes, in open competition, for the most meritorious young stock resulting from the use of purebred sires. One prize for horses, beef cattle, dairy cattle, sheep and swine.

County agents or officials of county livestock organizations desiring to enter their counties as competitors for this prize, will indicate their intention of so doing by letter to Chapin & Company, sending a duplicate of the letter to the Chief of Bureau of Animal Industry, United States Department of Agriculture, Washington, D. C.

No time limit is placed on the offer of this prize. No other rules govern the competition except those herewith provided by the Bureau of Animal Industry.

In addition to the money prize, the county that is declared winner will be presented with a silk banner and a certificate signed by Secretary of Agriculture E. T. Meredith and Dr. John R. Mohler, Chief of Bureau of Animal Industry.

CHAPIN & COMPANY

327 S. La Salle Street Chicago, Illinois

Facts From Ohio's Fertility School

(Continued from page 5)

equally on corn, wheat, and oats; another one-half on corn and one-half on wheat; and another, in which the fertilizer is applied, to wheat. The outcome has been that the net gain per acre per rotation is highest when the fertilizer has been applied to the wheat, the gain being $60.22, and the increase in crops being 17 bushels for wheat, 3.8 for oats, and 13 bushels for corn. The values used were: corn, $1.60; oats, 75 cents; wheat, $2.50; and clover, $25 per ton.

In discussing these results, however, Professor C. G. Williams, associate director of the station, points out that these experiments have been carried on only 5 years and that so far as experimental men are concerned, it would be best to consider the application of one-half of the fertilizers, to be used in a rotation on corn and the other half on wheat. So far the total value of increase, or the net gain per acre, per rotation, has not been as high as when the fertilizer (1,000 lbs.) is applied all at one time on the wheat. This, of course, from the farm management standpoint is better, since the labor is distributed over a greater period of time. Some argue that it would be possible to put all fertilizers on one crop, thus saving some labor, but it would require a larger investment per acre at one time in that it would require a larger investment in fertilizers per acre when the wheat is sown.

Clark County, Wisconsin, Guernsey Breeders' Picnic

The Clark County, Wisconsin, Guernsey breeders were fortunate in having a bright, sunshiny day June 23 for their annual summer meeting and picnic at the farm of F. E. Winn, with nearly three hundred in attendance.

L. E. Scott told of tests being put on where all dairy breeds were represented and of the Guernsey's ability to produce butterfat more cheaply than other breeds. He urged better co-operation among the breeders and told of what the Chippewa County associations had done the past year to get more Guernseys into the county. He also especially urged the Clark County breeders to organize boys' calf clubs so as to help the boys get pure-bred calves.

The talk was followed by the business meeting and the following officers were elected: President, R. C. Powers; vice-president, George Emfeld; and secretary-treasurer, J. P. Shuering.

Thirty-five new members were added to the association. The association went on record as instructing their secretary to ask the county board to hire a live county agent and one who is interested in live stock.

There were several requests from different members that the next picnic be held in various parts of the county, but it was finally left to the board of directors to select the place.

E. A. POWERS.

Imperfect Bull

We have a fine Holstein bull 8 mos. old which has only one testicle down in place. The other is just outside the body and seems well developed. Will this bull be likely to be a calf getter?

Pennsylvania. C. J. F.

Such a bull is termed a "high flanker" and will be likely to prove sure as a breeder. Where one testicle is in the scrotum and fully developed the animal is fertile and the testicle which has not come down but is well developed also may perform its normal function. It is considered somewhat unwise, however, to breed from such a bull as the tendency to a like condition may prove hereditary, but there is no certainty about that.

Kills Flies

Kill flies and prevent disease. Put one teaspoonful of Black Flag in sheet of folded letter paper; blow it (with breath) into air of rooms. Will kill almost every fly in ten minutes. Kills insects by inhalation. Bugs don't eat it—they breathe it, and die. Destroys ants, flies, fleas, bedbugs, roaches, mosquitoes, some moths; lice on animals, birds or plants. Harmless to people and animals. Look for BLACK FLAG trademark and red-and-yellow wrapper. Drug, department, grocery and hardware stores, or direct by mail on receipt of price. *U.S.Gov't (Bulletin 771, Agri. Dept.) shows glass containers keep insect powder freshest. Buy Black Flag in Sealed Glass Bottles instead of 'insect powder' in paper bags or boxes.*

The G. L. F. Exchange in New York

(Continued from page 3)

ing them $25,000,000 roughly. Preparations are already being made by the G. L. F. Exchange to effect a big saving for this industry by handling this business. It will be able to purchase feeds under huge contracts, securing the advantage of a reduced price. This has been demonstrated. It will have the necessary capital to secure warehouses in which to store it so that it will be possible to buy on a low market and hold it. It will be able to save an immense amount in transportation by shipping in trainload lots. It will be possible to secure feeds of a higher standard.

The men who have the work of carrying on the Exchange are not theorists, they are practical men. Realizing that there was no time like the present to start a really worth-while work, they secured the services of Professor E. S. Savage of the Department of Animal Husbandry of the State College of Agrculture at Ithaca, to go out to the Middle West and investigate feed conditions. Professor Savage is known the country over as an expert on feeds and feeding. Next year farmers will have the benefit of his expert knowledge plus the capital of the G. L. F. Exchange, when they come to buy their feeds.

To complete the cycle is the Dairymen's League on the selling end. It wields the concentrated will of all the dairymen in the state in securing a fair price for their milk. An instance, a remarkable instance of its value, was shown during the last weeks of May, 1920, when it was entirely successful in securing prices for milk during June, July, August, and September that was a distinct and just triumph for the dairymen of the state. With these two factors working in close harmony it will be possible to secure a more equitable distribution of profits in the dairy industry in New York State.

In these days when cheap production of milk is absolutely necessary, the G. L. F. Exchange has another function to perform on the buying end that is of incalculable importance. The dairyman must produce as much of his food as he can on the farm. In order to do this best he must secure the finest seeds and fertilizers that money can buy. And if he goes into the retail market, as he is forced to do at present, much money can do wonders in purchasing some very poor seeds. Many can vouch for that in the case of the A. A. Berry Seed Company. It is the purpose of the Exchange to buy guaranteed seeds in bulk and sell them to New York State farmers. It will mean protection against unscrupulous seed companies, seed of high test, and a lower price than can be obtained elsewhere for seeds of the same quality.

Fertilizer is another item. Fertilizer speculators have played hob with the farmer heretofore. This year shipping conditions have made conditions still worse. When the G. L. F. Exchange gets into its full stride, it will be possible to eliminate much of this handicap. It will do the same in the fertilizer business as it does in the seed and feed business—supply the dairymen of the state with a high grade fertilizer at a price that is better than can be obtained elsewhere.

Lots of dairymen may say, "Yes, it sounds very nice, but will it work?" That is the fine part of it. It has shown that it works already through the initial venture on the part of the State Grange. The New York Grange Exchange has prospered remarkably when the conditions and handicaps under which it strove are considered. It pointed the way, found out many mistakes that its experience will render unnecessary for the G. L. F. Exchange, and, best of all, left a solid foundaton for the new enterprise to build on.

Dairymen in New York State may well look forward with optimism to the future. As time goes on their interests will be more and more fully protected. They will be guarded in their buying and in their selling. It will only remain for them to use the best knowledge they have or can obtain to produce the highest quality of milk at the most economical rate. The co-operative feature of the Dairymen's League will protect them at all seasons of the year. If they have a surplus which dealers will not accept, they can dispose of it to the League. It is protection with a big P.

The week's campaign to float the stock of the new organization has proven that dairymen in the state of New York realize their opportunity presented through their medium. Reports show that several counties oversubscribed their quotas and that many others met them. Enthusiasm was decidedly evident. New York State dairymen have something that it will pay the dairymen of other states to watch, no matter how well satisfied they are with present conditions.

EVER WISH YOU KNEW

—HOW THE—

DAUGHTERS of YOUR BULL WILL MILK?

If you put two or three years into breeding and developing a lot of heifers you want to be very sure indeed that these heifers, after all the time and money you have spent on them, will be profitable producers. You can only be certain of this through the proper selection of your herd sire; and the only dependable way to judge of this quality in your bull is by the official records back of him.

RAVINIA AYRSHIRES

have the world's greatest number of A. R. records and world's records. A Ravinia Ayrshire bull will bring you dependable production together with strength, vitality, and type.

Write us today for our profit suggestions in Ayrshires and for "Why I Chose the Ayrshire".

Economy in Production ← GUERNSEYS → Quality of Products

Indications that the Guernsey is recognized as the practical farm breed are thoroughly demonstrated by the great demand for Guernsey bulls in the leading dairy states. Wisconsin, the state leading in butter production, purchased more than 30 per cent of all Guernsey bulls sold in one year preceding May 1, 1920. Send for our free booklet, "Story of the Guernsey."

THE AMERICAN GUERNSEY CATTLE CLUB, BOX H 65, PETERBORO, N. H.

The Second Southeastern Guernsey Breeders' Sale

to be Held at Salisbury, N. C., Aug. 12th, 1920

In Co-operation with Rowan County Guernsey Breeders' Ass'n

This offering will consist of thirty-five selected Guernseys, and will come from four different states and about twelve different herds. These animals were selected by a Committee and are pronounced the best bunch of Guernseys ever offered at public auction in the South. They are from herds all under Federal inspection and every animal is guaranteed a breeder. There will be five bulls, whose dams average over 600 lbs. of fat each, and thirty females from six months to four years of age. Among them are daughters of some of the best bulls of the breed and granddaughters of the sensational Guernsey bulls. Two granddaughters of King of Chilmark, one of them bred to a son of Chilmark; eight granddaughters of Itchen Daisy's May King of Langwater, a granddaughter of Dolly Dimple's May King of Langwater, granddaughters of Ne Plus Ultra, granddaughters of Border Raider, and some of the very choicest Guernseys from the best herds in the Southern States. Three splendid heifers bred to a son of King of Chilmark, who is full brother to Lady Du Chene.

We feel that all Guernsey breeders will be interested in the kind of animals that will be offered in this sale and would suggest that you write early for catalog to

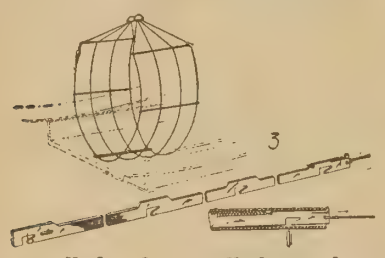
Also young Bulls from 2 to 15 months old from cows with and without records. Prices from $100.00 up.

Grover Kull, Mariondale Farm, - Genoa Jct., Wisconsin

Inventions and Appliances of Interest to Agriculture

Folding Crate

When it is desired to fold this crate the locking bar is removed, the ends and partition are folded in, the sides and half covers are in turn folded in on these, and the knocked down crate

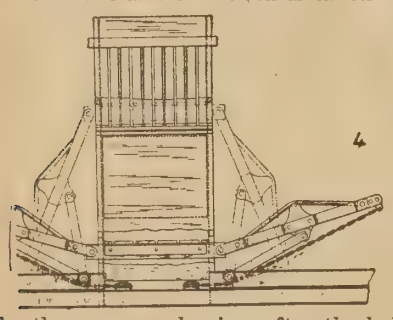


is secured by means of two spring pressed bolts extending through the bottom.

(Howard Harsh, Osakis, Minn. U. S. Patent 1,325,323).

Sling

The new feature here is the locking bar shown enlarged at the bottom of the figure. It fits into the tubular rod at the bottom of the sling, and

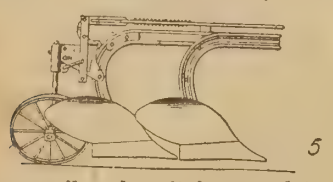


when pulled, releases all the cords on one side and dumps the load.

(C. W. Liberty, Minot, N. D. U. S. Patent 1,325,025).

Hay Press

This press does not need springs and air buffers to take up the shock of the falling follower plate. The hay is compressed by a toggle lever mechanism and the shock is taken up



by the same mechanism after the bale is tied.

(Junior Monarch Hay Press Co., San Leondro, Cal. U. S. Patent 1,325,306).

Plow

This invention refers to the rear support of the plow frame and more particularly to the locking mechanism which holds it in elevated position. This is a curved latch which locks automatically when the actuating rod is moved forward; and re-

leases easily when it is moved to the rear.

(Sears, Roebuck and Co., Chicago, Ill. U. S. Patent 1,324,101).

Canada. C. J. LYNDE.

Sings a nameless poet: The old hen sat in a leafless tree and said, "Nobody cares for me. My food is what I find about, I hunt for it till I'm frazzled out. My owner says I do not pay, and that I ought to sing and lay. I wish he had to sit out here and live on pickin's all the year. I'll bet a half a cent, by jing, he wouldn't lay from now till spring."

GUERNSEYS

In the July 2d Issue

of the Hoard's Dairyman, page 1446 is an account of the Anna Dean Sale. If you read this you will notice that twenty-five daughters of Imp. Goldseeker of Anna Dean Farm sold at an average of $500. I am offering for sale three bulls by same sire as these heifers. One of them out of a daughter of Masher's Sequel with a record of 635 lbs. of fat. On the inside cover of the Guernsey Breeders' Journal, the last issue, you will find a picture of this cow's sister. I am also offering for sale a daughter of Imp. Clipper that sold for $1,950.00 at this sale.

W. W. CLARK, - Vesper, Wisconsin

Waldwic Guernseys FOR SALE

YEARLY RECORD BLOOD

Bull calf born Dec. 11, 1919. Sire, Maplecrest Avalon, whose four nearest dams average 1,067 lbs. butter for the year, three of them being 1,200-lb. cows. Dam by a son of Dutchland Creamelle Korndyke Lad, with seven dams in her pedigree over 1,000 lbs. butter in a year. She is now on yearly test as senior two-year-old and is making a good record. Calf 90 per cent white, a very handsome individual. He has twelve dams in his six-generation pedigree that will average 1,035 lbs. butter in a year. Price for prompt sale, $250. The combination of yearly record blood would be hard to equal in the country.

AVALON FARMS, E. D. Curtis, owner, Bantam, Conn.

Buffalo Creek Farm Holsteins

We have for sale a bull calf born Dec. 11, 1919, evenly marked in color, from a 25-lb. cow that also has a good 10-month record. He is sired by a grandson of Sir Pietertje Ormsby Mercedes. Write for price and pedigree.

ready for light service, sired by a 33-lb. bull and out of tested dams. We will answer your inquiry promptly. **S. A. BAIRD & SON, WAUKESHA, WIS.**

Head Your Herd With a Bull!

Get a son of King Superba out of one of our good cows. King Superba's offspring won first and second in get-of-sire and calf herd at the Wisconsin State Fair, 1918. His four daughters sold in the Waukesha Sale, Nov. 1919, averaged $959. King Superba's dam was the first cow to be strictly officially tested for the entire year. She produced 1231 lbs. butter, 26,433 lbs. milk as a four-year-old. She has twice produced over 33 lbs. butter in 7 days. If you wish to combine individuality and production, head your herd with a Son of King Superba. We now offer a number of his choice sons, serviceable age and younger, out of dams with records up to 24 lbs. Several of the dams are on yearly test. Don't wait. Come and see them now. **BAIRD BROTHERS, WAUKESHA, WISCONSIN.**

One of the sons of King Superba. They are all excellent individuals.

Yearly Records

Choice Young Bulls

FOR SALE!

Segis Pontiac Black Hawk

BORN FEBRUARY 7, 1918

A son of a 29-lb. sire and from a 24-lb. cow. A grandson of the "marvel of all sires", KING SEGIS PONTIAC COUNT. The daughters of the latter hold more World's records, (6) in the regular divisions than those of any other two sires. He already has (6) daughters with year butter records above 1,000 lbs. and is the only sire to have all daughters with year milk records above 20,000 lbs. Write us for pedigree and price.

Lake Meadow Farm, - Wayzata, Minn.

CLOVERCREST HOLSTEINS

Herd Bull for Sale

A 35.51-lb. grandson of King Korndyke Sadie Vale, born Jan. 1917. Six nearest dams average 116 lbs. butter in thirty days and over 30 lbs. in seven days. He is a son of K. K. S. V. 24th and Beauty Rauwerd Hengerveld 2d, whose sire is Prince Segis Korndyke. He is a sure breeder, seven-eighths white. Write for photo and pedigree.

CLOVERCREST FARM, Amboy, Minn.

Mankato Holstein Farms

are combining the best of Ormsby breeding through the sons of these great proven long distance sires: Sir Pietertje Ormsby Mercedes, Ormsby Korndyke Lad, King Korndyke Colantha Ormsby. These great sires have 22 daughters over 1,000 lbs. and 35 over 30 lbs.

A Federal Accredited Herd.

Marlow & Randall, - Mankato, Minn.

BULLS—Two of Them.

Ready for service. One light and one medium in color. One sired by our DUTCHLAND CREAMELLE COLANTHA LAD, from a good daughter of SIR WINANA BEETS SEGIS. The other sired by SIR WINANA BEETS SEGIS from a daughter of SEGIS JOHANNA GRAHAMHOLM. Both cows are on yearly test now and are making good records. Don't buy a bull until you have seen and studied the pedigrees, pictures and prices on these youngsters. They are good ones. **GRAHAMHOLM FARMS,**

Facts in BLACK & WHITE

Holstein Registrations and Transfers Indicate Great Prosperity

The total number of pure-bred Holstein Friesian cattle imported from Holland was 7,752, and from these have sprung all the pure-bred Holsteins in the United States and Canada, as well as the numbers exported to Australia, South Africa, New Zealand, Mexico, and elsewhere. The Herd-Book of The Holstein Friesian Association shows a total of 783,427 registrations and that of Canada 100,725. The transfer record indicates a state of demand, and it is of interest to know that in 1918, 94,465 transfers were recorded.

Europe will look to America to replace her breeding stock depleted by the war, and values of American Holsteins will make substantial advances.

Know the Holstein facts from our various booklets. Send for them today and become a Holstein breeder or owner.

The Holstein-Friesian Association
101 Hudson Street, Brattleboro, Vermont.

SIR JOHANNA FAYNE

Sir Johanna Fayne 42147

has 31 daughters with long-time records. 10 daughters four years and older average 663 pounds fat from 21,441 pounds milk in 365 days. 7 three-year-olds average 455 pounds fat from 13,732 pounds milk in 305 days at an average age of 3 years, 4 months, 12 days. 14 two-year-olds average 388 pounds fat from 12,716 pounds milk in 305 days at an average age of 2 years, 3 months, 23 days.

Opinions about Tires should be *Weighed* as well as Counted

The tire on the left illustrates the cause of about 75 per cent of all tire trouble—insufficient inflation.

The pressure recommended by the manufacturer of your tire is the best to follow—and it cannot be estimated by kicking the tire or punching it. The regular use of a reliable air gauge is the best safeguard against punctures, rim cutting and fabric breakdown.

THERE is hardly a motorist who hasn't at some time or other in his experience had a tire dealer attempt to sell him a tire by representing it as the fastest seller in town.

More attempts are probably made to sell tires by playing to the motorist's alleged weakness for "crowd of buyers" than by any other known method of selling.

* * *

The *experienced* motorist, of course, refuses to surrender his individual judgment to any crowd or mass of whatever size.

Too often he has seen the results of accepting opinions at their face value, without first finding out *what they are based on.*

And you will find him going more and more to the dealer who has something to offer in support of his tires other than "crowds of buyers" and "numbers of sales."

* * *

The opinion in favor of U. S. Tires is not based solely on the number of them in use.

Great as that number is, it is due to something besides clever arguments.

Thousands of motorists today are putting up with second choice tires because forced production is *inconsistent with U. S. standard of quality.*

The United States Rubber Company's enormous investment—greater than that of any concern in the industry—has always been aimed *solely* at quality.

Building a *tire* first and a market afterwards. Thinking of the *individual user* instead of the number of sales.

One of the reasons, perhaps, why there is now a scarcity of U. S. Tires.

* * *

If the time ever comes when U. S. Tires can be supplied to all, or nearly all, of the people who want them, they will still have *more to recommend them* than merely the largest following.

Safe Water for the Dairy

ORIN CROOKER, ILLINOIS

WATER that is not entirely safe for drinking purposes is not safe for use in the dairy. It must be quite above suspicion. To some persons it may appear that we assume in these statements a woeful lack of intelligence on the part of dairymen. This, however, is by no means the point. The average dairyman is as well versed in such matters, no doubt, as the average individual. Possibly he is more so. On the other hand, it is a fact that there is very little real understanding on the part of people generally in regard to what constitutes a safe drinking water. In this regard dairymen are in fully as much need as others of more knowledge. Too often the basis of judgment is the taste or appearance of the water. If it is cool, clear, without odor or disagreeable taste it is usually termed good and safe to use. These factors, however, may have little or nothing to do with its purity or impurity. Furthermore, people accustomed to drink all the time from the same well are poor judges of the taste or odor of the water in question. Our purpose in this article is to state what constitutes a safe drinking water and to indicate some of the more common factors which cause water to fall below this standard of fitness.

Briefly told, water that is free from sewage or other waste products is a safe water to use so far as human health is concerned. It is worth while, in passing, to note that a water may be free from such contamination and still possess taste or odor, or both, as is the case with many of the waters from so-called mineral springs. It may be free from sewage and still be highly colored, as in the instance of certain water supplies in New England where the coloring is due to causes that are entirely harmless. On the other hand, water may bubble clear, cool, and sparkling from a spring, yet notwithstanding its attractiveness it may contain sewage or other waste products. Let us, first of all, set to one side any notion we may have that the taste, appearance, or odor is any sure index of its quality.

It is not surprising, perhaps, that many farm water supplies are not above suspicion. Every farm owner is his own health commissioner, so to speak, and in most cases he acts in this capacity without any training or experience. City water supplies are safeguarded by men especially trained for this work. Not so on the farm. The well is sunk or dug, as a rule, in the most convenient spot, often with complete disregard of its surroundings. Little heed or attention may be given to sources of possible contamination. It is common enough to find the well curbing broken or insufficient. All told, it should be looked upon as a fortunate circumstance, perhaps, that farm waters are as good as they are.

On the assumption that a safe drinking water is one that is free from sewage or other wastes let us now group together the more common sources of such contamination.

(1) Underground seepage from privy vaults, barnyards, hog pens, cesspools, and so on.

(2) Foreign material entering the well through broken or insufficient curbings. Such include the droppings from poultry and farm animals permitted access to the vicinity of the well, leachings from mud and filth left around the well by the feet of those who have visited the barnyard, hog pen, and so on. Many small creatures, such as mice, toads, moles, snakes, and even rabbits, have found their way into wells equipped with poor curbing.

(3) Slop water thrown upon the ground from the kitchen door or discharged from the kitchen sink into a broken drain may influence quite readily the water of a well that lies within easy distance.

(4) To the factors indicated above should be added this additional one, namely, that when water is piped from a spring located on the farm it is not unusual to find it influenced by the seepage from fertilized fields or by the droppings of stock permitted to run in close proximity to the point where the spring rises to the surface of the ground.

In each of these instances, save the third, it will be seen that the chief factor of contamination is human or animal excrement, which we cover by the term "sewage". The possible contamination set forth under the third heading is of an uncertain kind which may or may not carry disease producing germs. It is, however, undesirable at best, and should be classed with the others as factors to be guarded against.

Looking back at this point over the four divisions into which we have classified, roughly, the sources of contamination most easily possible in farm water supplies, we are impressed with the fact that most of them can be easily obviated. Indeed, all of them, if need be, may be eliminated in some instances without unnecessary hardship. The source of possible pollution indicated in the third division needs nothing, for instance, to remove the menace it holds save a tight tile or drain and a discontinuance of a disagreeable practice which some farm housewives follow in the manner of emptying their dishpans. Where the ground has become thoroughly impregnated from kitchen slop water the effect of it, of course, will remain for a long time.

In much the same way other factors may be minimized or overcome. A proper curbing over the top and for six feet underground around the sides of the well, will keep out foreign material indicated under the second heading. The fencing off of stock, and smaller applications of manure in the neighborhood of a spring, will do much to overcome the situation spoken of under heading four. There remain, then, as sources of possible contamination which may not be so easily rem-

(Continued on page 41)

CARVED OUT OF THE FOREST

This is not a summer resort. The houses are the homes fo the employees on a new Holstein dairy farm in Door County, Wisconsin, that is owned by Murphy Bros. The building in the foreground is for the unmarried employees, that in the center is the herdsman's cottage, and on the right is the manager's home. A small club house with recreation rooms and sleeping quarters is to be erected later.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Reducing Corn Losses

Experiments conducted by the Bureau of Plant Industry show that one of the best ways to increase profits from the corn crop is to avoid losses from such causes as frost, drouth, insects, and diseases. If dependable seed of strong germination is used, corn may be planted earlier than is commonly practiced, thus giving the crop a longer period for growth and enabling it to escape early fall frosts. Some varieties of corn are more resistant than others to frost injury in the seedling stage. It has also been shown that varieties are not all similarly affected by early and late planting.

The danger of losses from drouth may be reduced by earlier planting than is commonly practiced where the season is short, and by making successive plantings where the season is long. In the latter case the chances for the production of a partial crop are much better if early, normal, and late plantings are made than if the entire crop is planted at one time, as drouth or hot winds which injure the crop at one stage of growth may do little harm to it at younger or older stages.

Losses from corn weevils in the South may be reduced by selecting seed ears which are closely and completely covered by the shucks. Weevil losses in harvested corn may be lessened by the early feeding of ears not well protected against weevils, or by shelling corn and storing it in closely woven bags. The directions for reducing weevil waste in southern corn are contained in Farmers' Bulletin 915. Losses from disease may be reduced by the careful selection of seed corn which is free from diseases.—C. R. Ball, C. P. Hartley, and C. H. Kyle, U. S. Dept. of Agr.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

Little Mother

Little mother of the farm,
With your hair of silver grey,
Shielding us from hurt and harm,
All along the worried way.
Do we understand your worth?
Do we know your virtues all?
Sweetest little soul on earth!
One who hear's the kiddie-call.

Little mother as we grow,
Up to manhood's proud estate,
Then, and not 'til then, we know,
Why you really are great!
Burden-bearer of the place,
Smiling wizard of all toil.
Always calm and fair 'o face,
Matron of the widespread soil!

Little mother of us all,
Grown-ups and the baby ones.
Summer's days or snow-flake fall,
So your patient story runs.
Always just the same, I guess,
Mothers are that way, that breed;
Sweethearts through the joys and stress,
Friends of fair times and of need.

We believe in tractors and there is nothing quite like being modern, but for fear somebody may think that the old fashioned mule is going out of fashion, suppose we give a few facts. In Yuma, Arizona, The Southwest Cotton Company of this section has just paid $1,800 for two spans of mules. This means $450 per hind-kicker. No, these mules will not be entered in any fancy racing or ear-wagging contest—they are for straight farm haulage.

Do You Love Your Dog?

A postman tells this story, and vouches that it is absolutely true. He is on a farm route, and when he does not stop to deliver letters, the Collie barks furiously. He shows his teeth and makes an awful fuss. In other words, the dog seems to sense that if the rural free delivery man does not leave mail of some kind, he is not fulfilling his mission. But when he does leave a letter or a paper there is no bark.

From a Note Book

A 250-pound hog, owned by L. Jones, near Island Number Two, Hickman, Ky., managed to escape and swam twenty miles down the Mississippi River. The current carried the porker on its mad trip. But during this time, said hog lost ten pounds in weight. Shows what worry will do, even to a piece of pork.

What is the smallest honey bee you ever knew? On an East India Island there is a race of bees that seem to hold the record. Their combs are no larger than a child's hand. Each cell is as tiny as a pin head.

The amateur farmer had just entered the general store in the village. He seemed a bit embarrassed.

"What can I do for you?" asked the proprietor.

"If you please," was the answer, "I want to get a dozen cream separators. I'll try them, and if they work out all right, I'll be back for more next week."

A meadow is a sacred place. With cow bells jingling in it, there is a suggestion of the sort of religion that means strong babies, smiling mothers, the strength of a nation.

Hand Milking versus The De Laval Milker

Hand milking is not a natural process. Neither is it uniform nor regular.

Even the best hand milker does not milk the same every day—nor at every milking. It is a well-known fact that even the best hand milkers milk more rapidly and energetically at some times than at others, as the time of year and a man's physical condition vary his methods of milking. Matters of temperament and disposition quickly affect the cow and interfere with the secretion of milk.

The De Laval Milker, on the other hand, is regular, uniform, and positive in action at every milking. It milks the same at any hour of the day and every day in the year. This regularity and the alternating action at fixed speed, are agreeable to the cow and promote secretion and regular flow of milk.

The De Laval Milker also saves time and labor. In fact, one man with a De Laval Milker can milk three times as many cows in a given time as he can milk by hand.

The perfect sanitary features of the De Laval Milker are important. All parts that come in contact with the milk can be quickly and easily cleaned and sterilized. This is especially necessary in marketing certified milk.

Write to nearest De Laval office for Milker Catalog, mentioning number of cows milked

QUALITY BUTTER BY PARCEL POST

L. W. ENGLISH lives on a dairy farm in the hills of Vermont. He manufactures and sells butter—good butter. No advertising is carried—not even a farm sign directs the attention of the passerby to the farm's production. Yet customers in several states insist on buying their butter from Mr. English and are willing to pay well for it. Last year the parcel post took 7,000 pounds from the farm and delivered it to points as much as a thousand miles distant. Returning mails brought payment at the rate of ten to fifteen cents per pound above New York City prices in letters expressing satisfaction and placing further orders.

The quality of this butter sells it. Mr. English supplies a local tourist hotel with a product of such flavor that guests order it sent to their homes. Visitors in their homes, in turn, recognize the superiority of the butter and send in their orders. On the afternoon we visited the farm a few weeks ago, thirty-one orders from several states were listed for parcel posting the next morning. On the desk in Mr. English's office were letters from which the following extracts are taken: "Please send me two pounds of butter each week. I am a son of Mrs. ——— whom you already supply." "Will you please send me five pounds of butter in prints, the same as Mrs. ——— receives. Send this amount weekly." "I like the butter which you send my sister, Mrs. ———, very much and would like you to send some to me regularly. I would like two pounds every other week. I understand the price is 75 cents per pound." It may be said in truth of this farm, "Satisfied customers, our best advertisement."

THE CARTON USED IN PARCEL POSTING BUTTER FROM THE ENGLISH FARM

Five of these can be wrapped in paper in the five-pound card board container used. This carton means quality to the customers of this butter. Seven thousand of these went out from the farm last year.

Every possible care is taken to safeguard the healthfulness of the butter sold. The herd of grade Jerseys is well fed and healthy. The milk is separated under every practical precaution of cleanliness and the cream is stored in a sweet, cool place until ready to be prepared for churning. When there is a surplus over the parcel post orders, it readily sells at highest quotations on the best creamery butter. It was given first place in the Vermont butter scoring contest and was third at the 1919 Eastern States Exposition.

Parcel Posting a Success

The success on this farm proves the parcel post can be made to give satisfactory service in "direct from producer to consumer" shipping. Butter is sent in lots of one to twenty pounds for distances of several hundred miles and delivered in good condition. It goes regularly to Washington, D. C. A twenty-pound package arrived in Florida when the temperature was 90°F. and was still cold enough to be hard.

"The secret of successful parcel posting of butter," says Mr. English, "is heavy paper insulation." In warm weather several thicknesses of newspaper enclose the package inside of the card board container. "Don't be afraid to use plenty of wrapping," he says. "Carefully insulated shipments of butter are sure to get through all right. We have never had a complaint." The card board boxes are purchased in large quantities. A size large enough to hold five one-pound prints costs $12 per hundred; one large enough for ten pounds is purchased for $17. In the winter season only one-half of a box is used so that the expense is cut in two.

Cost of Parcel Post Mailing

Parcel post charges are not prohibitive on a high quality product, especially with shipments of five pounds or more. However, butter on which the consumer is unwilling to pay a liberal premium could not be sent at a profit. It costs Mr. English ten cents to parcel post a package containing five pounds within the first and second zones. For a ten-pound lot the charge is sixteen cents, or one and six-tenths cents per pound. On a single pound the postage is six cents but only a few orders for this quantity are filled. The charge for container and stamps will average less than three cents per pound. The total when taken from the premium of ten to fifteen cents above New York prices which is received still leaves a good net return.

The English farm is a modest place. It has no expensive equipment or pretentious buildings. Its product differs from that of thousands of other Vermont farms only because of the pride of its owner. Its butter has no competition—it outclasses it. Oleomargarine does not cut down the list of its buyers; they accept it gladly at good prices. It is a quality product—sweet, pure butter made from milk fat from healthy cows and kept clean and cool from the time the milk leaves the udder of the cow until it reaches the table. It is such a product as generates a just pride in dairying. With dairy products handled in this manner there can be no over-production. The problem with the industry would be as it is now with the English farm, that of supplying demand. This Vermont farm gives proof that if a man will manufacture butter of the highest quality, "though he build his house in a forest the world will make a beaten path to his door."

RODERICK ENGLISH AND "THE BEST TEAM ON THE FARM"

Such a yoke of Devon steers is a source of pride on many a Vermont Farm. They are strong, tractable, and are easy keepers—picking their living with the milking herd when not at work. And when their period of usefulness is over, a ready market is found for them. For Vermont conditions, at least, Solomon's words were those of wisdom: "Where no oxen are, the crib is clean; but much increase is by the strength of the ox."

ONE OF THE THIRTY-FOUR JERSEYS WHICH SUPPLYS THE FAT FOR QUALITY BUTTER, AND MR. ENGLISH WITH HIS THREE ASSISTANTS

In a contest at the Windsor County Fair last fall Roderick won a ribbon; Susie, to the right of her father, fifth place; and Edna, at the extreme right, was the proud winner of the first prize, a registered Jersey bull calf. The English family is a happy one—with pride in old Vermont and in the industry which gives its livelihood.

Promoting Pure-bred Holsteins at Fort Scott

A. C. MALONEY, KANSAS

EXCITEMENT? Yes, lots of it; a parade, a crowd, the band, motion picture camera operator clicking off a reel, and everything necessary to emphasize the event was in evidence when a hundred head of registered Holsteins were distributed by lot to twenty local farmers at Fort Scott, Kansas. This is the first plunge of the farmers of this district in breeding pure-bred Holsteins.

The cows are owned by the Bourbon County Holstein-Friesian Company, which is a stock company, capitalized at $100,000, organized to promote the community breeding of high quality registered Holstein cattle in Bourbon County. This company is placing two hundred head of registered Holstein cattle on the farms of local dairymen on shares.

The band, twenty-one milk trucks that transport milk to the local condensery, and one of the company's herd sires headed a parade in which the cows were driven through the town to the Plaza, where they were distributed.

In order to be as equitable as possible, the animals that were distributed were divided into three groups. Twenty cows which were considered the most desirable were placed in one group, twenty cows which were thought to be the least desirable were placed in another group, and the remaining cows were placed in a third group. Cards numbered to correspond with number on the cows were placed in three different receptacles and each man who received cows drew one of the twenty most desirable cows, one of the twenty poorest cows, and from the remaining group, the cows necessary to complete his allotment.

THE YARD IN WHICH THE COWS WERE HERDED FOR DISTRIBUTION

The cows were purchased in southern Michigan and eastern Ohio by a committee composed of H. M. Griffith, farmer; I. O. Trask, banker; Peter A. Erie, dairyman; and A. C. Maloney, county agent. This committee spent a month in dairy districts of Michigan and Ohio selecting these cattle. They secured animals of from two to five years of age. A few of them had calves at their sides and the rest are expected to freshen within the next couple of months. These cows cost, laid down at Fort Scott, from $275 to $650 each, the average cost being nearly $400.

The Bourbon County Holstein-Friesian Company was organized by the Fort Scott Chamber of Commerce and the Bourbon County Farm Bureau co-operating. A committee from the Bourbon County Farm Bureau, at the suggestion of the county agent, investigated this system of community breeding and was convinced of its value and advantages. The committee then secured the assistance of

EVERY KERNEL AND THE LAST STRAW

C. A. LeCLAIR, WISCONSIN

PATRIOTISM during the past war inspired many farmers to get a crop of grain outside as well as inside their fence lines. If this custom is practical only as an emergency method of producing food, surely at this time when the demand for cereals is fully as great an effort can at least be made to glean every kernel grown within the borders of the farm. At best we are going to have short crops of wheat and rye this year. The value of these cereals will undoubtedly be unprecedentedly high for it is affected not only by local demand but that of other countries as well. Unless all indications fail, every kernel of bread-making grain grown will be highly bid for during the coming year. The value of oats and barley will naturally mount in proportion. Under these conditions who can doubt the practicability of making a supreme effort to get maximum yields of high quality grain? The state of fertility of the soil and weather conditions will determine how many bushels of grain the land will produce, but farmers themselves largely control how many of these bushels will be properly gathered.

This year utmost attention should be given to the time of cutting. The chances of getting quality grain are far better when a crop is cut before it gets too ripe. Often fields do not ripen uniformly, but in such cases any grain cut on the green side will ripen in the shock. On the other hand, if the harvest is delayed until the grain is dead ripe there is always the probability that wind, rain, and hail may cause lodging. When this occurs the binder cannot do a clean job and shattering of the grain invariably occurs.

Shocking the Bundles

Careless shocking of bundles also accounts for more loss of grain than is ordinarily realized. There are several ways of making shocks, namely, poor, good, and perfect. A squad of children can never be depended upon to do the work that experienced hands accomplish. It will pay this year as never before to shock grain in the most approved manner. Wheat, rye, and barley cure best in round shocks made of nine to twelve bundles each. The body of such shocks should be built by firmly setting the bundles with the heads drawn in or packed closely together. Shocks made in this fashion when capped with a couple of bundles placed so they will not blow off will withstand considerable wet weather without damage to the grain. On the other hand, oats cure better in long shocks placed in a north and south direction so that the sun can hit both sides about equally. If storms tip shocks over or remove the cap bundles one can make good wages by going over the fields to readjust them.

Threshing From Shock or Stack

How are you going to thresh? From the shock or from the stack? This is a question many county agricultural agents are asking their constituency at this season of the year. They are making a big drive for more stack threshing. There's a reason! No one can deny that the practice of threshing grain from the field has some advantages when the work can be done at the right time and everything goes smoothly. However, since most threshing on the average farm is done through threshing rings, there are about half of the members of each group who are obliged to leave their grain in the field overly long.

Last summer while I was with various crews in different parts of Wisconsin, it was apparent to me that in many instances fully a third of the grain was left in the field where shocks had melted down. The loss of grain was particularly marked with barley. Men who pitched the bundles from the shocks unto wagons would often leave on the field a large part of the grain, the straw of which was imbedded in the mud. In going from shock to shock the hands endeavored to rake up straggling stalks of grain, which slipped through the bundle as it dried out and became loosely bound, by taking one or two sweeps with their fork. At best they did only half a job of it. Supposing there is only a loss of one per cent of the grain in this way, it will pay to put a boy with a horse rake in the field to gather up the loose ends.

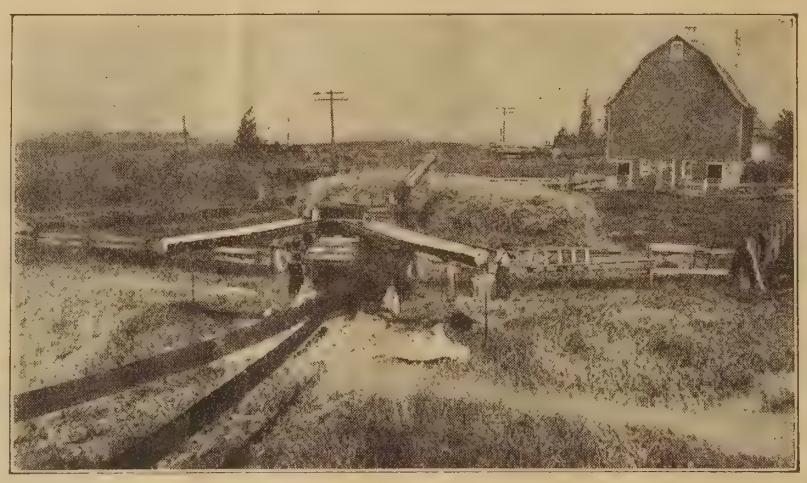
The fact that stacking is becoming more and more common in the middle west since the advent of high priced labor, should serve as pretty good evidence that farmers are finding economy in the practice over threshing from the field. As Mr. Hottman of Iowa County, Wisconsin, explained: "There are several farmers with whom it is necessary for me to swap labor. To reduce this exchange of help, I find it advantageous to stack as much grain as possible. In addition to insuring better quality it enables us to keep the machine humming when the separating begins. We can easily dispense with the help of three or four men to say nothing of twice that many teams and teamsters needed in shock threshing. The cost of feeding these extra harvest hands and their horses is considerable. If this expense can be eliminated it adds a neat little sum to the profits from each bushel of grain threshed."

Making a Stack

Stacks to be efficient should be properly built on a well drained spot of the farmyard conveniently placed for the location of the straw pile. There are men in every community and on most any farm who can build stacks which won't bulge or show green after being wetted by the first rain. In building round stacks even a beginner will make good if he insists that the bundles be always thrown to him so that they land in the middle of the stack. He should take his time in placing the bundles, at first throwing them into place with the short side of the bundle down.

When the maximum breadth of the stack is attained and drawing in of the bundles begins, they should be placed with the short side of the bundle up. This facilitates the shedding of rain when the stack is completed. To prevent bulging it is well to have the bundles pitched up from all sides of the stack if it is possible to do so. Avoiding to tread on any of the bundles in the outer three rounds of the stack also prevents danger of bulging out. Where a farmer is short of help, the simplest way to stack grain is to put it into long ricks. When this is done a man can pitch and stack at the same time. The bundles on the inside of the rick can be thrown at random and those on the outer course only need be laid with care.

I have always noticed that it is the most successful farmers who are never too busy to make repairs of granary floors, wagon boxes, and sacks in advance of threshing time. When the work begins men of this type will always be close to the machine for they know that this is the place where their supervision counts most. There is often a chance to prevent loss of grain in the operation of the machine. A little care in seeing that the bundles are fed heads first and uniformly, frequently results in the measuring of one to three bushels more grain in every hundred. Think of it! Three per cent of a year's work saved by a little extra vigilance when the threshing machine starts buzzing.



It is worth while to insist that the machine be shifted if the wind changes, for no outfit will do good work if it is obliged to blow the straw against a gale. The chaff and straw should be examined from time to time in order to determine whether the separator is doing a clean job of threshing. Often an adjustment of the concaves or a change in the speed of the machine will prevent grain from being blown into the straw pile.

The best proof that a great deal of grain goes over with the straw when special care is not taken to prevent it, is the way hens work over straw piles on the average farm. You can't fool a chicken when it comes to a square meal. Now if they got all the grain in the straw the loss would not be so great perhaps but conditions are such that the job is ordinarily too much for them. Another way to save grain is to place a canvas below the bundle carrier and beneath the sacking or weighing device of the machine where more or less slopping over of grain is likely to occur.

Stacking Straw

It is more than worth while to give special attention to the manner in which straw is stacked at threshing time. Too often the job of stacking is left to a tenderfoot upon the inducement that the work is soft under foot. It really takes a man who thoroughly knows how to handle a fork to build a well shaped and weather proof straw stack. Farmers who are in earnest to get the last straw will not hesitate to put the best man they have on the straw pile or climb up themselves. The feeding value of straw is of no mean consideration where considerable live stock is kept. It supplies one of the best forms of bedding known. Finally it has a fertilizer value twice that of farm manure. There is potential plant food in the average straw stack to make a couple of hundred bushels of grain.

As feed, bedding, or fertilizer, straw exposed to rain depreciates in value. If properly stacked the loss of vegetable matter and essential elements through the burning up process of decay can be greatly reduced. Notwithstanding, there are millions of straw stacks rotting down every year that represent value up into the billions of dollars which, if returned to the soil, would bring returns doublefold. Let's save straw and everything!

A CANVAS SPREAD BENEATH THE BUNDLE CARRIER AND SACKING DEVICE OF THE THRESHING MACHINE SAVES MANY BUSHELS OF GRAIN

STACKING GRAIN PREVENTS DAMAGE TO GRAIN AND STRAW BY WEATHER

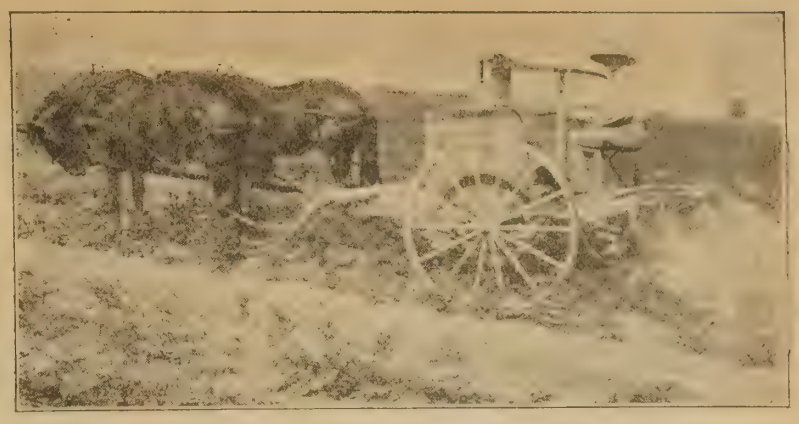
The usual way of removing silage from the silo is to use a five or six-tine fork. If the silo is not of too great diameter it is comparatively easy to pitch the silage through the door. If the silo is underground and too deep to pitch out the silage, it can be taken out by lowering the truck into the silo, filling it, and then elevating it by means of a block and tackle or by horse or gasoline engine. The litter carrier is ideal for removing silage from the pit.

Controlling Potato Blight

C. M. BAKER, OHIO

LATE blight has been the scourge of all potato diseases for the past few years, and so far as can be determined it has so infected the potato growing districts that there is no chance of completely getting rid of it. It is either in the soil or in the seed, so that spraying is the only remedy to control it.

Damp weather with the temperature around 70 degrees Fahrenheit favors the development of late blight and whenever weather of this sort is recorded, it is well to look out for an outbreak of the disease. During hot and dry weather the blight does not develop to any noticeable extent but comes on quickly when the right conditions abound.



Bordeaux mixture is a reliable spray to use in controlling potato blight and after the potatoes are about 8 inches high it is necessary to spray them every 10 days or 2 weeks thereafter. Bordeaux mixture can be made at home, but some care must be used in preparation. It is made as follows:

Dissolve 6 pounds of blue vitriol (copper-sulfate) in warm water in a wooden or earthen vessel. Slake 6 pounds of quicklime, by adding a little water slowly to start the lime to heat and then just enough to keep it from burning. Dilute both mixtures to 6 gallons each. The spray tank may then be filled with 63 gallons of water and then at the same time 6 gallons of blue vitriol solution and 6 gallons of the lime solution, stirring the mixture constantly in the tank. This will provide enough spray for an acre of potatoes.

Sometimes Bordeaux mixture does some injury to the plants. Properly prepared Bordeaux, however, will not burn the leaves, but it is necessary to see that the solution is alkaline; that is, the lime is added to neutralize the acid effect of the blue vitriol, so that it is sometimes necessary to test the solution with litmus paper to be sure that the solution is alkaline. This will guarantee that the solution will do no damage.

It is quite easy, also, to control potato beetles or potato bugs while spraying for blight by adding 9 pounds of arsenate of lead paste, or one-half as much of the powder to 75 gallons of Bordeaux mixture.

It has been found that the application of Bordeaux keeps the plants in such good condition that it is profitable to use this spray where attacks of blight may be even light. It is simply crop insurance and a crop which requires a high overhead, such as potatoes, yet returns large profits, justifies the use of some form of insurance from disease.

SPRAYING POTATOES FOR BLIGHT

New Hampshire Guernseys Sold in Washington

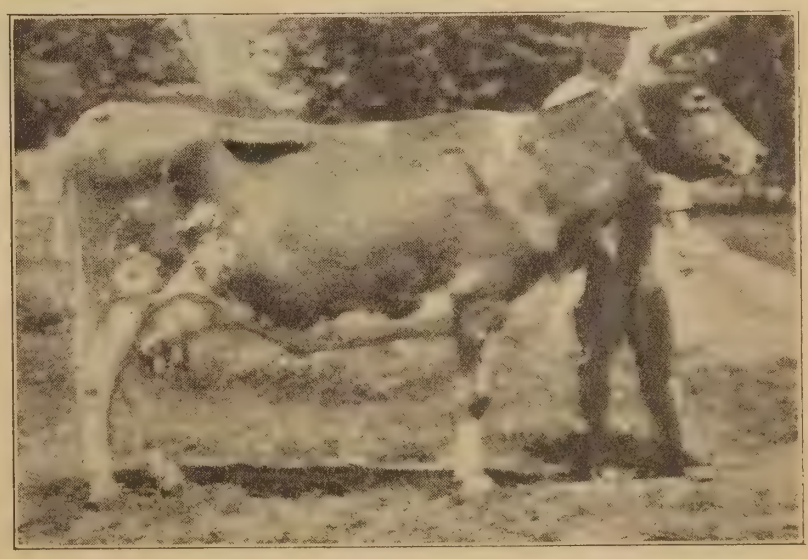
G. N. ANGELL, WASHINGTON

THROUGH the activity of pure-bred dairy cattle breeders of the state of Washington, particularly of the Yakima Valley Guernsey Breeders' Association, practically the entire dairy herd of the Canterbury Shakers at Canterbury, New Hampshire, including 24 Holsteins and 30 Guernseys, has been transplanted from the Atlantic to the Pacific Coast. In the case of the Guernseys, at least, the herd has been kept almost intact in one district, so that the cumulative results of years of breeding along definite lines will not be entirely lost. The importation of the Guernsey herd is the direct result of the visit to the Pacific Coast last winter of Assistant Secretary F. B. Hills of the American Guernsey Cattle Club. At that time, with his assistance, several local breeders' associations, including that in the Yakima Valley, and a state association were formed. A little later agitation was started for the purchase of some pure-bred Guernseys. Breeders of Washington were disappointed in not securing any part in the importation of young stuff from the Isle of Guernsey, which was planned by Oregon breeders, and when the work on eastern purchases was first started early in March, it was thought that the associations in Clarke, Island, and San Juan counties would share in the importation. This plan did not materialize, but several requests were received from other counties for Holsteins and Brown Swiss, and among them was one for a carload of Holsteins for distribution among individuals, banks, and calf clubs in Stevens County. The assistance of Karl B. Musser, state college dairy extension specialist, and of J. N. Price, agricultural agent in Yakima County, was enlisted, and the Yakima breeders began assembling information regarding summer sales in eastern states and regarding possible sources of private purchase.

Early in May Mr. Price and J. L. Wallace, vice-president of the Yakima association, left for the East in time to visit several herds in Minnesota and Wisconsin before attending the annual meeting and sale at Chicago and Midlothian, Ill. There they learned of the impending dispersal of the Canterbury Shaker herd in New Hampshire. After a few days spent in Ohio they visited the Harbor Hill Farm on Long Island, New York, where they bought seven head, and Branford Farm in Connecticut, where they secured three. Upon reaching Boston they were informed that a deal for the sale of the Shaker herd was practically completed, but through the intervention of an officer of the Massachusetts association they were given an opportunity to price it, and purchased 54 animals at a figure which Mr. Musser says will never be duplicated in the West, considering the blood lines secured.

Mr. Wallace took charge of the shipment of Guernseys, totaling 40 head, while J. Wesselius, another member of the Yakima association, delivered the Holsteins, 23 females and one bull, to a Stevens County representative at Spokane. The date for the Yakima breeders' sale was first set for June 18, but after the six days' trip by express across the continent it was decided to postpone the event one week in order to condition the animals, and the state dairy extension specialist took immediate charge of them at the fair grounds near Yakima, spending 10 days there. He was later joined by Mr. Price. Both were made honorary members of the association in recognition of their assistance.

The sale, June 25, was made the occasion of a picnic for members. After adding to the cost of the animals the expense of securing them, each of the 40 head sold had been appraised, and only members of the association were allowed to bid, unless this appraisal price was not reached. Only one or two of the animals failed to bring the appraised valuation, however, and all of them went into hands of members. Moreover, about eight per cent of the bid values was rebated to members in the settlement following the sale, one of the results of which was the formation of the Yakima Guernsey Bull Club at Yakima, where six breeders secured an interest in Harbor Hill Pioneer, the yearling bull from Long Island purchased by J. B. Vance, and where the youngster will be given service for the present on about 60 grades and pure-breds.



The greatest interest centered in the members of the Canterbury herd, 20 head of which were taken by breeders living near Outlook, Yakima County. The Twinkling Lily family from this herd, all but one of which went to Outlook, was first in the ring. This family, consisting of Twinkling Lily, a 10-year-old granddaughter of Lily Bell of Canterbury, and her three daughters and three granddaughters, has produced only one bull in three crops of calves. Its

(Continued on page 56)

THE SEVEN MEMBERS OF THE TWINKLING LILY FAMILY SHOWN AVERAGED $335 EACH IN THE SALE OF THE YAKIMA VALLEY GUERNSEY BREEDERS' ASSOCIATION AT YAKIMA, WASHINGTON, JUNE 25

They are from the Canterbury Shaker herd of New Hampshire. Three daughters and three granddaughters are in the group, and all except one went to breeders in the vicinity of Outlook, in the lower Yakima Valley.

THIS VETERAN OF THE CANTERBURY SHAKER HERD, BRED IN MAY TO FAWNEY'S GOLDEN SECRET OF APPLE TREE POINT, BROUGHT $400 IN THE SALE OF THE YAKIMA VALLEY GUERNSEY BREEDERS' ASSOCIATION AT YAKIMA, WASHINGTON, JUNE 25

She is 14 years old, is a granddaughter of Lily Bell of Canterbury, and was picked for the Panama-Pacific Exposition in 1915. Merrimac's Blossom 21989 is now at home on the farm of C. A. Prickett of Washington, and 19 other members of the Shaker herd are in the immediate vicinity.

Dairy Reflections of an Ex-Tester

PAUL T. MENZEL, MARYLAND

THE average farm, as a general rule, has the correct number of cattle to maintain the proper soil fertility, but the great cry is: "If I could only get more milk from my cows then it might pay me." As Professor Rasmussen has said, the need is not so much for more cows as for more milk per cow. It is simply an application of the basic principle of all business, namely to increase profits by increasing the productive efficiency per unit of machine and thereby lower the cost of production.

A recent survey by the city of Rochester, N. Y., revealed the fact that the cost of producing a quart of milk by cows averaging 8,000 pounds of milk a year was 8 cents and for cows averaging 4,000 pounds the cost was 15 cents a quart. These figures are all the more significant when we consider that they were based on 2,300 animals.

The results of cow testing records in Wisconsin are as follows: Cows averaging a yearly production of 5,000 pounds gave a profit of $45 over feed cost, those in the 7,500 class returned a profit of $103, and those cows averaging 10,000 pounds a year made a return of $161 over feed cost. These sets of figures are sufficient proof that it pays to have good cows and that when production is doubled, profits are increased three to fourfold. Moreover, it refutes the prevalent notion that high producers eat so much more than low producers that they do not make more profit in the end.

Further proof of the economy of production by high producers is furnished by the same Wisconsin data, which shows that cows in the 5,000-pound class had a feed cost of $94, those in the 7,500-pound class a feed cost of $115, and the 10,000-pound class cost $137 for feed. This shows that the heavy producers did cost more to feed than the low and medium producers, which is what one would naturally expect. However, it shows that although increased production causes greater feed cost, the increased cost is not in proportion to the increased profit. Increased feeding to cows of heavy milking ability is really an investment, and supports the saying of many experienced dairymen that the more feed a cow can stand the more milk she will give. From these figures we find that an increase of 47% in cost of feed made the profit 3½ times larger. The manufacturer would give a king's ransom for any means by which he could increase his profits to such an extent, and yet thousands of dairymen are drifting along in the same old way as their fathers did generations ago, with the scrub cow and the scrub bull and feeding by scrub methods.

The dairy millennium will never come until the dairy world has been converted to the gospel of "Feed, Weed, and Breed". The most powerful and effective force in bringing about this conversion is the cow testing association. Association work and its attendant extension work, such as co-operative buying of feeds, service in purchase of good stock, etc., is a more important factor in greater economy of production and the consequent increase of profit and eventual lower price to the consumer than the cost of feed, labor, equipment, marketing, and incidentals. This may sound absurd, but let us consider the facts. Everyone knows that the cost of the latter group of items is always a variable thing but that it always bears a definite relationship to the price received for milk. When the cost of all these things was low the price of milk was low, and now when they are high the price of milk is correspondingly high.

Malcolm H. Gardner, Superintendent of the Holstein Advanced Registry, who is well qualified to speak on the value of record keeping and what it has done to improve the great breeds of dairy cattle to their present phenomenal degree of productiveness, has said: "Cow testing associations pave the way and increase the demand for better breeding stock, and testing for the Advanced Registry assures a supply of pure-bred cattle of merit to meet that demand. Had we 50 such associations where we have one, millions of dollars could have been saved this year that will be wasted in feeding unprofitable cows." This was said during the war, when the government was sending millions of tons of food to the allies and when the most drastic conservation was needed. Today we are not under the obligation of exporting huge quantities of foodstuffs, but the high cost of living is a menace to our economical stability and prosperity to a greater extent than during the war. Increased economy of production is therefore more urgent than ever.

Mr. Gardner's statement in regard to the waste of feed on unprofitable cows is borne out by an example which is only typical of thousands of others. A certain dairyman in Minnesota sustained a loss of $59 over feed cost from his herd of thirty cows. From his testing records he was able to weed out half of his herd and at the end of the next year he made a profit of $69. Not only did his records make it possible for him to put his herd on the right side of the ledger, but he milked fifteen cows less a day, which easily saved four man hours, and he could have put the money he received from the cows he sold into the bank and allowed the interest to make as much as the profit was when he still milked the remaining animals which were needed to maintain soil fertility.

Proper feeding is the first step toward conversion to better dairying. The experience of a Delaware farmer is representative of what countless other milk producers have experienced. He was having his cows tested and at the milk station one morning one of the other patrons asked: "Harry, what good is this young fellow who comes to your place to find out how much cream your cows give? He doesn't make your cows any better, does he?" "No," was the reply. "He's only been coming two months and he can't make my cows any better, but he told me how to feed them and now I'm getting 50 pounds more milk a day and it doesn't cost me any more for feed. Jim Clark milks 16 cows and says he was feeding half a bag of feed more than he needed to, and he is now getting just as much milk as before. I'll tell you, a fellow don't know how much to feed a cow unless he does weigh the milk and, what's more, you know yourself that none of us fellows know what to feed a cow. That tester has made a study of it and the first time he came around he asked me what I was feeding. When I told him bran and corn, he took his pencil and in a minute told me how much brewers grains and cottonseed meal to add to what I was feeding. It's just like everything else, and it pays to let somebody do it for you that knows how. We farmers don't have time to keep records and it costs so little that it is certainly worth while to know what to feed your cows and just what they are doing, and, believe me, I've got a couple cows that are worse than I thought they were and they're going to the butcher as soon as I can get something better to take their places."

Countless examples like this one could be given, and specialized dairymen know that feeding right is as important as having good cows.

In a herd in which every milking was weighed from every animal several animals produced just about the same amount of milk during the year. Four of the cows were very close together in milk production. One cow had an average fat test for the year of 3.7%, another 2.7%, one of them 3.3%, and the other one 4.1%. These were wide variations, but the most able cow judge could not have been able to tell what percentage of fat each would test, even by looking at the milk from each animal.

I am forced to smile as I think about the time an old mossback who did not believe in testing, said: "I don't need to have my cows tested. I can tell how rich the milk is by the taste of it." It's too bad he doesn't make his ability known, for he could do away with the trouble and expense of testing for butterfat, would revolutionize the dairy industry, and could make a fortune for himself merely by tasting the milk of just as many high producers as his wonderful sense of taste could handle.

Anybody who has ever milked a cow for a year or even a few months at a time, knows that some cows start off with a big bucketful and after a month or two they drop off very badly. After five or six months they don't give enough milk to pay for the trouble of milking them. Such cows, however, are so noticeably lacking in persistency that it is not hard to find them out. The cow that drops off so gradually that you don't notice it, is the one that will fool you the worst. Without weighing the milk one would not notice a difference of a quart or so between one milking and the next. Persistency is one of the biggest factors in making a good record, and it cannot be accurately kept trace of except by the scales and records, at least weighing the milk once a month for several milkings.

Scrub bulls have more to do with the cost of milk production than feed cost, labor, and all the other important items. The scrub bull has no hope of salvation and must be gotten rid

PERSISTENCY AT IOWANA

IOWANA BETTINA IOWANA MISS FAYNE

IOWANA Farm Holsteins furnish many examples of persistent production. The daughters of the famous sire of yearly record cows, Sir Johanna Fayne, rank high in the breed. Eight have produced more than 20,000 lbs. milk in a year. Sixteen average over 20,000 lbs. milk, 618 lbs. fat. In Volume 29 of the Holstein-Friesian Advanced Register Herd Book, 28 of the 45 daughters listed are winners in the association prize lists or have been debarred by previous winnings. The average production of his yearly tested daughters three and a half years old or over is 21,545.8 lbs. milk, 662.07 lbs. fat.

Now the daughters of Oak De Kol Ollie Homestead, National Dairy Show grand champion, are piling up records to maintain the high mark set by Sir Johanna Fayne. Two of these daughters are here shown. At the right is Iowana Miss Fayne. She freshened first as a two-year-old in December, 1915. In four years and four months she produced 66,893.2 lbs. milk, 2,121.86 lbs. fat, and four living calves. Iowanna Bettina, at the left, dropped her first calf in February, 1916. In four years she has made 55,307.3 lbs. milk, 1,692.78 lbs. fat and has six living calves, including two pairs of twins. Both cows are now on test and safe in calf.

Such persistency is the highest attribute of the dairy cow. It is the difference between a discouraging mediocrity of results and the greatest possible returns from the herd.

of, the sooner the better. I have heard farmers say that they know of scrub cattle, that is, grades, that are better than some pure-breds they have known. That may be true, for unfortunately there are also some scrub pure-breds, but no one can deny that whatever excellence a grade may have, she obtained from either a pure-bred sire or dam. The world's champion grade cow, Alice, with a record of 20,099 pounds of milk and 729.1 pounds of fat, and another cow with a record of 14,858 pounds of milk and 725.3 pounds of fat, never got their ability from a scrub bull. Their excellence, like that of all other good grades, is due to pure-breds. In one cow testing association a member started in ten years ago with a pure-bred bull for which he paid $50, and the next bull cost $100, and the last two he obtained for $150. From the 17 milking head of grades, all of his own breeding, he was able to select one cow with a 13,000-pound record, two with nearly 12,000, and seven more with over 10,000 pounds. Last June I saw him at the big Holstein sale in Philadelphia, and he had a smile a mile wide. When I asked him the reason, he said: "That young bull they just sold is a full brother of the bull that I bought last year, and if he just brought $1,200, then mine ought to be worth as much. Mine only cost me $350, but his dam was only a two-year-old then."

Many farmers hold back from buying a pure-bred bull because they think the price will be too stiff. In many states the various breeders' associations have agreed to trade a scrub bull for a pure-bred bull calf. That may sound fishy, but it's perfectly sane. Any kind of a bull weighing 1,200 to 1,500 lbs. will bring $100 or more from the butcher, and for that sum you can get a bull calf that will improve the average farm herd at least 1,000 lbs. of milk per animal, if he is any good at all. If a farmer is interested in such a proposition all he has to do is to get the county agent to get in touch with some of the breeders of the breed he prefers. If the farmer is not well acquainted with the dairy breeds it would be best to consult the county agent for advice as to what breed would best suit his conditions. When he has decided on that point, the agent can help him by his knowledge of the reliability of the various breeders and by his ability to determine the value of the breeding of the animals offered. Under no circumstances should a farmer buy a bull that is just pure-bred and that has no production record behind him, for good individuals of known ancestry can be gotten so cheap that it doesn't pay to have anything else.

Dairying is a profitable industry, if it is done along efficient and scientific lines, a thing that any farmer can do, and which costs no more than milk production by scrub feeding, with scrub cows, and by using a scrub bull. Get into the game for greater profit—feed, weed, and breed.

National Dairy Union Finances

Balance on hand June 1, 1920	$4,457.89
Total receipts	221.66
	$4,679.55
Total disbursements	$284.33
Balance on hand July 1, 1920	$4,395.22

This is to certify I have today audited the books for Geo. Caven, treasurer of the National Dairy Union, and find the receipts from June 1, 1920 to June 30, 1920 to be $221.66, and the amount paid out for which he holds vouchers, the sum of $284.33, leaving a balance on hand July 1, 1920 of $4,395.22.

F. P. COLLYER.

Dairying Thirty Years Ago

Notes from the Issue of Hoard Dairyman for Thirty Years Ago This Week

The question, "Which is the best breed", seems quite as well answered then as now for the following statement is quoted: "The most profitable dairy cow does not belong to any one breed, at least it has never been demonstrated that she does".

Cheese was reported to sell for $.50 to $.75 per pound in Honduras and the editorial statement was made: "We believe that a great market for cheese, and perhaps butter, could be opened up in South America and Mexico if we had some live statesmanship and enterprise to make the start and give them a good article at a fair price".

A production contest at a Canadian fair between heavy milking Jerseys and "show vessel" Ayrshires, whose "breeding, keeping, and feeding has not been such as to merit the position of first class pure-bred Ayrshires", drew forth the editorial comment: "Slowly an idea is beginning to break into the minds of dairy breeders and dairy farmers that the dairy functions in cattle are just as clearly the result of careful and intelligent breeding and subsequent care and handling as are the qualities of speed in horses, or the powers of scent in hunting dogs. The progress of true knowledge in this respect has been retarded woefully by the 'hit or miss' unscientific slush of 'general purpose' ideas, among certain interested breeders, and farmers in general. To such ideas is due the degeneracy of the Shorthorn breed of cattle for dairy purposes. Such ideas will degenerate any breed, no matter how clear and distinct their dairy qualities may be. To the opposite ideas, viz., specific purpose breeding and handling, is due the grand progress which the Holsteins, Jerseys, Ayrshires, and Guernseys have made as dairy cattle."

The "achievement" of the Holstein cow, Parthenea, which made 38 lbs. 8½ oz. of butter in 7 days, in an average of 78 lbs. 5 oz. milk, was used to illustrate the editor's belief that "the cows of any breed that are the most copious milkers will not be, as they have not hitherto been, the phenomenal cows for yielding butter". Lower butter record cows had already been credited with 95 to 112 lbs. of milk per day.

A Kansas subscriber asked whether a silo built of stone would do "good business" and was advised that "In that land of light winters we should not object to the silo of stone".

Hot weather had lowered the quality of cheese so greatly as to "entail a heavy loss", many cheese being paid for "at only half or little more than half the price at which they were reported sold".

A lively discussion was being waged concerning the "butter extractor" for which the following excellencies were claimed: (1) Obtains more butter by saving the fat left in buttermilk in churning. (2) Dispenses with the churn and the power required to use it. (3) Reduces cost of making butter, and (4) Improves keeping qualities. Those who denied these virtues claimed the butter formed by the "extractor" was of poor body and that there was a heavy loss of butterfat in the skimmilk.

LILLIE BURKE CANARY, OWNED BY ADOLPH P. LEHNER, WISCONSIN

This cow has just completed a record of 33.035 lbs. butter and 586 lbs. milk in seven days. Her best day's milk was 94 lbs. As a junior three-year-old she has a 26-pound record and as a 24-month heifer she made 17 lbs. butter in seven days.

An article on "How to Drink Milk" was quoted from the New York Tribune under the sub-caption, "One glassful gives more real strength than a barrel of beer". An excerpt from the quotation follows: "Don't swallow milk fast and in such big gulps. Sip it slowly. Take four minutes at least to finish that glassful, and don't take more than a good teaspoonful at one sip."

Believing that the feeding of oleomargarine to the insane of the state "has a tendency to create a disturbance of the stomachs of the patients" the authorities of Michigan were moved to order that butter be supplied in its stead.

"When the 'witches' get into the cream and the butter won't come, hang a horse-shoe over the dairy door and then find out the reason why the butter doesn't come. If the cause proves to be too low temperature of the cream and the thermometer you use is one of your fingers, take down the horse-shoe, hunt up enough more of them to sell as old iron for 50 cents and trade the half dollar for a good dairy thermometer. This will bring whole piles of 'luck' into your dairy and keep out a good many 'witches'."

Abortion Control in Wales

Mr. R. Hedger Wallace, of the University College of South Wales, England, writes that the county of Glamorgan, Wales, has issued the following order in the effort to control the spread of contagious abortion in Wales:

"For the purpose of preventing the spread of Epizootic Abortion, the Local Authority for the County of Glamorgan hereby—

"Prohibits the exposure by any person in any market, fair ground, or sale yard within the District of the Local Authority of a cow or heifer which to his knowledge or according to information furnished to him, has calved prematurely within the two months immediately preceding such exposure;

"Prohibits the sale by any person within the District of the Local Authority of a cow or heifer which to his knowledge or according to information furnished to him has calved prematurely within the two months immediately preceding such sale, unless before the sale he shall have given to the purchaser notice in writing of such premature calving.

"If any person exposes an animal for sale or sells an animal, or causes an animal to be exposed or sold, in contravention of these Regulations he shall be deemed guilty of an offense against the Diseases of Animals Act, 1894."

One way to make country life more attractive is to beautify the farm both indoors and out. It's the outdoors we think most about in summer; flowers and shrubs help.

SIR BESS ORMSBY FOBES. THIS HOLSTEIN BULL MADE TWO WISCONSIN FARMERS A PROFIT OF $24,400

THREE years ago two Wisconsin farmers paid $600 for a Holstein bull calf. He was out of a cow with a seven-day butter credit of 24.25 lbs. and a fat production for a year of 569.68 lbs. in 14,869.9 lbs. milk. His sire was Sir Pietertje Ormsby Mercedes 37th. Since his purchase, the dam made a 26.03-lb. butter record for seven days and produced 922.36 lbs. fat in 24,535.5 lbs. milk in a year. Animals of his sire's breeding have gained greatly in popularity through their large production.

Early this month his owners, Otto Schinke and B. W. Rabenhorst, sold this bull to Hollyhock Farms, Wisconsin, for $25,000 and retained the privilege of breeding ten cows to him. They had at least two other opportunities to make sales at near this valuation.

Their neighbors speak of the "luck" of these two men. They consider this profit and the greatly increased value of the two herds through the use of this sire to be the result of good fortune, a happenstance, and say: "They are lucky." They fail to give credit for the faith in good breeding which prompted the purchase in 1917 or the courage needed by two men with small herds to pay $600 for a bull calf.

There is no formula for such transactions as this—no set of rules a breeder can adopt and "go and do likewise". But the experience of Rabenhorst and Schinke is not all "luck", by any means. They followed the safest plan for buying a bull which it is hoped will develop into a valuable animal. They purchased into a family of cattle owned largely by men who would develop them. Recognizing the worth of yearly records they sought "long time" blood. They went to see calves by a sire of splendid individuality. He had type and production back of him, was young, and owned where his daughters, sisters of the bull calf, would be well grown and given records. His daughters would be out of good cows. Satisfied with the sire, they sought a calf out of a good cow. They found a dam which filled their requirements in Wisconsin Fobes, a cow which had a fair yearly record, was from a family of producers, had proved herself a good breeder, and had the conformation of a real dairy animal. Finally, the calf himself. His breeding was right but his type must be the best obtainable. How well the young $600 calf filled this last qualification is indicated by the fact that he has developed into one of the very best three-year-olds in the country.

The recent sale was not "all luck". These men made use of every safeguard in buying. They took no chances. They could have bought cheaper bulls had they been willing to lower their requirements. Their purchase of Sir Bess Ormsby Fobes has brought a liberal reward for their faith in good sires. Their experience may not be easily duplicated but it offers an inspiration to breeders who will exercise as much care in the selection of their next sire.

Safe Water for the Dairy

(Continued from first page.)

edied, those first enumerated. The location of the privy or cesspool vaults may be changed, but even so the ground in the vicinity of the old vaults will be highly charged with impurities and will so remain for a long period of time. The relocation of barnyard and hog pen may be impractical or at best attended with difficulties. If such be the case, the only way out, if it is found that the water supply is unsafe, will be through a deep driven well. Ordinarily, the factors of which we have been speaking do not have much influence on a driven well which picks up its water from a deep level, save in instances where the well casing or its joints are imperfect or where there are faults in the geologic formation which extend to considerable depths. In one southern city a public well over a thousand feet deep had to be abandoned because of surface contamination which found its way to this depth through faults and crevices in the rocks.

After this resume of possible sources of contamination of water supply with sewage and waste, one is interested to know how the ordinary dairyman may assure himself that the water from his well is safe to use. In most instances—indeed in all instances where absolute certainty is desirable—an analysis and examination by a competent person is essential. There are, however, several ways in which an approximate idea may be gathered by any farmer in regard to the state of his water supply. If his well is of the dug variety he should consider, first of all, the likelihood of seepage from barnyard, privy vault, and so on. He should look at the matter candidly—having in mind the general contour of the surroundings and with the understanding that the area of infection may include a circle drawn around the well, the radius of which circle may vary from one to several times the depth of the well.

While lack of taste, odor, and color in waters from dug wells is no indication of purity, the presence of such is a pretty reliable sign that everything is not right. Indications of this kind point to the necessity of an analysis. If the well is a driven one, turbidity or roiliness should be regarded as a signaling for attention, though it is possible for such to come from harmless causes. However, driven wells often leak water from joints and corroded surfaces and surface contamination may work in. If the leak is bad it may perhaps be detected by placing the ear against the pump, or it may be seen in some cases by removing the pump and throwing a beam of light down the inside of the casing by means of a mirror. With leaky casings that admit contamination the pipes must be replaced by new ones, save where the trouble lies so near the surface that it can be remedied by use of cement. Odors and tastes in deep well waters are as a rule less to be feared than those in shallower wells. Water from a depth is apt to be more highly charged with minerals and dissolved gases. The pipe which brings it up from below not infrequently imparts a slight iron taste.

A water analysis will cost, perhaps, from $15 to $25, depending upon how thorough it is and the standing of the person who makes it. The value of such an analysis is in direct proportion to the knowledge and experience of the one who makes it and interprets it. It is possible to tell many things by a determination of this kind. First of all the presence of sewage can be determined with accuracy. It is possible to tell whether the water has received its dose of impurity from a nearby source or from a point considerably removed both as to space and time. It is possible, also, to distinguish in most cases whether the sewage content comes from the privy or the barnyard. How all this is done would be too technical to explain in this article, but as a matter of general interest it may be said that a thorough examination of water takes account of the presence or nonpresence of the colon bacillus. This is an organism that inhabits the intestinal tract, or part of it, of both man and the farm animals. This bacillus occurs in very great numbers, therefore, in all human excrement and in the usual farm wastes. If it is found in a water supply it is positive evidence that "sewage" has found its way into it. Whether the sewage is of human or animal origin may be determined with fair accuracy by other factors. Human excrement carries more chlorine than that of animals. The slop water from the kitchen sink is also high in chlorine. Where the amount of chlorine in water is high and there appears no slop water influence from the kitchen drain it is a reasonable inference that the privy vault or the cesspool, if there is such, is responsible in part, if not wholly.

The approximate source from which the contamination comes—both in point of distance and recentness—can be inferred from the results of the several chemical tests which are made. It is quite possible for sewage contamination to be picked up by ground water at some distance from the farm, or it may be the result of a direct seepage from vaults or barn surroundings. With an analysis before him a person skilled and experienced in such things can tell approximately the situation without visiting the location. If any doubt exists an inspection of the premises will invariably remove all uncertainty. Safe water for the dairy is essential—quite as much as in the farm home. Milk is an ideal carrier of germs. An unsafe water supply used in the milk house is certain to result in contamination of the product sent forth.

Wayne County, Ohio, Breeders Meet

For doing things in a Holstein way the Wayne County Holstein Breeders of Ohio are a live bunch. On July 1 the committee previously appointed to select cattle for the Wayne County Exhibit at the Ohio State Fair spent the day looking over the Wayne County herds. The field secretary accompanied them and by night the committee had found enough good cattle to make the exhibit practically sure.

That evening some fifty of the breeders met at the Orrville City Hall. A feed committee was appointed to investigate the advisability of buying concentrated feeds co-operatively. It was decided to have a Holstein tour of the county some time in the near future. On this tour six or eight Holstein farms will be visited and something of particular interest will be discussed at each farm. At noon a basket dinner will be served. This club set out at the time of its organization to do away with the scrub bull in their county and much good has been gained.

Ohio. HOWARD BARKER.

Jersey Cattle Notes

For week ending July 9:

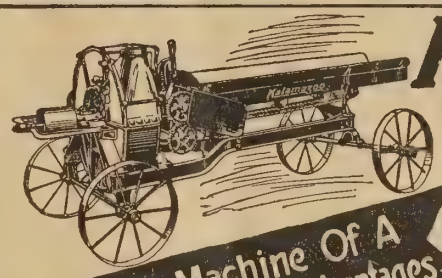
Number of animals registered: Bulls, 125; cows, 530; total, 655. Number of transfers recorded: Bulls, 280; cows, 827; total, 1,107.

Creaking doors and squeaking bureau drawers become mute if rubbed with hard soap.

STRENGTH

A High Grade Milk Can at a Low Cost

Buy "Direct from the Manufacturer" with all the economy this gives. Made from cold rolled, open hearth, velvet finished, sheet steel the CP Heavily Tinned Milk Can will outlast two or three of the ordinary kind. Interior is absolutely smooth. No seams to catch bacteria or dirt.



THE ELGIN PATTERN is a shipping can. Has Guardian bottom, patented hoopless, heavy gauge, one-piece, double rimmed Paragon cover. Will stand up under severe treatment. Price, 5 gal. $4.30, 8 gal. $5.90, 10 gal. $6.15

THE CLIMAX PATTERN is a long-lived can for delivering milk or cream. Lighter than Elgin but is strongly constructed, heavily tinned, and smoothly soldered. Has 20th Century handles, Paragon covers. Price, 5 gal. $3.80, 8 gal. $4.65, 10 gal. $4.85. All cans F. O. B. Chicago or nearest branch. *Send for Big Mail Order Dairy Catalog.* Prices guaranteed until Aug. 13, 1920.

5 gal. Climax each 3.80

Kansas Free Fair, Topeka, Kans., September 13—18. P. Eastman, Secretary.

Kansas State Fair, Hutchinson, Kans., September 18—24. A. L. Sponsler, Secretary.

Eastern States Exposition, Springfield, Mass., September 19—25. J. C. Simpson, Sec.

Trenton Interstate Fair, Trenton, N. J., September 27—October 1. M. R. Margerum, Secretary.

Vermont State Fair, White River Junction, September 28—October 1. F. L. Davis, Sec.

Dairy Cattle Congress, Waterloo, Ia., September 27—October 3. E. S. Estel, Secretary.

National Dairy Show, Chicago, October 7—16. W. E. Skinner, Manager.

Prizes at Kentucky Fair

Premiums of $500 in cash are offered for Jersey cattle and $500 for Holsteins at the Blue Grass Fair, Lexington, Ky., the last week in August.

Mr. I. W. Cooper of Allen Dale Farms, Ky., will act as judge of Jersey cattle. J. J. HOOPER.

Iowa Dairy Rally

HOARD'S DAIRYMAN:—The "Iowa Dairy Rally" was held at Waterloo, July 14th and 15th, to exhibit to the people engaged in county agent work, home demonstration work, and other educational work the various processes of this important industry. It is realized by few that this is such an important industry which in Iowa last year had a valuation of cattle and products in the amount of almost $300,000,000. There seems to be a considerable awakening to the advantages of maintaining dairy cattle on Iowa farms and there is certainly an increasing realization on the part of the consuming public that milk and its products are not only the most economical foods which can be purchased at the present time, but that there are also elements contained which are highly essential to the health and growth of both children and adults.

The meeting was very largely attended. The two days were devoted to a study of dairy products, dairy cattle breeding, and the marketing of dairy products. The first visit was made to the farm of Mr. W. W. Marsh, where one of the most uniformly high producing herds of Guernseys in the United States is owned. While visiting this farm, a very interesting discussion of the tuberculosis eradication work which is being conducted in Iowa in co-operation with the federal government was led by Dr. J. E. Gibson of Indiana. At the present time almost two thousand herds of cattle in this state have been placed under the supervision of the Agricultural Department at Washington. Requests for supervision of additional herds are coming much more rapidly than can be cared for by the forces operating in Iowa. Dr. Gibson very effectively discussed the financial needs for the continuation of this work. He also set forth very clearly the value to the country of the ultimate control or eradication of this disease which is at the present time so prevalent among cattle.

Following this, a visit to the manufacturing and distributing plants for dairy products was made. A visit was also made to an ice cream plant which afforded the visitors an opportunity to learn much of this form of marketing. It was learned that the ice cream industry in the United States today is providing a market for the production of five million cows annually and that in Iowa last year, over six and a half million gallons of ice cream were sold. A visit was also made to the Orange Township Creamery. These visits gave a very clear idea of how dairy products are handled while being transformed into merchantable articles. The fact was developed that the producer of dairy products receives a larger proportion of the consumer's dollar, than in any other agricultural product. The average amount which is received by the producer of the consumer's dollar has been 38c in the past few years, but at the present time it is only 31 cents. In dairy marketing, the cost of handling and distributing as well as manufacture rarely exceeds fifty per cent and in most cases as much as two-thirds and three-fourths of the consumer's dollar is paid to the producer for the raw material. This seemed a very favorable matter for the system of marketing dairy products and also it appears should be an inducement to confidence in increased production.

Mr. M. D. Munn, President of the National Dairy Council and of the American Jersey Cattle Club, gave many ideas of the value of dairy cattle and dairy products and also a very thorough discussion of the present world-wide food situation.

A visit was made to the farm of John Cunningham, an average Iowa farm. Six years ago Mr. Cunningham was milking a herd of red grade cattle and securing an annual production per cow of about 275 pounds fat. In six years he has developed his herd to the point that he now owns only pure-bred Holsteins and has an average production per cow of approximately 380 pounds of butterfat. This was pointed out as a demonstration of what can be accomplished through the work of the cow test association. Helmer Rabild of the Dairy Division reviewed the accomplishments of cow test association work. A visit was made to an Ayrshire herd which is being operated on a 20-acre farm very profitably, at which time Mr. J. G. Watson, Secretary of the Ayrshire Breeders' Association of America, brought out the fact that the policies of the Ayrshire breed are to develop uniformly good cows both in type and production without making the greatest effort to produce unusually high records as has been done by some of the other milk producing breeds.

Mr. Watson referred to the fact that the Ayrshire cattle have not been used in Iowa to the extent that they have in many of the other middle west states and much less than in the eastern states and that efforts will now be made to bring realization on the part of dairy producers of the Middle West of the real serviceability of this breed of cattle.

Hon. G. N. Haugen, chairman of the Agricultural Committee of the House of Representatives, was present and gave a very thorough discussion of the work which this committee is doing and also a thorough disclosure of the reasons for the curtailment throughout the Department of Agriculture. He made reference to the splendid work which is being done in the eradication of tuberculosis, hog cholera, and black stem rust and showed how meagre the cost of such work has been in proportion to the results which have been accomplished. In all the appropriation for the work under the control of the Department of Agriculture approximates $140,000,000 annually. A decrease in appropriation slightly over $2,500,000 is all that has been made by the committee and it was Mr. Haugen's impression that this would not materially affect the real service which has been rendered by the Agricultural Department.

Visits were also made to the Maxwell Farm of Holsteins where the work of producing records under Advanced Registry conditions was discussed. Mr. McBride, manager of this farm, explained much of the system of management and feeding of cattle. He also discussed the system of breeding which is being accomplished upon this farm. At the Waterloo Jersey Farm, Mr. Van Pelt gave a very thorough discussion of the breeding practices which were being employed on that farm, exhibiting "Financial Beauty", a very strongly line-bred Jersey cow, and her offspring of several generations, both male and female. Other features of the breeding operations of this farm were displayed. It was also learned that from a herd of 28 milk cows an average of $71 worth of milk per day is being sold. Other speakers who added to the interest of the program were Miss Jessie Hoover, Milk Utilizing Specialist of the Department of Agriculture; Professor Mortenson of the Dairy Department, Iowa State College; J. V. Lingenfelter, Secretary of the Iowa Milk Marketing Association; Dr. Amy Daniels of the Child Research Institute at Iowa City; and Professor A. L. Haecker of Nebraska.

The purpose of this rally was very fully accomplished. Ideas were suggested to the county agents in particular of how and when work may be done to develop the industry in each of the counties in the state. Suggestions were dropped by many county agents that there seems to be a real interest in the production of dairy products developing in the southern part of Iowa which has been very low in this branch of agriculture. Satisfaction seemed to be evident among the visitors as well as those in charge that a very interesting piece of work had been done to stimulate the dairy industry in Iowa. SUBSCRIBER.

New York Guernsey Meeting

The Bi-state Guernsey meeting will be held August 7 at Glens Falls, New York, at Suburban Farm. Mr. James H. Seaman, proprietor, has invited the Guernsey breeders of New York and Vermont to attend. Breeders from other states will be welcome. A splendid program is prepared and a good herd of cattle is available for study.

Gregory Heads Purdue Dairy Department

Professor Howard W. Gregory, for the last four years connected with the dairy department at Purdue University, has been named head of the department to succeed Professor O. E. Reed, who resigned to join the Gossard Breeding Estates.

After graduating from Oklahoma Agricultural and Mechanical College in 1912, Professor Gregory went to the South Dakota Agricultural College where he remained four years as an instructor and in experimental work. He has had charge of the university creamery and he has put this business on an excellent basis. He was reared on a dairy farm and has had experience in both the production and manufacturing ends of the dairy business. With an acquaintance already started among Indiana dairymen, he will make a valuable man for the university.

HOWARD W. GREGORY

Sale Announcements

Aug. 3-4—Holsteins. The Pure-bred Live Stock Sales Co., Brattleboro, Vt.

Aug. 12—Guernseys. Southeastern Guernsey Breeders' Sale, Salisbury, N. C. C. T. Rice, Sale Mgr., Oakton, Va.

Sept. 6—Holsteins. Dispersal of F. C. Brinton, Jr., Herd of Registered Holsteins at West Chester, Pa.

Sept. 10—Holsteins. Rock County Fair Annual Holstein Sale, Janesville, Wis., B. T. Green, Manager.

Sept. 13—Holsteins. Dispersal Dr. R. Ivey and Dr. S. P. Scherer herds, Fishers, Indiana.

Sept. 29-30—Hornless Holstein Farms. Geo. E. Stevenson & Sons Sale at Clark's Summit, Pa.

Oct. 8—Holsteins. Alfakorn Farms Fifth Semi-annual Sale at Evansville, Wis. F. B. Green & Sons, Owners.

Oct. 13—Guernseys. Wisconsin State Guernsey Sale at the Live Stock Pavilion, University Grounds, Madison, Wis.

Oct. 13-14—Holsteins. National Dairymen's Sale in connection with the National Dairy Show, Chicago, Ill. E. M. Hastings Co., Mgrs.

Oct. 14—Holsteins. West Michigan Holstein Breeders' Semi-annual Sale. W. R. Harper, Middleville, Mich., Sec.

Oct. 14—Guernseys. The Southern Wisconsin Guernsey Breeders' Ass'n., Janesville, Wis. James H. Murphy, Mgr., Delavan, Wis.

Oct. 22—Holsteins. Ashtabula Co., Ohio, will hold sale at County Fair Grounds, Jefferson, O.

Oct. 28—Holsteins. Virginia Holstein-Friesian Club Sale at Richmond, Va. R. V. Martindale, Sec'y.

Oct. 28-29—Holsteins. Green County Holstein-Friesian Breeders' Club Sale at Monroe, Wis. L. L. Hare, Monroe, Wis., Sec'y.

Nov. 16-17—Holsteins. Second Iowa Breeders' Guaranty Sale at Waterloo, Ia. C. H. Jenness, Sec.

Nov. 23-24—Holsteins. Watertown Holstein Sales Co., Semi-annual Consignment Sale at Watertown. Wis. Francis Darcey, Manager.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, July 20.—The award of the Railroad Labor Board, announced today, makes certain the freight increase asked for by the carriers. The decision of the I. C. C. can be expected within ten to fourteen days. Everything is set for a tremendous effort on the part of the distributor organizations to make the originators of freight traffic bear this increase, an effort which has been made successfully in the past by distributors of general farm products, butter and cheese. That is, there seems to be, so well informed and reliable representatives of many interests here in Washington assert, a concerted effort to keep prices of commodities to the consumer at present levels, instead of passing along the freight rate, and compelling the producers to accept present prices, less the freight increase. That this will succeed with cereals, meats, and milk seems certain, as at the present time these commodities are delivered in the ordinary course of trade, freight paid to destination. This means that farmer producers of these products will bear the freight on their own products, as well as on the commodities they are compelled to purchase.

The first bulletin from the office of the secretary of the National Dairy Union was issued this week. It contains a reference to the pardon granted by President Wilson to John F. Jelke, convicted but never sentenced for participation in oleo tax frauds some years ago, some comment on the activities of the institute of margarine manufacturers, a resume of one of the important research projects being carried on by the Department of Animal Industry in the study of animal nutrition in milk production, and a comment on the absence of references to the McCollum discoveries and research work in vitamines, in the published material available from the Office of Home Economics of the Department of Agriculture. The National Dairy Union is advising dairymen and creamerymen everywhere to write the Office of Home Economics for their publications on the food value of milk and dairy products, to indicate to the department their interest in its work, and to "show to the public that the department bulletins fail to acknowledge publicly" the points of acknowledged superiority of butter over all its imitations and substitutes.

Bureau of Market Dairy Reports indicate increasing supply, which taken in connection with heavy imports tend to weaken the markets, but with strong demand from storage as a counteracting and strengthening factor. Storage reports show an increase of considerably over a million pounds in the past ten days as compared with the previous week, or the corresponding week last year. The figures for the week, 1919, are: increase in storage butter 5,632,000 lbs.; 1920, increase in storage butter, 6,518,000 lbs. The real feature of the week was the receipt in New York of the heaviest single shipment of Danish butter ever entering this country: 45,440 casks containing 112 lbs. each, a total of 5,089,280 lbs. Another shipment of 1,733 casks is enroute. The bulletin of the market division calls attention also to Canadian shipments, in boxes, and comparatively high scoring, yet which sold slowly in the New York market, and shipments of Argentine stock, off quality and off price.

A strong demand is being voiced by representatives of agricultural organizations here that farmers be placed on some of the great governmental instrumentalities which control the more important functions of the government, outside of the cabinet departments. In particular since the enactment of the Cummins—Esch law governing railroad and inland transportation, and the Jones law governing the American Merchant Marine, it has been found that the commissions created or extended in activity by these laws—the Interstate Commerce Commission, and the U. S. Shipping Board, are lodged with powers of very near life and death to each and every industry. It is this which is chiefly back of the unusual demand which has recently been heard for a farmer on the Shipping Board, and one or more farmers on the I. C. C. Admiral Benson, chairman of the shipping board, in a public statement on Monday of this week, said he would welcome the appointment of a man thoroughly familiar with American agriculture to a position on that body. In the development of the Merchant Marine, which of necessity includes the question of return cargoes, and this in turn involving cereals and meats and other of the products of the cheaper lands of South America, Africa, and Australia, American agriculture becomes interested at first hand, and is fully justified in demanding a place on this important board.

New York Butter Market

NEW YORK CITY, JULY 20—The very sensitive feeling that prevailed in the market, because of the expected arrival of large quantities of foreign butter during the past two weeks has practically vanished. It is very peculiar that such should be the case as the 44,000 casks of Danish butter and the 14,500 casks of Holland butter which arrived last week are not as yet entirely unloaded. However, it is now apparent that a high percentage of that butter will be placed in storage and therefore will have little effect on the market at the present time. One additional factor which has tended to greatly alleviate the feeling of uncertainty that has prevailed is the report of the federal Bureau of Markets which was released recently. That report shows that there are about 38 million pounds of butter less in storage at the present time than at the same season one year ago. The report makes it appear that there is a dangerous shortage of butter in the country at present and that the incoming foreign butter should be a welcome acquisition. It is now fairly certain that shipments of Danish and Holland butter during the next few months will be of very little consequence. England will take practically all the surplus of Denmark and Holland is absorbing all that is being produced in that country.

The market is showing considerably more activity at present than during last week. The principal reason for that is the fact that speculators are buying butter in greater quantities than at any other time during the season. In addition, receivers have placed large quantities of their butter in public warehouses awaiting the time when prices will be higher. As a result of the disposal of butter in these two ways, stocks have been greatly reduced with the result that demand and supply are about equal which is a condition that always tends to produce an optimistic feeling in the market. Were it not for the fact that very little foreign butter will be shipped to this country during the next few months, the feeling would be entirely different. Receivers now feel that there will be a consistent active market throughout the balance of the year.

From Monday until Thursday of last week, the market was as inactive as at any time since the reaction after the railroad strike in the early spring. Buyers were waiting to see what the effect of the arrival of extremely large quantities of foreign butter would be on the market. The price decline from Monday until Thursday was 1¾c. On the latter day, a stronger feeling began to be in evidence as speculators were more active than they had been for some time. On the following day the price advanced ½c. There was no change on Saturday but on Monday there was a further advance of ½c. While there was no change in the quotation today, the market was firm and fairly active and there are indications that further advances will materialize during the course of the next few days. It is apparent that while the market is firm a certain degree of assurance is still lacking because of the presence of so much foreign butter in the city. However, it is generally agreed that as soon as that butter is safely tucked away in storages buying will continue with great activity. Established quotations today are: Extras (92 score), 57c; higher scoring than extras (93 score or higher), 57½@58c; firsts (90—91 score), 55@56½c; firsts (88—89 score), 53@54½c; and seconds (83—87 score), 49@52c.

W. B. LIVERANCE.

New York Milk Committee

An announcement has just been received from the New York Milk Committee that they have established a Service Bureau as an aid to communities in need of better official control of their milk supplies. The bureau is the result of a recommendation made by the National Commission on Milk Standards at its meeting held in New York City during the latter part of May. This assistance may be secured by writing the Service Bureau, New York Milk Committee, 30 Broad St., New York City.

It is the purpose of the Service Bureau to help preach the gospel of clean, safe milk for infants and children by emphasizing throughout the continent the fundamental principles contained in the reports of the National Commission on Milk Standards. The sanitary character of a milk supply is a vital factor in the public health problem of every community and these reports contain suggestions that have been a great help in drafting effective milk legislation in the states of New York, California, and all the cities therein, the Local Government Board of England, besides a great many other cities in America.

Through the meetings of this commission, unanimous reports and recommendations have been obtained. These have been published at various times by the U. S. Public Health Service and furnished to American cities for the first time a basis for uniform standards and grades of milk.

The chief features of the work of this commission have been as follows: A standard time and temperature for the pasteurization of milk; the recommendation that all milk be pasteurized excepting milk corresponding to certified milk in character; that milk be graded into at least three grades—A, B, and C—according to its sanitary character and that each grade be distinguished by its own label on the final container; a standard method for determining the sanitary character of milk by the examination for the number of bacteria.

Montana Guernseys Average over $400 at Sale

The second pure-bred Guernsey sale in Montana brought an average well over $400. This was held by the Bitter Root Guernsey Breeders' Association and was their first sale.

The Bitter Root Guernsey Farm paid $1,000 for Inez Morrill of Cold Brook Farm, a three-year-old heifer, thereby setting a new record price for dairy cattle in that state. The association employed a representative to purchase Guernseys on the Atlantic Coast about three months ago. These arrived in Montana June 4th and after that time were prepared for sale.

The following lists all animals selling for $400 or more and gives the names of their buyers, all being in Montana:

Arthur Schmidt	
Von Don Feldors	$430
Country Maid of Highland	725
Bitter Root Guernsey Farm	
Spots Simplicity	$440
June of Broad Vista	900
Inez Morrill of Cold Brook Farm	1,000
J. W. Randles	
Von Don Sina	$450
Walter Benedict	
Polly's Crensa of Cold Brook Farm	$575
Fernleaf's Helen Marshall	550
Raydame's Lady Corfu of Ayersdale	435
J. Haley	
Nepaul's Takomah	$725
Von Don Stella	440
Durrell Whitcroft	
Grace Berry of Cold Brook Farm	$600

Balmangan Vera, owned by Middlesex Meadows Farm, which J. G. Watson, Secretary of the Ayrshire Breeders' Association, describes as a "typical representative of the modern Ayrshire". She calved in March and made, up to May 1, 2,249 lbs. milk. She is now milking 50 lbs. per day.

EDITORIAL COMMENT

WIRELESS SERVICE FOR FARMERS

Why not make the service of wireless telegraphy available to farmers? The range of benefits it could bring to him is without limit. The fact that this wonderful invention is not already saving agriculture millions of dollars is no reason for its not being adopted now. Its use is practical and its help is needed.

It is not contemplated that each farm house shall become a wireless station. Though the cost of a receiver is not great, it is hardly practical now for one of each farm family to be able to take messages. But arrangements could surely be made which would give each county or even each local community a receiving station. Why cannot the offices of county agents be equipped for this service which has so great practical possibilities?

The importance of agriculture justifies the adoption of anything which will stabilize production and marketing. We cannot afford such "post mortems" as, "No, I lost money on my cattle. Struck a glutted market and the price slumped," or "practically lost my first alfalfa crop. Cut it just at the worst time. Wish I could have known it would rain." These losses are now accepted as inevitable—as part of the tribulations of farming. They can be greatly lessened. Why not furnish a service which will give the farmer early news of the markets and the most timely weather forecast possible? By telephoning his county agent he should have such advice available as "Ship today. Market seems promising," or "Delay cutting clover. Rain due tonight." It would net a great saving to the country.

CO-OPERATION

To be successful in co-operative enterprises, farmers must expect to make some sacrifices. They must contribute something to the business which they are trying to build co-operatively. Many co-operative creameries, cheese factories, and other institutions have failed because the farmers are not willing to make the sacrifices necessary to success. A person must have faith in himself and in his neighbors and in the industry in which he is engaged in order to make a success of co-operation. There must be a willingness upon the part of those who have bound themselves together for the purpose of conducting an enterprise to not only invest money, but time and effort.

It must be ever borne in mind that great business has not risen without tremendous effort. Someone is sacrificing, working, planning. It is not enough to believe in co-operation, to advocate it, to attend meetings, to make a successful co-operative institution, but there must be a contribution of materials, of effort, of thought.

Mr. A. J. McGuire, who is in full sympathy with the co-operative creameries of Minnesota, writes in The Farmer of a patron of a successful co-operative creamery, that shows what must be done in order to make the co-operative creamery a success. He says: "Up in the northern part of the state of Minnesota, there is a little co-operative creamery that has, perhaps, the smallest business of any creamery in the state. It was probably built too soon, but it has held its own and it is now in position to begin making real progress. One farmer, who was particularly anxious about the success of the creamery, was the first man to deliver cream. On the day the creamery was to open for business he was there at sunrise, and to do this he had driven 14 miles with a yoke of oxen. He believed a co-operative creamery would be a good thing for the community and during the lean years that followed he stood firmly by that belief. He has since bought a farm nearer town and oxen are no longer his means of travel, but his faith in the co-operative creamery has not changed."

No co-operative effort would fail if all the patrons of a co-operative institution would show the same devotion, had the same faith, and were as willing to make the same sacrifice as the man who carried his cream 14 miles by oxen and was at the creamery at sunrise. It must be ever borne in mind that a successful enterprise depends upon the energy and the intelligence that is put into it. Great institutions do not rise simply by thinking about them, dreaming of them—but by hard work and faithful support, well directed.

LIVE STOCK EXPORTS PROMOTED

A very practical service for live stock breeders of the United States is that performed by the Bureau of Markets in acquainting South American countries with the quality of animals here available for export. Sales amounting to about $400,000 have been completed during the past six months, largely through the work of the Bureau's representatives. The field is so promising that the work will be continued and increased in the expectation that an export trade of large proportions will be developed.

Last year two commissioners were sent to Brazil, Uraguay, Paraguay, and Argentina. Two more have recently sailed to continue the work begun, secure new contracts, and find markets for all breeds of live stock. The Bureau contemplates establishing a permanent office in South America through which an export trade may be promoted.

Not the least valuable part of the equipment of these export commissioners is a pamphlet in Spanish and Portuguese published by the Bureau. This is replete with attractive illustrations of prominent animals of the different breeds. It shows where each breed may be found in largest numbers, outlines several reasons for the superior qualities of animals bred in the United States, gives information respecting exporting, and offers the aid of government employees to prospective purchasers in locating animals and arranging for shipping.

Examination of our farm flocks and herds demonstrates the acute need for the wider use of improved breeding animals and emphasizes the fact that there is ample room in the United States for all high class breeding stock. But foreign sales are stimulating and encouraging to breeders and may tend to awaken a keener domestic appreciation of the worth of our breeding stock. The Bureau's export activity is commendable.

JUSTICE DEFEATED

With the assistance of petitions circulated at so much per name and signed by barbers, merchants, and other uninformed individuals, as petitions are usually signed, James Dorsey has had his sentence of eight years in the federal penitentiary commuted to four years by President Wilson.

Just what argument may have been presented to the President to exercise his clemency for this man who grew wealthy through his dishonest and unlawful sales of tubercular cattle, we are unable to say. It took considerable time after his guilt was known to get the necessary legal action and, with his ill gotten gains, Dorsey was able to put up a good fight though eventually found guilty and his sentence affirmed by the higher courts.

Readers of Hoard's Dairyman are familiar with all the details of the case, but they will be interested in the statement that the redoubtable Judge Kenesaw M. Landis of Chicago gave in his court in criticism of the President's action.

"Dorsey sold," said Judge Landis, "about 12,000 head of cattle a year and made about $120,000 a year. Finally he was brought to trial for his fraudulent practices and he was sentenced to eight years in the penitentiary. The sentence was affirmed by the court of appeals, but sentence was stayed a number of times. Finally, through the oversight of some one, Dorsey was placed in the penitentiary.

"When the President of the United States stops in the midst of great affairs to cut this sentence in two, I wonder what frame of mind he must have been in. I suppose Dorsey's pardon is about ready. However, I am going to watch that man and this case with great interest."

It took the government several years to get the kind of evidence it needed and it was not until early in 1918 that Dorsey was found guilty in the court of Judge Landis of using the mails to defraud. Even then he did not begin to serve his sentence until June 4, 1919, and now will be eligible to parole on October 4, 1920. No reason is given, so far as we are advised, for the action of the President.

Again, as in the case of Mr. Jelke, the wealthy oleo manufacturer, who was sentenced to prison for violation of the oleo law, justice has been defeated through executive clemency and violators of the law go practically unwhipped. We need more strength of moral fiber, and less weak-kneed sentimentality for the guilty.

ANOTHER "MILK TRIAL"

In another column appears a statement from the New Orleans Item for June 19th which, according to I. S. West, secretary of the Louisiana Dairymen's Co-operative Association, sets forth the situation existing there at that date. An indictment has been brought against three dairy farmers for "willfully, knowingly, and unlawfully conspiring to restrain trade and commerce among several states" to keep up the price of milk. To be indicted has ceased to be an innovation for dairy farmers. A court trial for seeking a fair price for their product through organization is a favorite "indoor sport". Whenever a district attorney desires to serve the "peepul" for the purpose of gaining a few city votes, he indicts a few dairymen and hauls them through the courts.

No particular harm is done except the inconvenience and unpleasantness of court proceedings thrust upon busy men. When the facts concerning the production of milk and the proportion of retail price which is paid the farmer are heard before a fair tribunal, only one verdict is heard—that of "not guilty". In some cities the indicted dairymen have never been called to trial—in others they have only been forced to listen to the political palaver of vote-seeking public officers before being freed of the charges made.

If the Attorney General of Louisiana would investigate the court findings at Cleveland, Chicago, and the Twin Cities, for example, he could save honest men the embarrassment of court publicity and the state of Louisiana the expense of trial proceedings. If there are no worse crimes for his attention than those committed by organizations seeking to gain a fair price for milk sold from the farms of Louisiana, there is no need for his services and he would serve his state well to resign at once.

Cane Seed Meal

What is the value of ground cane seed for cow feeds and what proportions would you advise feeding ground cane seed, ground barley, bran, and cottonseed meal. Bran is $3.75 per cwt., cottonseed $4.25, and barley $3.75.

La Mesa, N. M. G. A. S.

Cane seed meal is very high in its carbohydrate content and may well be compared with such feeds as barley and corn. In the ration, it may be fed as a supplement to these feeds or may replace them.

The combination of feeds which will give best results in this ration depends quite largely upon the roughages available. We presume these cows can be furnished a liberal supply of alfalfa. This is a choice roughage and will give as good results as any other single feed. It should be supplied in as large amounts as the cows will consume.

A satisfactory grain mixture may be made from 200 lbs. of ground cane seed, 200 lbs. of ground barley, 200 lbs. of bran, and 100 lbs. of cottonseed meal. High testing cows should have this mixture at the rate of one pound for each three or three

and one-half pounds of milk produced and low testing cows at the rate of one pound for each three and one-half or four pounds of milk produced.

Calf Feeding in New Zealand

HOARD'S DAIRYMAN:—The government of New Zealand appears to be somewhat in doubt of the economic wisdom of the wholesale slaughter of dairy calves now prevalent in the Dominion. This is attributable, no doubt, to the greatly enhanced values of milk and milk products. In the flourishing dairying (butter) district of Waikato, the establishment of the dried milk industry (both whole milk and skimmilk powder) has brought a slaughter that has been and is appalling. The estimate is a slaughter during a season of 30,000 to 40,000 calves. In the Taranaki district, where the greater part of the cheese made in the dominion is produced, the slaughter is as great or greater. An estimate is 40% of the calves born on the dairy farms. Hog production is dwindling rapidly in New Zealand from the same cause. The government has had some interesting experiments made in order to ascertain how calves can be reared on a minimum milk diet, and the best substitutes that can be used for this purpose. It is not with the idea of condoning niggardliness in this matter so much as to arrest the great waste of calves, that is now becoming a potential menace to the industry, that these experiments have been carried out. I was recently at Ruakura in the Waikato where the tests were tried on the State Farm. Other tests were conducted at Wereroa, in the Wellington District, which I did not visit. From the superintendent of the Government Experimental Farms, Mr. J. L. Bruce, and from Mr. A. Green, director at Ruakura, I gathered particulars, first of the tests as a whole and secondly the tests at Ruakura. They were given very readily when I explained that they were for Hoard's Dairyman.

The two government farms are situated some 300 miles apart, the first inland in a mild and humid climate, and the second in the south of the north island of New Zealand near the sea coast. In both experiments the calves were placed in fresh, clean paddocks with abundant water supply and salt licks. The utmost care was taken to insure absolute cleanliness of all feeding utensils. This last condition Mr. Bruce makes a *sine qua non*.

At Ruakura the calves were turned into paddocks down in western rye grass and red clover, sown the previous season. Mr. Bruce insists that the calf paddock should always be in new grass, well limed. It is not the general custom of this country to house cattle at any time of the year, but at Ruakura the calves were housed at night. The Wereroa experiments were conducted under practically the same conditions as those at Ruakura, and calves were bought at the local sales, just such as are usually offered with no particular breeding or anything of a pedigree. They cost but a few shillings a head.

The results of the experiments are as follows, pounds sterling being converted into dollars at the normal exchange rate of $4.88:

RUAKURA:—Sixteen calves bought and divided into 4 groups. Group 1: 8 pounds whole milk daily for two weeks, 8 ounces whole linseed, 2 ounces wheaten flour, 15 pounds skimmilk for 15 weeks. Average daily increased weight per calf, 1.61 pounds; gross weight all calves, 770 pounds. Group 2: 8 pounds whole milk daily for two weeks, 7½ ounces linseed meal, 12 ounces bean meal, 8 pounds skimmilk daily for 2 weeks, the water for remainder of 17 weeks trial period. Average daily increased weight per calf, 1.36 pounds; gross weight all calves, 650 pounds. Group 3: 8 pounds whole milk daily for two weeks, 8 ounces oat meal, 4 ounces crushed linseed, 15 pounds skimmilk. Average increased weight per calf, 1.54 pounds; gross weight all calves, 733 lbs. Group 4: 8 pounds whole milk daily for two weeks, 9 ounces crushed linseed, 15 pounds skimmilk. Average daily increased weight per calf, 1.77 pounds; gross weight all calves, 847 pounds. The cost of feed for each group was as follows: Group 1, $8.16; Group 2, $6.77; Group 3, $9.50; Group 4, $8.28. The cost of the feed is governed by local conditions.

WEREROA:—Sixteen calves bought and divided into 4 groups. Group 1: 8 pounds whole milk for two weeks, 16 pounds skimmilk for two weeks, 3 ounces linseed meal for 13 weeks. Average daily increased weight per calf, 1.51 pounds; gross weight all calves, 718 pounds. Group 2: 8 pounds whole milk for two weeks, 16 pounds skimmilk for two weeks, 1 pound crushed oats for 13 weeks. Average daily increased weight per calf, 1.71 pounds; gross weight all calves, 822 pounds. Group 3: 8 pounds whole milk for two weeks; 16 pounds skimmilk, 1 quart linseed gruel for 15 weeks. Average increased daily weight per calf, 1.61 pounds; gross weight all calves, 770 pounds. Group 4: 8½ pounds whole milk for one week, 16 pounds skimmilk for one week, 9 ounces bean meal, 6 ounces linseed meal, well cooked and served with 3 quarts warm water daily for 15 weeks. Average daily increased weight per calf, 2.31 pounds; gross weight all calves, 1,077 pounds. The cost of feed for each group was as follows: Group 1, $4.29; Group 2, $4.77; Group 3, $6.56; Group 4, $4.32.

New Zealand. GEO. OSBORNE.

Hard Seeds in Legumes

HOARD'S DAIRYMAN:—Seedsmen and seed analysts have long been puzzled to know what agricultural value to assign to what are known as "hard" seeds, varying percentage of which is found in samples of lots of legume seeds, particularly in those of alfalfa and the clovers.

The period required to obtain germination test on clovers has been fixed by seed analysts at five days. All viable seeds in any given sample should have thrown out vigorous roots and shoots in that time. Any which have not done so are either "hard" or decayed.

"Hard" seeds are those which fail to show any signs of germination at the end of the five days but which show absolutely no signs of decay. Study and experimentation have shown that these "hard" seeds are the best matured and contain the highest amount of reserve food material. Apparently the better matured they are the harder the seeds become. The harder they get the less permeable the coats become. Just how long the hard coat of one of these weeds will prevent the absorption of water, without which there can be no germination, it is impossible to tell. Apparently it depends upon the degree of hardness. A sample of alfalfa with a high percentage of "hard" seeds sent to Dr. Noble, director of the seed laboratory at Tharand, Germany, was placed under ideal conditions for germination and occasional seeds are still germinating although it has been over thirty years since the sample was placed in the germinator.

Other experimenters have shown that seeds of alfalfa and the clovers will retain their vitality for many years when buried in the soil at so great a depth that heat and air are not sufficient to bring about germination. Dr. Duvel of the United States Department of Agriculture has recently dug up such seeds which had been buried for sixteen years and found them to germinate freely. A sample of hard red clover seed was buried beside one of ordinary seed. The ordinary seed germinated 91 per cent and the hard seed 92 per cent. These seeds were buried so deeply they could not germinate but when brought to the surface after being buried so long, germinated even better than if they had been kept under favorable storage conditions above ground.

It is because it seems impossible to know just what will happen when these hard clover or alfalfa seeds are sown in the soil that seed analysts are puzzled to know what agricultural value to assign to them. It seems clear that these hard seeds are a provision of nature to perpetuate the species, a certain percentage of the seeds remaining dormant for varying periods of time.

Whether this is true or not, so far as the seed dealer and the farmer are concerned, the problem as to what value to give such seeds is still unsolved. It may be possible that action of soil acids or possible abrasion or scratching of the seed coats during the process of seeding may make some of the hard seeds permeable and hence germinable. No doubt the action of frost might crack the coats and make it possible for the seed to absorb moisture and germinate if there was enough moisture in the seed. But these hard seeds seldom contain enough moisture so that frost action can affect them. If they will not absorb moisture there will be no value in sowing the seed in the fall or very early spring in the expectation of obtaining a better germination of the seed through frost action.

In the Northern Mississippi Valley the season of 1919 was especially favorable for the complete ripening of the clover seed crop. There was plenty of moisture during the early part of the growing season followed by dry weather during the time the seed was forming and filling. Frosts came late so there was nothing to interfere with normal and complete ripening of the seeds. These conditions were especially favorable for the production of a high percentage of hard seeds, especially in the Wisconsin clover seed crops. Germination tests in the state seed laboratory show percentages of a hard seed content approximate 20% on the average and in some cases reaching 42%.

When the seed dealer knows that the hard seeds are among the best developed and contain the highest amount of reserve plant food it seems to him an injustice to require him to label this seed with the actual germination tests which will necessarily be low. In other words, if the sample tested shows an actual germination of 78% and 22% of the seed remain "hard" the seed must be labeled with a germination of 78%, this in spite of the fact that when the hard seeds do germinate they will produce the best matured, most vigorous plants of any seed in the sample.

To the user of the seed, however, the proper labeling of the seed is extremely important. If the hard clover seeds lie dormant in the soil for more than two years, which investigation has shown to be more than probable, then the hard seeds are of no value to the Wisconsin farmers who almost universally turn down their grass land after two years of hay production.

Even were these seeds to grow after being three weeks or a month in the soil, the other clover plants, the nurse crop of grain and weeds, would smother the young plant and prevent its development. It seems, therefore, that until further investigational work, under conditions closely approximating farm practice, has been done, hard seeds in clover and other legume seeds must be considered of little agricultural value.

A. L. STONE.

Wisconsin College of Agriculture.

[Editor's Notes:—In reply to our inquiry as to whether the trouble of hard seeds, particularly clover and alfalfa, cannot be overcome by scarifying, Professor Stone states that it would accomplish this purpose. "But," he says, "the article was written very largely for the farmers who produce and make use of their own seed or sell to their neighbors. Scarifying would undoubtedly be profitable where the quantity of seed is sufficiently large to warrant it and where facilities for scarification are available without making the cost of the seed prohibitive."]

Next Winter's Ration

Kindly give your opinion as to the most economical feeds to purchase for the coming winter. The roughage will consist of a good supply of corn silage and clover and alfalfa hay, in about equal amounts, but in a limited quantity. We have plenty of oats on hand, also three tons of oil meal purchased at $67 per ton. Our herd is of heavy producing Holsteins, milking forty to sixty pounds daily.

Oconomowoc, Wis. M. F. H.

It is impossible to predict winter prices of feeds accurately. In general, it has proved to be the best practice to purchase concentrates about this season each year. Some unusual factors influence present markets, however, and may operate to lower prices later in the year. Because of these uncertainties, we cannot calculate the quotations which may be made later on concentrates.

This inquirer is following what Hoard's Dairyman considers to be the only practice consistent with good dairy farming, namely, that of raising as large a part of his dairy ration as possible and furnishing his cows, as a basis for their ration, liberal amounts of corn silage and a legume hay. He does well to feed his clover and alfalfa as liberally as these hays will be consumed. If the supply is not sufficient to last throughout the winter, more should be purchased. These hays furnish nutrients at a lower cost than they can be purchased in concentrates. Holsteins should handle around 40 lbs. of silage per day economically.

In addition to this, the heavier producing cows, that is, any cow producing more than about 30 lbs. of milk per day, will pay for a supply of concentrates. With the oats and oil meal, a high carbohydrate feed such as corn, hominy, or barley is needed. A good mixture may be made from 400 lbs. of ground barley, ground corn, or hominy; 200 lbs. of ground oats; and 100 lbs. of oil meal, this to be fed at the rate of one pound for each three and one-half or four pounds of milk produced.

If our correspondent can secure a good price on cottonseed meal, we advise him to plan to use this feed, either with his oil meal or to replace it entirely with some cows. In the herd will be some animals for which such a mixture as recommended will be too laxative through combining silage, alfalfa, and oil meal. Such cows should have cottonseed meal instead of oil meal.

Cow Testing Associations

RECORDS, PRICES OF FEEDS, FAT, AND MILK

Following is the summary of reports received during the week and up to the time of going to press of this issue:

Association Notes

Canaan, Connecticut:—A pure-bred bull was placed at the head of a grade herd during June. Market milk testing 3% sold for $2.94 per cwt. and 4c per point above this test. Feeds are rated as follows: Mixed hay, $30 per ton; cottonseed meal, $84; Schumacher, $72; gluten, $84; mixed feed, $69; oil meal, $68.

Jackson County, Kansas:—A quarter interest in a $5,000 bull was purchased by D. Coleman and Sons at St. Paul to head their Holstein herd. A registered bull calf and four heifers have been sold by one member and two others have each sold a bull calf. Another member has purchased three more registered cows to add to his Jersey herd. A Jersey cow club for boys and girls was organized with 14 members enrolled. A registered Jersey of a value not to exceed $350 is given to each member on proper security. Each cow will be tested for one year, either semi-officially or in association work. In June 3.5% milk sold for $2.90 per cwt. The creamery paid 54c per lb. for fat and butter retailed for 50c per lb. Corn chop sold for $3.60 per cwt.; bran, $3.00; oil meal, $4.50.

Mondovi, Wisconsin:—Twelve head of grade and scrub heifers and cows were sold in June, and three pure-bred Holstein cows, three pure-bred heifers, one pure-bred Holstein bull calf, five pure-bred Jersey cows, and one Jersey calf were bought into the association. The creamery paid 64c per lb. for fat in June and the cheese factory paid 65c in May. Milk retails for 10c per quart.

Whitewater, Wisconsin:—Nine unprofitable cows were sold during June. This association is one hundred per cent free from scrub sires. Pasture is in fine condition. June market milk testing 3.5% sold for $2.75 per cwt. and 4c per point was paid for fat above this test. The condensery paid 78c per lb. for fat and the creamery paid 76c per lb. Milk retails for 13c per quart, butter for 65c per lb., and cheese for 30c per lb. Oil meal is rated at $66 per ton; bran, $53; ground oats, $60; corn and cob meal, $58; silage, $7; hay, $40.

Wood County, No. 2, Wisconsin:—The average of this association for June is 817 lbs. milk, 28.57 lbs. fat, with an average test of 3.5%. A census of the sires in the association shows that 30 pure-bred and 15 grade sires are being used.

Pioneer, Minnesota:—June market milk sold for $4.83 per cwt. The creamery paid 72c per lb. for fat and milk retailed for 13c per quart. Pasture is rated at $2.00 per month, bran at $54 per ton, and oil meal at $70.

Monona—Farmersburg, Iowa:—Two carloads of cottonseed meal were bought at a saving of $20 per ton.

Claremont and Lebanon, New Hampshire:—One unprofitable cow has been disposed of and three unprofitable cows sold at good prices. One excellent pure-bred bull was purchased by a member. Both associations are using only pure-bred sires. Great efforts were made by the farm bureau to promote the keeping of pure-bred stock and some good results have already been obtained. One member recently installed a milking machine and is well satisfied with results. Three other members are installing light plants. Very little haying has been done so far, weather conditions being unfavorable. June market milk sold for $3.50 per cwt., 3.7% test required and 4c paid for each point above. The creamery paid 75c per lb. for fat, milk retailed for 14c, and butter for 70c. Feed prices are: Bran, $67 per ton; cottonseed meal, $92; linseed meal, $80; corn meal, $82; ground oats, $75; ready mixed rations, $83 to $87; Stork Feed, $80.

Western Broome No. 2, New York:—A meeting of the association was held June 4th for the purpose of closer co-operation, to become better acquainted and to organize for the following year. Pasture became short during the month and many were forced to feed grain and hay to their cows. Market milk testing 3% sold for $2.83 per cwt. in June, 4c being paid for each point above. Milk retailed for 13c per quart, butter for 60c per lb., and cheese for 32c per lb. Gluten is rated at $78 per ton; hominy, $82; cottonseed meal, $80; wheat bran, $70; hay, $40 delivered.

Butler Road, Ohio:—Four unprofitable cows were sold during June and ten pure-breds bought. The association is improving very fast and meeting with success. June market milk testing 3.5% sold for $3 per cwt. and 5c per point above this test. The condensery paid 54c per lb. for butterfat. Feed prices are: Larro Feed, $79 per ton; oats, $32; corn, $50; oil meal, $80; cottonseed meal, $80.

Geauga County, Ohio:—In June market milk sold for $3 per cwt., a test of 3.5% required. Unicorn is rated at $3.75 per cwt.; Union Grains, $3.80; hominy, $3.65; gluten, $3.80; bran, $2.65; oil meal, $3.80.

Western Allegan County, Michigan:—Since the association started five months ago, eight unprofitable cows have been sold. A few separators have been adjusted to do more efficient work. June market milk testing 3.5% sold for $2.75 per cwt., 4c to 6c per point above being paid. The creamery paid 58c per lb. for butterfat and milk retailed at 12c per quart. Cottonseed meal sold for $83 per ton; Unicorn, $80; Larro, $80; bran, $63; corn and oats, $90; hay, $25; oil meal, $85; middlings, $65; silage, $8.

Dodge County Central, Minnesota:—During June there were 438 cows tested, the highest cow producing 75.68 lbs. fat in 2,220 lbs. milk. The high herd average was 43.99 lbs. fat.

Douglas County, Colorado:—This association started work June 10th with twenty-four members. Mr. Sherman, an experienced tester from New York and Illinois, is conducting the work and reports eighteen members using pure-bred sires. Every member has a silo and five are using milking machines.

Otero County, Colorado:—G. M. Dickson is the owner of the high herd of ten cows in this association. These cows averaged 816 lbs. milk and 30.3 lbs. butterfat for the month of June. R. K. Huff owns the high cow which produced 1,287 lbs. milk and 42.74 lbs. butterfat. Four new cement silos have been constructed. Pasture is good and the average feed cost per 100 lbs. milk is 95c. The association is being reorganized for another year.

Platteville, Boulder, & St. Vrain Valleys, Colorado:—This association includes part of the old Boulder Association (discontinued last month) and Platteville, Ft. Lupton, and Brighton districts. Thirty per cent of the cows in the association are pure-breds. Forty-eight cows produced over 40 lbs. butterfat, twenty-two over 50 lbs., and eight over 60 lbs. H. S. Andrews is owner of the high cow, a Holstein which produced 1,626 lbs. milk and 71.5 lbs. fat for the month. Mr. Vollmar owns the high herd. His twelve cows averaged 993.8 lbs. milk and 47.5 lbs. fat. This record is surpassed by only one herd in the state.

Colorado gives the following "Cow Tester's Formula" as "a fine way to kill a dairy enterprise": "Use oleo and nut butters on your table daily. Creamery butter is too expensive for farmers and dairymen to use. Still you wish to see the city families pay the prices and consume more dairy products. Don't allow your children and your family to drink your own product—milk. Instead use tea and coffee. This helps the southern countries to get rich."

Starrucca, Pa.:—Three per cent market milk sold for $2.83 per cwt. in June, 4c being paid for each point above this test. Milk retails for 9c per quart, butter for 65c per lb., and cheese for 45c. Gluten sells for $3.75 per cwt. This month completed the yearly records of the Starrucca Association. The leading cow for the year is owned by W. W. Utter. This cow produced 13,930 lbs. milk, 473.4 lbs. fat, at a net profit of $303.47. The second cow, owned by A. W. Downton, made 12,867 lbs. milk, 471.7 lbs. fat, at a net profit of $265.32.

New Orleans Milk Producers Indicted

The following is a statement sent by I. S. West, Secretary of the Louisiana Dairymen's Co-operative Association. It is taken from the New Orleans Item for June 19:

An indictment charging three prominent dairymen of Louisiana with conspiracy to keep up the price of milk was returned Saturday by the federal grand jury.

They are I. S. West of Baton Rouge, secretary of the Louisiana Dairymen's Association, Peter Fabacher of Baton Rouge, and J. P. Wallace of Kentwood.

They are charged with "wilfully", knowingly, and unlawfully conspiring to restrain trade and commerce among several states" to keep up the price of milk.

Two States Involved

The alleged offense is declared to have taken place in Louisiana and Mississippi, which would make it interstate, and therefore, a federal matter.

A few months ago, Attorney General of Louisiana investigated reported action of Mr. West and other dairymen.

The present charge is a development of the recent milk fight. In April of this year, a large distributor of milk announced an eight-cent reduction per gallon in the price of milk he would give the farmers. This would have put milk two cents a quart cheaper.

Dairymen said they couldn't produce at that price. A number of meetings were held, at which production costs were discussed. Mr. West and the others named in the indictment are charged with developing a conspiracy at those meetings to refuse to sell milk at the reduced figure.

Dairymen did stop shipping, but Mr. West contended at the time it was individual action on their part following the discussions of the costs of production. It was reported that a number of farmers sold their cattle to the butchers and turned them out to grass, rather than sell at the reduced price, which they contended was a money-loser to them.

In the milk fight that followed, the local distributor imported milk from Chicago. The Louisiana dairymen were beaten.

The only reduction in the price of milk in New Orleans this year has been that two cents which was sliced off the farmer's pay check. The extra penny which the local distributing agent in question added for his own account when the farmers were given an increase the year before, is still on.

Michigan Farmers Round-up

Plans are completed for the second annual farmers' round-up at the Chatham, Mich., Experimental Station August 11th and 12th. This gives promise of being the greatest agricultural meeting yet held in the Upper Peninsula. A great many farmers are expected to attend from all counties in the Upper Peninsula and all agricultural organizations are co-operating to this end.

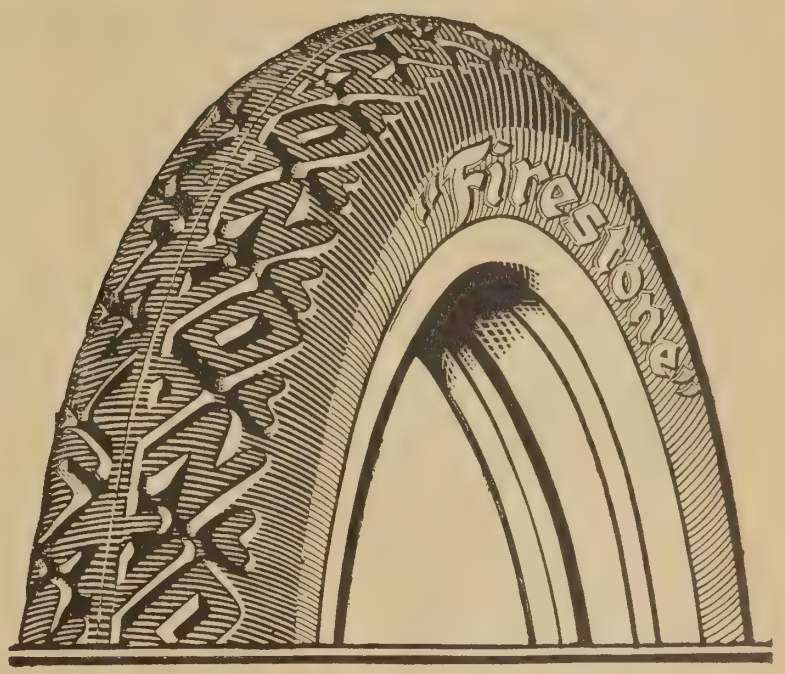
The state club leaders will have a two days' summer camp. Home demonstration agents and girls' club leaders will have a special two days program. Alger County is making effective entertainment preparations. An 800-lb. ox has been ordered for a barbecue. There will be stump blasting, dairy, and hog and sheep demonstrations. President F. S. Hedzie, Dean R. S. Shaw and Director R. J. Baldwin will speak.

Michigan. D. L. McMillan.

Westover Appointed Guernsey Representative in West

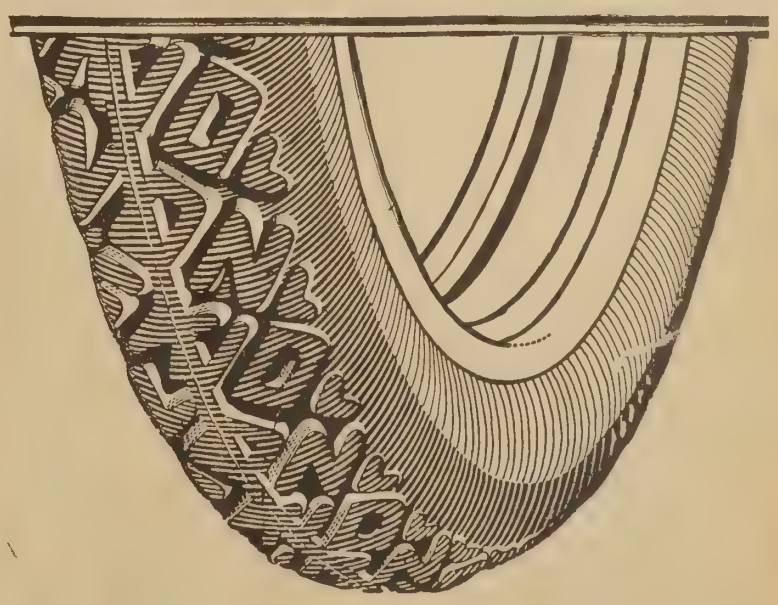
Mr. E. L. Westover, for several years in charge of dairy extension work for the Oregon Agricultural College, has accepted the position of fieldman for the Pacific Northwest for the American Guernsey Cattle Club. He begins his new work August 1.

This field appointment is the first made in accordance with the extension plans laid by the Club at its last annual meeting. Mr. Westover, already familiar with the dairy situation in the Northwest, will devote his efforts to developing Guernsey breeding communities.



Firestone

Alone in the tire field—the Firestone 3½ takes its place beside the half dozen products of universal use which manufacturing genius has made standard.



Built in a specialized factory—by experts—with all the economy of concentrated production.

What the bulk of the people accept as the standard of value is right.

You owners of small cars can forget tire details—you need not bother with methods, features, or guarantees. Call for the Firestone 3½.

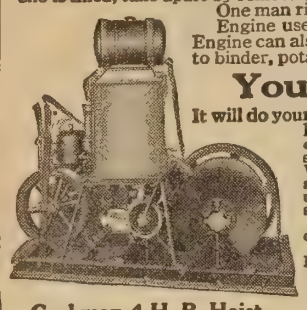
One-Third MORE in Your Silo

Saves Time
Saves Silage
One-third More Capacity

You don't need to rebuild your silo to increase its capacity—or to build another. You can increase the capacity of your present silo one-third, fill it with less time, and prevent spoilt silage with a



Cushman Silage Packer

Tamping silage packs it irregularly, leaving air pockets to cause spoilt silage. The Cushman Silage Packer packs the ensilage evenly and thoroughly throughout the entire silo, pressing it down and against the walls so that the air cannot get through, and doing the job so much better than tamping that your silo will hold one-third more. You can complete the job at one time, without waiting for the ensilage to settle—**the Cushman Packer settles it.**

Not an experiment—but used for years and recommended by agricultural experiment stations. The packer is put into the silo when you begin to fill, and there quickly assembled. After silo is filled, take apart by removing a few bolts and lower over side of silo by rope and pulley.

One man riding in seat controls engine speed and distributing spout.

Engine used is the well known Cushman 4-H. P., weighing only 190 lbs. Engine can also be used for all other farm work, as well as being attached to binder, potato digger, etc., to save a team.

Cushman 4 H. P. Hoist

You Need This 4-H. P. Hoist

It will do your heavy lifting. It will pay for itself in one season and last a lifetime. Just the hoist for handling the hay fork, lifting ensilage out of pit silo, unloading hay and grain, pulling up hog or steer when butchering, for excavating or building, or for handling ice. Will put 30 per cent more hay on the stack than can be done with team and driver. Easy to hold load by applying brake lever. No need to use the brake on return, for automatic governor clutch prevents overspeeding. Load cannot drop. If engine stops, the load stops.

Weight of engine and hoist, assembled complete on steel skids, only 580 lbs. Trucks can be supplied if desired.

Write for circular, stating whether interested in Silage Packer, Hoist or Light-Weight Engines. (343)

Old Milk Cans and Cheese Hoops Made New

Trial Offer

Save 2/3!

Send 1 to 3 rusty, dented, leaky milk cans or cheese hops to be re-built on special trial offer. We will remove dents, solder leaks, repair or replace handles and retin cans or hoops like new at clear saving to you of two-thirds price of new cans or hoops. If not pleased and satisfied pay nothing.

New Secret Process

99.99% pure tin coating—no lead used. Free from streaks or spots. **Guaranteed to outlast original finish.** Thousands of farmers, creameries, dairies now protect cans and hoops against rust by this process at amazing savings. Write for details today.

Acme Galvanizing & Tinning Co.
860 Reynolds St., Milwaukee, Wis.

The secret Acme process and re-building is endorsed by highest dairy authorities and dairy publications

Better Butter Prices

Customers willingly pay *more* for butter they know is *perfect*, just as first churned.

Pioneer Parchment Paper keeps it clean and sweet. Makes butter *worth* more, and *sell* for more. The cost of Parchment Paper is small. The extra profit more than justifies it.

Our free booklet, "Better Butter" is your money-maker. Send for it.

Promoting Pure-bred Holsteins at Fort Scott

(Continued from page 35)

the Chamber of Commerce in organizing the company.

Farmers who keep the cows secure all the milk and butter that the cows produce and one-half the value of the offspring. The male calves are to be sold before they are a year old and the money divided. The females are kept for a period of five years at the expiration of which time a big sale is held. The money received from the offspring is to be divided between each farmer and the company, and the company dissolved.

Farmers are required to purchase stock in the company to the value of $100 for each cow they receive, and are urged to buy as much stock as they can finance. On this stock the farmers participate in the dividends of the company, the same as any other stockholder. The stock not purchased by the dairymen taking cows is sold to local farmers and business men. About one-half the money has been subscribed in the country and one-half in town.

The company owns high quality bulls which are used to breed their cows. The animals are cared for by a keeper employed by the association, who is provided with a motor truck and upon request of the farmer belonging to the company, the keeper transports a bull to their farm and breeds the cow. Far Oak Sir Homestead Rue, a son of Piebe Laura Homestead King, was recently purchased from the Minnesota Holstein Company as one of the herd sires. The bulls to be used by the company are all yearly record animals and all the females are to be tested on a yearly record basis some time during the five-year period.

This organization gives the small dairyman a splendid opportunity to breed pure-bred cows. These animals in general will produce more milk or butter and return better profits than would a like number of the grade cows common in this community, and half of the offspring from the pure-bred cows will be of greater value than all the offspring from the grade cows. As the cows remain the property of the company, it relieves the individual from much of the risk incident to purchasing pure-bred cattle. The organization by its size and nature enables the individual to sell surplus stock and bull calves to good advantage. The company gives the small breeder an opportunity to breed his cows to a sire of quality that hitherto has only been available to the man with a large herd. It places the man with a few pure-bred cows on a level with the large breeder.

MR. T. A. TRULL, COW TESTER FOR THE BOURBON COUNTY COW TESTING ASSOCIATION

Bourbon County, Kansas, of which Fort Scott is the county seat, has been working toward the development of the dairy community for the past four years. At that time some of the leaders in the community found that the continuous cropping system followed by many farmers, in which corn or the sorghums had been grown for years, was leading to agricultural bankruptcy; they found that crop yields were decreasing and the land was getting poorer. They looked around, got expert advice, considered the few local examples available, and started out to build a dairy community.

The distribution of the pure-bred cattle was one of the events in the work that gives evidence as to the progress that is being made. In the past four years a large condensery has been built at Fort Scott; the building of hard surfaced roads to facilitate the transportation of milk has been pushed rapidly; large numbers of Holsteins have been introduced; and the use of pure-bred Holstein bulls on the better grade Shorthorn cows is assisting in developing profitable dairy cattle. A cow testing association has completed one year's work and started on its second year, and another association is to be organized shortly.

Perhaps the most noticeable result of this work is in the spirit of the community. A feeling of doubt and lack of confidence in the future of this county has given way to a spirit of confidence in the community and faith in the future.

Red River Guernseys

The annual picnic and sale of the Red River Valley Guernesy Breeders' Association, Minnesota, was held on June 8th at the Burr Oak Farm, owned by Albert Johnson. Harry Woolson is president and Leonard Houske is secretary and treasurer. These officials have worked hard to make the meeting a success and judging from the attendance and prices their efforts were well awarded.

The prices of the animals sold ranged from $115 to $350, which is a very good record for the first sale of Guernseys held in Pennington County.

The Guernsey breeders of Pennington County, Minnesota, are doing much to boost the Guernsey breed in the Northwest by showing a car load of their finest animals on the show circuit in this part of the state. This car load was loaded in Thief River Falls, June 29th. After making this circuit the car will return to Thief River Falls in time for the Pennington County Fair, August 4, 5, and 6.

The herds are appropriately and attractively labeled with signs of the individual owners and one large sign advertising Pennington as the Guernsey center of the Northwest, coming from a locality with more accredited herds than any other county in the United States.

Idaho Wants Testers

HOARD'S DAIRYMAN:—The Extension of the University of Idaho is in need of official testers and cow testing association supervisors. The salary paid is $75 a month for the association work and $3 a day for the official testing work. We want men who have had experience in dairying and who can make the Babcock test for milk. The expenses of the testers are all paid by the associations and board and room is furnished.

Boise, Idaho. F. R. CAMMACH,
Field Dairyman.

The Power You Turn into Light

It takes power or "energy" to produce light. With old-fashioned lighting it took *human* energy. The more light you had, the harder you *worked* for it. The great advantage of electric light is that it requires mechanical instead of human energy and, when NATIONAL MAZDA lamps are used, it takes only a little even of mechanical power!

NATIONAL MAZDA lamps are so economical, use so little electricity, and produce such brilliant, eye-helping illumination that they are used as standard equipment with fully nine-tenths of the lighting plants now being installed.

You will do well to specify NATIONAL MAZDA when you buy new lamps. They may be obtained from the man who sold you your plant or from the NATIONAL MAZDA agent where you see the Blue Carton displayed.

NATIONAL LAMP WORKS *of* General Electric Company
72 Nela Park, Cleveland, Ohio

Each of these labels represents a Division of National Lamp Works equipped to give a complete lighting service

NATIONAL MAZDA LAMPS

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Chronic Cough

I recently bought a Jersey and heifer calf. The calf was dropped on April 28th, and is in the pink of condition. The cow seems to have a cough, sometimes she will go a week without coughing, then she will cough continually for a few days and stop. I noticed recently at times her nose seems to run, but this very little and can't be noticed unless you pay particular attention to it. She eats heartily and is a heavy milker, though this is her first calf. In spite of this cough she doesn't seem to be on the decline and on the contrary she seems to be getting in better condition as time goes on. I am at a loss to understand just what can cause this cough. She has had it for some time, and judging from all appearances and condition she is far from looking like a tubercular cow.

Hammond, La. A Subscriber.

Tuberculosis in all probability is the cause of the cough and other symptoms described. In all such cases the first step should be to have the tuberculin test applied by a qualified veterinarian. It is the only way of determining whether or not the disease is present. We should advise testing by the intradermal method at this time of the year. Write again if necessary after the test has been applied.

Abortion

Please tell me best method of preventing and curing contagious abortion. Is vaccination for abortion successful?

Frederick, Wis. J. B.

Vaccination, thus far, has not proved satisfactory but it is along that line that a successful treatment eventually will be achieved. Isolate affected cows and have them disinfected by a veterinarian. Also cleanse, disinfect, and whitewash the stable under his supervision. Before breeding any cow or heifer, flush out her vagina every other day for 2 or 3 weeks with lukewarm boiled water containing 30 grains of permanganate of potash to the gallon and continue the injections for 3 weeks after service. Disinfect the bull with a like solution before and after each service.

Milklessness

Upon the farm that I am operating, there is a young Jersey cow that has always been giving a good flow of milk when she was fresh. She became fresh about two months ago, and is in a good pasture and is practically dried up, or gives a very small mess of milk. She is an unusually good fresh cow for giving milk and I thought possibly that you could suggest something that could be done to restore the normal flow of milk.

The cow did not have as much silage as usual last winter but was fed largely on clover hay, and remained in good flesh during the winter and I do not understand why she should fall off on her milk so soon after freshening.

I have a mare, whose colt died soon after birth, and wish to know whether anything should be fed to the mare or anything done with her to prevent the milk from affecting her system.

Jim Falls, Wis. F. F. A.

A chill or shock at calving time often leads to such suppression of milk. Allowing a calf to nurse may reestablish milk secretion, but not if garget (mammitis) happens to be the cause and it is a common one.

A little milk should have been stripped away at increasing intervals and warm camphorated oil or vinegar and water applied to the udder twice a day until milk secretion ceased; the mare meanwhile being allowed dry feed.

Ducks Dying

I have a flock of ducks which are all pretty big. They all have been healthy until the past week and one by one they have been dropping off. They will fall over on their backs and cannot get up and when I help them up they fall over again. It seems they have no control of their legs; they will not eat and soon die. If you could inform me what is the cause and also what to do for them, it will be greatly appreciated.

Townsend, Wis. H. B.

It would be impossible to confidently diagnosis the disease that is killing your ducks, as a post mortem examination would be necessary to a correct determination. It would be well, therefore, to open one of the ducks and if you then cannot decide what is the matter, arrange to send one of them to the state agricultural experiment station, veterinary department, for examination. Meanwhile, give the ducks a change of yard and feed. It seems likely that they have taken some poison or other deleterious matter that has caused fatal derangement of the digestive organs.

Abortion

We have contagious abortion in the herd and have been fighting it for six months or more. Part of the time through a local veterinarian and part of the time with the carbolic acid treatment. I am not getting results except it seems that the lysol treatment prevents getting the cows in calf. Do you think it would have that effect? Is there any cure for it? I can not separate the infected cows from the well ones. We have a small place with only one barn and one small pasture. I have got to stamp out the disease or quit the business. Which shall I do?

Illinois. H. R. S.

As often stated here, there is no specific remedy for the contagious abortion disease, which also causes barrenness or shy breeding, but it may die out in 18 months to 2 years if you can combat it properly by disinfecting methods. At least separate the affected from the unaffected cows and heifers by a partition in the stable and fence in the field.

Have the veterinarian treat the womb and ovaries of each affected cow according to modern principles. Mere flushing out of the vagina will not suffice. That, however, should be done every other day for two or three weeks before again breeding a treated, affected cow, or a non-affected heifer. For flushing purposes, use a solution of 30 grains of permanganate of potash and 1 gallon of lukewarm boiled water. Use a similar solution to flush out the sheath of the bull before and after each service. The veterinarian also should instruct you how to properly cleanse, disinfect, and whitewash the stable.

A mixture of 1 part of compound cresol solution in 30 parts of water, or 5 ounces of formaldehyde in 1 gallon of water will serve well for disinfecting of floors, gutters, and other parts of the stable. The carbolic acid, if given at all, should be given from the end of the second month to the end of the seventh month of pregnancy in the case of heifers and throughout pregnancy in the case of affected cows. It has not, however, proved successful on trial at the experiment stations, but many breeders believe it well worth trying. Write to the experiment station of your state and Department of Agriculture, Washington, D. C., for bulletins on abortion.

Georgia Jersey Jubilee

The Georgia Jersey Jubilee and the first consignment sale of the Georgia Jersey Cattle Club held July 5 was a success in every way.

The Jerseys were the best ever offered for sale in Georgia and the quality was appreciated as the 42 head sold for $17,965, an average of $428. This is the highest average of any Jersey sale ever held in the southeastern states.

Fully fifteen hundred people were there to enjoy the program, the barbecue, and watermelon cutting. It was a Jersey day and will always be a bright spot in Jersey history.

Roscoe H. Luke, of Thomasville, delivered the address of welcome and Professor Milton P. Jarnagin of the Georgia State College of Agriculture responded. Mr. Frank C. Baldwin, proprietor of Snowden Farm, Virginia, represented the American Jersey Cattle Club and gave an instructive talk in which he outlined practices which his experience as a breeder has taught him are necessary for success. He emphasized the necessity of breeding and selecting for type as well as for production. He urged each beginner to choose a family and stick to it. The necessity for breeders working together was clearly pointed out.

As soon as the program was over and on schedule time the barbecue and watermelon cutting was announced. The people of Thomasville had expected a large crowd and there was food enough and to spare.

At the beginning of the sale the secretary of the Georgia Jersey Cattle Club spoke for a few minutes on the things the club is doing and how it can help the breeder. He asked all who wanted to join to do so. They came so fast that he had to have help in recording them. Twenty-five joined, each paying in his ten dollars. The club is not talking co-operation; its members are busy co-operating.

The cattle were, on the whole, in good condition. The breeders who had fitted their offerings most carefully were well repaid for it. Forty-two head sold for $17,940, an average of $427.14 each. No animal sold for less than $200.

There were buyers from Georgia, Florida, Alabama, and Texas.

Following is a list of animals selling for $400 or above and their purchasers:

Dr. J. C. Woolridge, Georgia	
Betsey's Oxford You'll Do	$825
Thos. W. Holloway, Georgia	
Majesty's Egyptian Lass	$900
Thomasville Live Stock Co., Georgia	
Tycoons Oxford Triumph	$1,000
W. A. Watt, Georgia	
Fannie Steel 2d	$725
A. M. Cope, Alabama	
Egyptian Dulcet	$500
P. J. McCollum, Georgia	
Eminent's Louise Geier	$425
Eminent's Golden Della	430
Dr. T. R. Crovatte, Georgia	
Rayol Duchess of St. L.	$425
W. H. Emmet, Georgia	
Rosa Gold's Jewell	$460
J. D. Holman, Alabama	
Viola's Oxford Warder Lady	$685
Elsie's Sister of H. S. F.	425
L. J. McPhaul, Georgia	
Raleigh's Mabelle of B.	$425
P. K. Yonge, Florida	
Raleigh's Elena of Brookhill	$400
Eminent's Dainty Lady	430
Eminent's Juliet Raleigh	600
C. M. Shackelford, Georgia	
Eminent's Little Duchess	$400
C. W. Cochran & Bro., Georgia	
Raleigh's Clothilde Dame	$460
Tippin's Fairy Queen	700
Neel Bros., Georgia	
Royal Lassie	$425
Imp. Alice Verbena	750

Georgia. W. H. HOWELL.

DON'T PUT OFF

Seeing your friends and having them join in for a club of subscribers.

Pure-bred Holstein Females

In order to make room for fall calves, we are offering a choice lot of heifers from three months to two years old, some bred to freshen this fall and winter, in excellent condition, well grown and good individuals. Popular A. R. O. breeding and sold on a money back guarantee, priced reasonable for quick sale.

Blumecrest Farm, Maple Lake, Wright Co., Minn.

Silos At Half Price

I must clear my present warehouse before winter. About 200 silos left, which I will sell at half price as long as they last. Silos are well known make, new, built of genuine Clear Oregon Fir, and absolutely first class in every way. You have as good a chance at these as anyone else if you get your order in before they are gone. No partiality shown big buyers. Everybody treated fairly. Orders filled in order of their receipt.

M. L. SMITH, *Manufacturer's Agent*

118 Flood Building

MEADVILLE, PENNSYLVANIA

Sequel's Glenwood of Linwood 41767

Sire, Imp. Clara's Sequel 29414, sire of 30 A. R. daughters averaging 500 lbs. fat. Dam, Ideal of Alfalfa Farms 40750. She has three A. R. records: 452 lbs. class G, 740 lbs. class A, 690 lbs. class AA. I am offering the following bulls by the above sire. Their dams have large records and are sired by Langwater Frenchman, Langwater Frederick, and Governor of the Chene:

Eugene of Linwood 7 months, dam 752 lbs. class AA class leader
Edgar of Linwood 11 months, dam 540 lbs. class B
Edward of Linwood 11 months, dam 421 lbs. class G
Emery of Linwood 11 months, dam 514 lbs. class A
Edwin of Linwood 10 months, dam approximately 590 lbs. fat class FF
Elmer of Linwood 8 months, dam 485 lbs. class G
Ernest of Linwood 8 months, dam 566 lbs. class B

Sale List Homer F. Rundell, Livingston, Wis.

August 11th

Public Sale

August 11th

We are offering at public sale August 11th at 10 A. M. at the Jean Du Luth Farm, Duluth, 80 of our best Red Polls. We doubt if a better string of milking Red Polls was ever offered at public sale in any herd. We are selling our senior herd bulls, also heifers and young bulls by them. Don't forget the date. Send for catalog.

Jean Du Luth Farms, Duluth, Minnesota.

5-10 Well Bred Heifers

Several Good Young Bulls

are what we are offering just now. The heifers are registered two-year-olds bred to freshen this fall—several are daughters of Sir Ormsby Homestead Butter Boy, a 35-lb. bull of Homestead Jr. De Kol breeding.

The young bulls up to 9 months old are from A. R. O. dams and several are by "Butter Boy". One is by King Bess Burke Ormsby, a 42-lb. grandson of S. P. O. M. and Spring Brook Bess Burke.

They are priced to sell. Write or, better still, come and see them.

ANDREW FRANK, FOX LAKE, WIS.

The 25th Sale of the Pure-bred Live Stock Sales Co.

of Brattleboro, Vermont

On Tuesday and Wednesday AUGUST 3rd and 4th, 1920

Will consist of upwards of 100 head of Holstein-Friesian cattle of all ages and both sexes.

Take a few days off and see the historical Deerfield and Connecticut Valley.

The grandeur of the Green Mountains beckons the tourist from far and wide.

Edgemoor Guernseys Average $962

THE sale of 62 Edgemoor Farm Guernseys at Waukesha, Wisconsin, July 22, brought a total of $59,695, an average of $962.82. Imp. Itchen May King and 29 of his daughters and granddaughters featured the auction, the former going to F. E. Fox and Goodhand Kingston & Son of Wisconsin for the top price of the day, $6,100, with Wm. Jones and McKerrow Farms runners-up. The twelve daughters returned an average of $1,012.50. Twenty animals out of the 62 brought $1,000 or more.

Imp. Donnington Goldie 5th, first prize cow at National Dairy Show in 1917 and 1919 and third cow in Class E with a record of 796.52 lbs. fat was highest priced female. F. J. Reuping of Wisconsin made the last bid of $5,200, J. L. Hope of New Jersey contending with a bid of $5,100. This is the highest valuation yet placed on a Guernsey cow in the Waukesha sale pavilion. The second female in price was ten-year-old Imp. Mildred II of Les Godaines. She has a record of 702.24 lbs. fat made as a five-year-old and was first prize cow at the Panama-Pacific Exposition and first prize Advanced Registry cow at the 1917 and 1919 National Dairy Shows. Jones & McKerrow, Wisconsin, are her new owners.

Wisconsin and Minnesota bought the offering, the former taking 47, the latter 14, the only Edgemoor Guernsey going outside these two states being purchased by C. L. Hill of Wisconsin for A. C. Haskell of Georgia. Two Wisconsin show herds took the greatest number of good ones, building and filling out their entries for the fall shows. Goodhand Kingston & Sons paid $2,200 for a three-year-old daughter of Imp. Itchen May King, besides taking a half interest in the old sire himself. Jones & McKerrow took four at $1,000 or more, including the ten-year-old cow and a $2,000 senior yearling daughter of Royal Rose King of Edgemoor. Radisson Farm and A. C. Loring of Minnesota were the heaviest Minnesota buyers.

This sale was a consignment from the Edgemoor herd of California, offered because of shortage of labor. It was shipped to Waukesha and sold under the management of F. E. Fox. Arthur Klussendorf had charge of it in its fitting and was responsible for the excellent condition in which these animals went on the auction block. Some inferior individuals were offered but the run of the sale ranked it as one of the best Guernsey auctions yet held. It proved a highly favorable advertisement for this great California herd.

Benjamin, Love, and Jones sold, with F. E. Fox in the box.

The following lists all animals selling for $750 or more, with their buyers:

Goodhand Kingston & Sons, Wisconsin	
Itchen Queen of Edgemoor	$2,200
Lillian of Edgemoor	975
Mary's Sumac of Edgemoor	1,000
Jones & McKerrow, Wisconsin	
Eidelweiss of Edgemoor	$2,000
Spring Maid of Edgemoor	1,350
Imp. Mildred II of Les Godaines	2,700
Century Girl of Edgemoor	1,000
H. A. Kuhtz, Wisconsin	
Imp. Grade Fort Pride III	$1,000
Fedora of Edgemoor	1,325
Fox & Kingston, Wisconsin	
Imp. Itchen May King	$6100
Radisson Farm, Minnesota	
Dolly Varden of Edgemoor	$1,000
Gloriana of Edgemoor	850
Renown of Edgemoor	1150
R. K. Overton & Son, Wisconsin	
Caprice of Edgemoor	$1,275
F. W. Brandt Wisconsin	
Rainbow Girl of Edgemoor	$1,250
P. H. & C. H. Kuhtz, Wisconsin	
Laurette of Edgemoor	$975
Imp. Modesty of Edgemoor	825
A. C. Loring, Minnesota	
American Girl of Edgemoor	$1,000
W. E. Fisher, Wisconsin	
Imp. Bohemian Girl of Edgemoor	$1,725
Wm. Konrad, Wisconsin	
Susette of Edgemoor	$1025
T. H. Marsden, Wisconsin	
Royal Dame of Edgemoor	$1,475
W. G. Jamison & Sons, Wisconsin	
Danseuse of Edgemoor	$750
F. J. Reuping, Wisconsin	
Imp. Donnington Goldie 5th	$5200
L. E. Hageman & Sons, Minnesota	
Margy's Beda	$1,000
Konrad Bros., Wisconsin	
Duchess of Maple Hill	$2,000
Mrs. F. E. Fox, Wisconsin	
Imp. Hon. Lady Jebb of Chese Farm	$825
L. O. Jacob, Minnesota	
Show Girl of Edgemoor	$800

IMP. ITCHEN MAY KING, SOLD JULY 22 TO KINGSTON & FOX FOR $6,100

The Hired Man Speaks

HOARD'S DAIRYMAN:—The article on the front page of the Dairyman of June 25 on "The Farm Labor Problem" hits the nail squarely. The true reasons for the scarcity of hands on the farm are revealed in that article, and my experience as a hired man on the farm leads me to heartily coincide with the author. The truth was never more forcibly given.

During my experience as a hired man I have made it a point and special effort to study the cause of the shortage of farm labor. You can neither curb human nature nor can you trifle with it. You can't stop a good man with ambition and pride from going where he can see the desire of his heart. The farmers, as a rule, are to blame themselves for the shortage of farm help. Not all farmers are alike, thank God for that. How many farm homes are pleasant places to work? What is there to attract a full interest in the work? Just ask every man that has left farm work and gone to town, and the shop, and then form your own conclusion.

There are bad farm hands, but who raised them? Were they born and reared on the farm? If so, what kind of training did they get? The golden rule could very profitably be used on the majority of farms where help is hired.

How does a good hired man with any brains and ingenuity like to carry ensilage to 35 or 50 head of cattle from Pennsylvania to Indiana in a bushel basket? How does he like to pump water by hand? Come to this section and I will show you what greets your eyes while working on the farm. I will show you a large hog wallow that you have to jump into to open a gate that is tied shut with wire. A load of dirt or two would fill the wallow and the tobacco that is chewed would make a good gate, if the "farmer" had the money the tobacco cost. I have seen "Tight Wad" and "Scrub" farmers make their own butter and sell it all, and buy oleo. Does that encourage a farm hand with high ideals to love the farm and the noble cow?

Order and system, good tools to work with, a place to take a bath, a good light to read by, and some time for recreation, a good pay for good service rendered, social advantages, and scenery that is pleasing to the eye—the lack of these are some of the many reasons that men leave the littered up farms and go to the city.

Ohio. G. B. C.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

What California Pig Club Boys are Doing

Thirty pig club boys in Kern County, California, have compiled a report of their work for 1919 in a most interesting manner. The pig club boys will be interested in reading the bulletin they have put out.

The following is the summary by their local club leader, H. K. Dickson:

"The conclusions which one can safely draw after carefully studying the 30 boys' club reports on their 30 litters of pigs, and after watching these pigs develop during this last fall and winter seem to be as follows:

"First: Once the average pure-bred gilt is in good condition, weighing 300 to 350 pounds when a year old and bred to farrow at the age of fourteen months, she will hold her weight and develop a satisfactory litter of embryo pigs if she is pastured on alfalfa and receives from a pound to two pounds of mixed grain per day. Some gilts seem to do very well on this amount of feed even when in a small dry pen. However, a run of alfalfa pasture gives them a chance to get the necessary exercise and also the valuable green feed. The substituting of a pound of bran for grain during the last week before farrowing has proved very successful.

"Second: In gilt litters of 7 pigs the average weight per pig at birth is from 2¾ to 3 pounds each. Our gilts have averaged 7½ pigs each at birth and have raised 6¾ pigs each to weaning. In most cases in which only 7 pigs were born the gilt raised the full 7 to fine mature pigs. In litters which started with 10 or 11 pigs the usual thing has been for accident of some nature to kill pigs enough to bring the number down to 6 or 7. Our medium sized litters of 6 or 7 pigs to start with have proved most satisfactory from every point of view.

"Third: A sow raising a litter of 7 pigs should receive 3 or 4 pounds of grain per day for the first week after farrowing, and then the feed should be increased to 7 or 8 pounds by the end of the second week. The grain mixture should be at least ½ wheat middlings or some similar mill feed, with the other half ground corn or barley, or a mixture of the two. About 1 pound of tankage should accompany the grain rations. If skimmed milk is available, it should be used in making a slop of the middlings. Then the tankage is not as necessary. Alfalfa pasture is a very valuable feed for the sow during the full time that she is nursing the litter. It supplies green feed, protein, and exercise.

"Fourth: In some cases it seems advisable to increase the sow's grain ration to 9 and even more pounds per day, but this is usually not necessary and may even be dangerous, as too much feed sometimes causes the little pigs to scour. The remedy is to cut down the quantity of the sow's feed or change her ration to a new grain mixture.

"Fifth: The little pigs should have a separate trough of their own paneled off from the mother's by the beginning of the third or fourth week. Great care should be taken not to allow any of the slop or wet mill feed used in the little pigs' trough to sour. The little pigs should only be given as much or a little less slop than they will clean up at the time of feeding. Wet mill feed sours in the troughs in a few hours and the sour food causes indigestion and stunts little pigs. The pigs' trough should be thoroughly cleaned and washed out every few days. Disinfecting at the time of washing with a little sheep dip helps to keep the troughs from souring.

"An important item to note in the paneling off of a trough or self-feeder for the little pigs is to be sure that the lower board of the panel is high enough from the ground so that the little pigs never have to bend their backs to walk under it. A better plan is to cut a tall, narrow opening at one or both ends of the panel, so that the pigs can go through the opening into the enclosure, but narrow enough to keep the sow out. Pigs which crawl under panels, fences, or wires become sway backed or have a distinct drop behind the shoulders.

"Sixth: A self-feeder for little pigs is a very satisfactory way to feed them dry ground grain. Feeding dry grains helps to keep the little fellows from getting stunted by gorging themselves with slop. It also helps them to grow evenly. We are strong believers in self-feeders.

"Seventh: Little pigs at the age of 70 days can easily be made to weigh 55 pounds each without becoming fat or soft. Many litters with good care will average 60 to 65 pounds each at 70 days. Pigs which make such gains are most desirable for breeding animals, since they develop into even adults without having any part of their bodies stunted. In fact, our fastest growing pigs are very often our best pigs. There seems to be no argument for retarding a pig's growth below the limits noted. We would like to have all of our pigs average at least 60 pounds at 70 days.

"Eighth: The average cost of producing a pound of pork on pigs up to 70 days of age is a little less than 10 cents. In every case in which the boy forced his pigs as fast as they would grow, his cost per pound was 10 cents or less, even going below 8 cents in some cases. When the pigs were grown slowly so that their weight at 70 days was less than 45 or 50 pounds, the cost per pound gained was more than 10 cents per pound and the resulting pig showed various degrees of stunting which lowered his value. In every case the records show it does not pay to skimp on feed and stunt the pig. We have had little trouble in selling well grown out pigs at $50 each when 10 to 12 weeks old, but the pigs of the same breeding which only weigh 40 to 45 pounds at 70 days look just enough poorer so that people are not anxious to take them. We aim at having our pigs weigh 60 pounds each at 70 days and to be fast growing pigs throughout the whole period. Then they will not be little fat lumps due to forcing during the ninth and tenth weeks.

"Ninth: In comparing our results with those ordinarily reported by the producers of grade hogs or stock of a low degree of quality we can say definitely that pure-bred hogs of quality do prove themselves of superior value when considered simply as pork producers. Hogs of good blood do make it possible to use $60 corn at a profit when fat hogs are selling at 15 cents per pound. They make greater gains per pound of corn fed than the ordinary grade or scrub hog. The boys' club is anxious to see hundreds of pure-bred sows, of selection and quality, used as the production stock on the ranches which are producing fat hogs. Then we will have the class of pigs which can most economically use our grain. We will cut down cost of production and increase the quality of our pork products. We will be proud of Kern County's fat hogs. They will lead in California."

THE KIND OF PIGS AND BOYS TO RAISE

A Good Poultry Record

HOARD'S DAIRYMAN JUNIORS:—Last winter you asked me for a letter about my poultry record. I could not get my record sheets then, but now that I have them perhaps it will not be too late to let you hear from me.

On January 1st, 1919, I had 70 hens and by Dec. 31st, I had 107, which made an average of 68 hens for the year. This is the flock record as sent out by the Ohio State University:

Number of hens	68
Eggs per hen	129
Purchases	$150.48
Sales	335.70
Inventory gain	76.85
Gross gain	262.07
Feed cost per dozen eggs	.207
Profit per hen	3.85

The flock ranked tenth in egg production in the state, there being 41 farms in the list. I have both Single Comb White Leghorns and Rhode Island Reds. I had taken a correspondence course in poultry with the university and followed their instructions in regard to feeding.

I have a heifer which will be fresh in June, and my cow will be fresh in July. I think I will sell the cow and calf as I want to use the money for school. My prize cow came fresh a few months ago, and I had a fine heifer calf which we call Winner. I expect to take her to the fair next fall and I hope she will prove true to her name. Good luck to all the juniors.

Ohio. RUTH I. BEHNER.

Junior Dairy Clubs in Tennessee

The club boys and girls in half a dozen Tennessee counties have begun junior dairy club work in a definite way and from the increased interest in dairying generally this work will spread to the other counties. The object of these clubs as outlined by the University of Tennessee is, (1) to educate farm boys and girls in dairying; (2) to teach a means of providing cash income; (3) to raise more dairy cattle; (4) to place dairy cattle on a relatively larger number of farms; (5) to encourage a greater use of dairy products in the home.

A three-year plan which will enable the boy or girl to own and develop a calf through the first three years of its life and give the training in handling calves, yearlings, and two-year-old heifers in milk, is the adopted plan. The clubs are divided into three yearly contests as follows:

First year contest begins when the calves are first purchased and ends with a calf club show, or when the calves are approximately one year old. Club members should begin with calves six to eight months old, but calves only a few days old, which would otherwise be killed by dairymen to conserve the market milk supply, may be used if club members have milk available for calf raising.

Second year contest begins when the calves are approximately one year old and ends with a heifer club show, or just before they are due to freshen.

Third year contest begins when the heifer freshens and continues for one year or through the first lactation period, at which time a dairy cow show may be held.

A club or an individual member may start work on any one of the three years and continue the other two in logical order.

The county agricultural agent, after considering the needs, demands, and markets for dairy cattle and dairy products, requests the assistance of the club and dairy specialists; assistance in the organization and management of the club, the selection and purchase of the cattle, furnishing literature and information regarding the care, feeding, and management of the calves.

The county home demonstration agent will assist club members during the third year in the use and management of dairy products in the home. She obtains all necessary information from the home economics of the dairy specialist.

The standing of individual members the first and second years and the awarding of prizes are based on the following method of grading; individuality and condition of animal,

60%; methods of feeding and rations used, 20%; report, 20%. The basis of grading the third year is individuality and condition of animal, 30%; production milk and butterfat, 30%; exhibit of dairy products, 20%; report, 20%.

Through the co-operation of banks, schools, school superintendents, cattle breeders, and breed associations, it is expected (1) that club boys and girls will gain a better knowledge of dairying; (2) that their efforts will be made profitable; (3) that good dairy calves will be saved from slaughter; (4) that more dairy cattle will be raised on small farms; (5) that more milk and its products will be used in the homes.—G. L. HERRINGTON, Club Specialist.

Pennsylvania Boys in Dairy Cattle Judging Contest

The second annual state championship judging contest was held at the Pennsylvania State College in connection with the Summer Farmers' Week on June 23rd, in which sixteen counties were represented by twenty teams. A team from Wayne County won the contest with a score of 731 out of a possible 900 points and will represent Pennsylvania at the National Dairy Show at Chicago. The team was composed of Friend E. Uhl, Rush Osborn, and Ross Simonds.

Professor A. L. Beam, assisted by other members of the Dairy Husbandry Department, had charge of the contest which was conducted according to the rules of the National Dairy Show. Three classes were chosen from the college herd to conform as closely as possible to the ideals of the breeds. The ring was composed of a class of Holstein cows, one of Guernsey cows, and one of Holstein heifers, the variations in each class, between animals, being practically equal.

The following counties were represented by teams in the contest: Wayne, Center, Tioga, Erie, Sullivan, Cumberland, Mercer, Susquehanna, McKean, Indiana, Lackwanna, Cambria, Blair, Lycoming, Monroe, and Juniata.

Not only was the winning team awarded a trip to the National Dairy Show but they also led in the judging of Holstein-Friesian dairy cattle, for which the Holstein-Friesian Association presented them with a beautiful silver loving cup.

The Center County team won second place and will represent Pennsylvania at the Eastern States Exposition in September.

A mock sale was conducted as a price determining contest in which the following boys valued the ring nearest the figure set by the ten prominent Holstein breeders and were awarded ribbons: First, Friend E. Uhl; second, Rush Simonds; third, Ross E. Osborn; fourth, Stanley Fuhrer; fifth, John Metzker.

Pennsylvania. A. BARNHART.

Your Worst Enemy

I am more powerful than the combined armies of the world.

I have destroyed more men than all the wars of the nations.

I am more deadly than bullets, and I have wrecked more homes than the mightiest of siege guns.

I steal in the United States alone over three hundred million dollars each year.

I massacre thousands upon thousands of wage earners a year.

I lurk in unseen places and do most of my work silently.

You are warned against me, but you heed not.

I am relentless.

I am everywhere in the house, on the streets, in the factory, at the railroad crossings, and on the sea.

I bring sickness, degradation, and death, and yet few seek to avoid me.

I destroy, crush, or maim; I give nothing, but take all.

I spare no one, and I find my victims among the rich and poor alike, the young and the old, the strong and the weak. Widows and orphans know me. I loom up to such proportions that I cast my shadows over every field of activity from the turning of the grindstone to the moving of a railroad train, from the rocking of a boat to the spinning of a top.

I am Carelessness.—"Bindery Talk."

Junior Letters

Hoard's Dairyman Juniors:—How are you getting along with your spring work and your gardens? I was going to have a garden with carrots, onions, cabbage, parsnips, and peas, and so on, but I have changed my mind about it and I planted just potatoes and a little bit of sweet corn. I wish some of the junior girls would write to me and tell me what they planted in their gardens.

We have two cows and a year-old heifer and a two-month-old bull calf. Our cow's names are Daisy and Maudy. Our heifer's name is Spotty. The bull calf's name is Tommie. We have two pigs which we bought last fall.

My father doesn't know how to milk yet, but he was learning today. He did pretty well for the first time. He was learning to milk on Maudy. She stood still while he milked, but when my mother came to milk her she started to kick and stepped on her toes and spilled part of the milk.

I wish good luck to all the juniors and that some of them would write to me. My address is Box 44, Dover, Wis. Theresa Ralrisitz.

Hoard's Dairyman Juniors:—I am going to tell you about my experience in raising chickens. When I first got them they were one day old and so I took them and put them in a lamp brooder with a nice, warm fire under them. It is heated like this: I dig a hole under the brooder big enough to get the lamp in and out easily. A hole about two by three inches is cut in the bottom of the brooder when it is made and a piece of tin nailed over it so that the wood will not burn. Then I put some clean sand in the bottom of the brooder on the tin. That is the way they keep warm. I left the lamp under them about two weeks. When I started to feed them I fed just a little baby chick scratch feed, then I feed them boiled eggs about two or three weeks, then started feeding a wet mash and am feeding that now. I started with 118 and have 91 left, which is pretty fair. As my letter is getting long I think I will close, hoping any other junior raising chickens good luck.

Oakdale, Cal. George French.

Hoard's Dairyman Juniors:—I now have all our cows tested; the herd averages 4 per cent. Is not that pretty good? One of the cows tested 6.2% and some of them only tested 2.2%. I have just learned how to operate the tester. It is surely interesting to run one and I have persuaded dad that it pays to test.

I expect we will have a sale soon; am going to sell my heifer, also my colts.

Papa bought a new Sedan the other day and it runs like a top. I ran it about twenty miles yesterday; drove it in and he drove it back out. He also ordered a tractor. It will be here soon. We sure need a good tractor as all the volunteer wheat has come on and we have about 400 acres of wheat and only 40 to list up.

Kansas. L. W. Mowry.

Hoard's Dairyman Juniors:—I have been in your club some time and enjoy reading the junior page that appears in the Hoard's Dairyman each week. On this page are a good many interesting and true things. The stories about Bob Ramsay are especially good.

Last month I bought a cow. She cost me a price that may seem too much so I will not write it. I bought a cow April 12, 1918, for $150. She was fully three-fourths Holstein, and nine-tenths white. I sold her on May 10, 1919, for $180. Besides the $30 clear money she paid for herself, her keeping, the interest at 7%, and I had $30 in the Savings Bank. The cow I have now is even whiter than my first one was as she only has a bit of black on her ears. I like them a little blacker than that, but they give a good lot of milk and that is the main part of a cow, so I can not kick.

Since I wrote last we have sold the home place of eighty acres and bought a farm five miles northeast of Lawrence on the Kaw Valley Interurban route from Kansas City to Lawrence. This is very handy. We ship our milk to the Myer Sanitary Co. in Kansas City. It leaves our place at 9:30 a. m. and is in Kansas City by mid-afternoon. We milk 18 cows at present and get on an average of 50 gallons of milk a day. In our herd of Holstein cows are 3 pure-breds and about 35 high grades. We keep a pure-bred sire all the time. We have built a 6-room bungalow, a 30x40-ft. dairy barn, and a milk house. The man we bought the place of had not improved it any to speak of for the last 15 years. The fences were very poor, and things down and out in a general manner. We have put up a mile of fence and still have some to put up. We raise cane entirely for our silo.

I go to school in town. I plan to go to high school next fall. After that course is completed I would like to go to the state agricultural college at Manhattan.

I would like to hear from some of the juniors who are interested in Holstein dairy cattle. My address is R. F. D. No. 7, Lawrence, Kansas. Raymond E. Gardner.

Hoard's Dairyman Juniors:—I have been reading the junior letters and find them very interesting. I have never written before but would like to join your club. I like to read the letters of Jimmy Greene and Bob Ramsay.

I passed the eighth grade this year with one of the highest averages in the township. I expect to take up the high school work this fall.

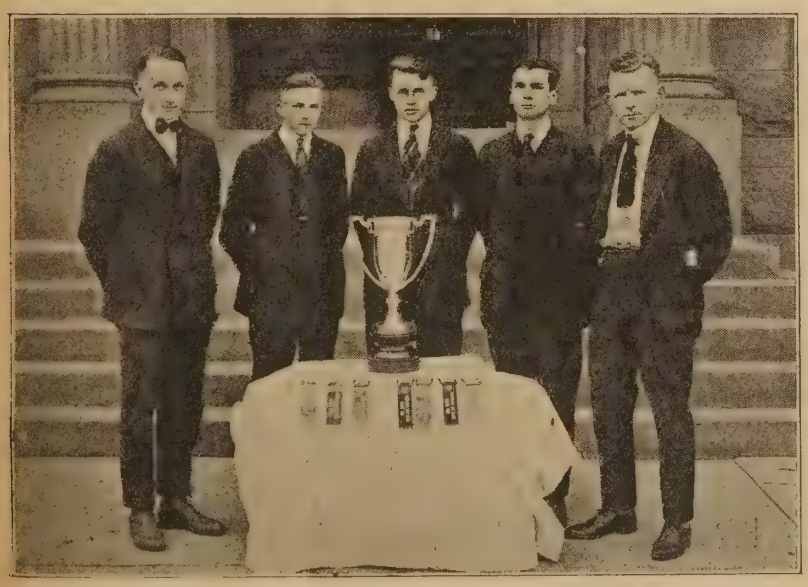
I live on an eighty-acre farm three miles from town. We are engaged in the dairy business with the Holstein-Friesians. We have four pure-bred cows and four heifers. We erected a large barn sixty-six feet long and thirty feet wide for them last summer. I milk three cows and feed all the cows grain night and morning.

We are expecting an electric plant to arrive one of these days.

I hope to see this letter in print. Well, as my letter is getting rather long I will close wishing all the juniors good luck. I wish some of the juniors would write to me and I will be sure to answer them. My address is R. F. D. 2, Box 17, Ringsted, Iowa.

Opal Kyhl.

Hoard's Dairyman Juniors:—We have eleven head of cattle; nine are Holsteins and two are Jerseys. We are milking five. We have six horses and six pigs, forty-five head of sheep, some of which are lame. We put out forty acres of corn and it is all large enough to plow. Also put out thirty acres of oats. Have about thirty acres of hay and fifty-four of wheat. We live on an eighty-acre farm and rent a hundred and sixty acres across the road. I have two grade Holstein heifers and an 11-year-old driving colt. I will not break him yet. My heifer will be fresh this fall.



We live near the conservation district. The land in the district will be flooded when the dams are completed.

One day you asked in the junior department what we read. I read the farm papers and dailies mostly.

I think four milkings a day are all right when on test or any other time for the calves eat whenever they are hungry.

I will write to anybody that writes to me. My address is R. 4, Sidney, Ohio.

Ralph M. Williams.

HOLSTEIN-FRIESIAN ASSOCIATION CUP WON BY WAYNE COUNTY TEAM
From left to right: Mr. Jacobs, coach, R. Simonds, R. E. Osborn, F. E. Uhl, Mr. Wakeley, coach.

Do You Belong to the Juniors Club?

If you are a dairy farm boy between ten and eighteen years of age, and if your father or some member of your family is a subscriber to HOARD'S DAIRYMAN, we want you to join the HOARD'S DAIRYMAN Juniors Club.

The Juniors Club consists of several thousand boys like you, banded together to help each other get more pleasure and profit from farm life, and to have the advantage of associating with other boys who live and work and think as you do.

It costs nothing to join the club—and there are no dues. All you need to do to join is just to fill out the coupon and send it to us. We'll at once enroll you as a member and send you a watch fob, a coat lapel button, and the "Dairy Farm Boy's Creed". Do it now—then you'll soon be a full fledged member of the HOARD'S DAIRYMAN Juniors Club.

COUPON

HOARD'S DAIRYMAN Juniors,
Fort Atkinson, Wisconsin.

I want to join your Juniors Club. My father's name is _____.

I am _____ years old and like _____ (name breed) cows best. Send me the watch fob, button, and creed and enroll me as a member.

Name _____

P. O. _____ State _____ R.—

The rate for advertising in this department is 10 cents per word. Count address. Remit in advance. Copy must reach us 8 days ahead of date of issue. Farm labor advertising 7c per word.

FARMS FOR RENT

For Rent—Dairy farms. We are adding two more farms March 1, 1921. They will be operated as pure-bred Holstein farms. Tenants to furnish horses, machinery, all labor. We furnish the land and capital for one-half the cattle and, if necessary, will back the right man for most of the capital necessary to purchase his half of cattle on such liberal terms that the cattle will pay for themselves. This is a great opportunity for the right man—especially if he has experience in making records—to become associated with the largest pure-bred Holstein organization in the country. Fertile farms, good location, milk factory market. Selling organization that relieves you of all care or worry about the selling end. In fact, the chance of a life time. Please give full particulars about yourself and your references in first letter. WOODLAWN FARM, Sterling, Ill. 2-2.

Over 100 acres fine land, 17 miles macadam roads to City Hall, Philadelphia. 1½ to large manufacturing town of Ambler. Modern cow barn, 48 standing, 4 box stalls. Milk room, feed room, cement floors. Large implement and tool house. Large hollow tile slate roofed house (not finished inside.) Macadam roads each side and through farm. Very moderate rent, desirable tenant. Immediate possession. Rent free for one year. FARM, 2024 N. Tenth St., Philadelphia, Pa. 25-4

E. R. THOMAS, Sumner, Wash. 2-3

Cow Waters Herself

with this wonderful new **Libbey Automatic Water Bowl.** Animal moves lever, opening water valve, when it starts to drink. Lever swings back, closing valve, when animal stops drinking.

15% More Milk

Milk is 87% water, and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15% to 20%, which soon pays for the bowls.

Libbey Automatic Water Bowls

are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circular and prices, also FREE DAILY MILK AND FEED RECORD.

If interested in Stanchions, Stalls, Carriers, etc., ask for free General Catalog.

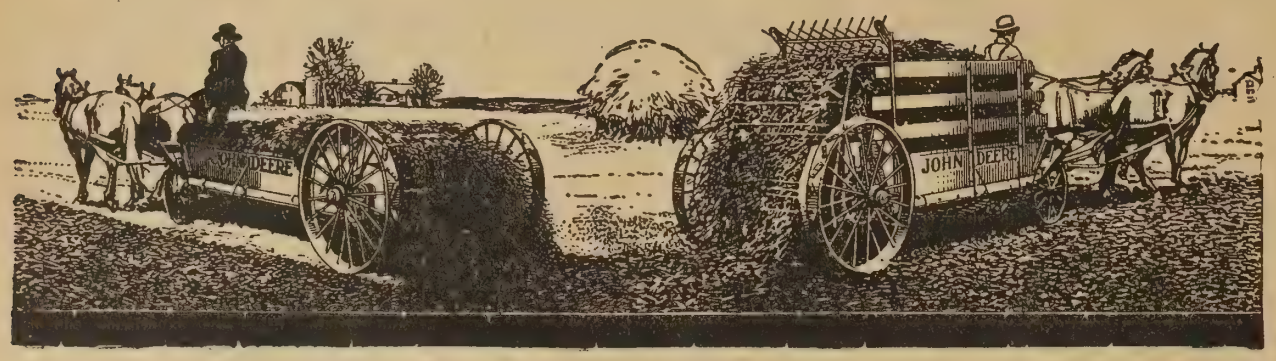
Have You A Little Spare Time?

Have you a car—or a horse and buggy?



HOARD'S DAIRYMAN would like to offer you a proposition to look after our subscription interests in your community during your spare time.

It would be light, pleasant work among your old neighbors; and we can make it really profitable, too.

Write and tell us about the territory around you and how much you could take care of, and we'll make you a proposition.

Hoard's Dairyman, Fort Atkinson, Wis.

Get Double Use and Double Profit From Your John Deere Manure Spreader

SPREADING manure is only one of the money-making jobs you can do with the John Deere Spreader. Get the straw spreading attachment at slight additional cost and you have a perfect straw spreader.

The John Deere Spreader equipped for straw spreading is not a two or three-man outfit. One man can put on the attachment, load the spreader, and spread the straw perfectly with no extra help—a big advantage during the present period of farm help scarcity.

The straw spreader operates just like the John Deere Manure Spreader. Set the feed lever for the kind of spreading desired, throw the machine in gear and drive the horses or tractor—the spreader does the rest.

It's only a 30 minutes job to take off the straw spreading attachment preparatory to manure spreading—you get a perfect two-in-one machine.

This NEW SPREADER BOOK Will Interest You —It's FREE

This booklet not only fully illustrates and describes the John Deere Manure Spreader and straw spreading attachment, but also tells all about manure and straw, when and how to spread it to get the most out of these valuable fertilizers. Drop a post card today—ask for Booklet SS414.

Manure Spreader Advantages Not Disturbed In Making It Possible To Spread Straw

You get the beater on the axle which makes extreme simplicity possible; enclosed drive gears running in an oil bath; the low down, easy-loading feature; high drive wheels which lighten the draft and furnish extra traction; and all main working parts mounted on the axle where they can't get out of line to cause binding, heavy draft and breakage.

It is not at all uncommon to see two and three John Deere spreaders on one farm where that number is required—there's a reason. Its good working qualities combined with extra years of service and low cost of upkeep, make the John Deere a mighty profitable spreader investment—doubly so since the perfection of the straw spreading attachment.

Remember this, spreading straw is profitable—straw has as much fertilizing value as the average barnyard manure—and has the added advantage of being excellent material for top-dressing fall seeded crops, alfalfa and clover. You can't afford to waste it.

If you now own a John Deere Spreader see your John Deere dealer about the straw spreading attachment. If you are needing new spreader equipment, don't fail to look into the many advantages of the John Deere as a machine for spreading both manure and straw.

head brought $425, and its members, of all ages from two months up, brought an average of $335 from seven different bidders. Other feature individuals were Harbor Hill Pioneer, a bull tracing to Imp. Masher's Galore on both sides of his pedigree and with dams averaging 615.4 pounds of fat in the first two generations; and Matilda of Antrim, a four-year-old bred to freshen in July. The former brought $410 and will be used by J. B. Vance, Frank Majewski, F. L. Purviance, R. N. West, R. T. Peterson, and E. W. Petzel, in the bull club mentioned above. Matilda of Antrim brought $570 from Wallace and Fordyce, a new Guernsey breeding firm, which topped the sale and also purchased the largest number of animals (seven) and was the heaviest purchaser with a total of $2,640. Roy Bush of Outlook was second in number purchased, amount paid for individual, and total purchases. The 40 head brought $12,185, an average of $305 per head.

The officers of the association are H. E. Angel, president; A. L. Wallace, vice-president; R. N. West, secretary-treasurer; and F. A. Majewski and J. B. Vance, directors.

With a total of about 150 head, Yakima County is now ranked third in the state of Washington as a Guernsey breeding center by Mr. Musser, who regards the recent importation as one of the most important live stock events of the year in this state. Although the Canterbury Shakers did no official testing, individuals from that herd which have been purchased elsewhere have made fine show and production records, and the longevity of the herd, coupled with the fact that it has been producing 90 per cent female calves, is regarded by the extension specialist as of great value to the Yakima breeders. Yakima is a great beef and dairy cattle center, its production of alfalfa, corn, and sugar beets being excelled by no district in the Northwest or perhaps in the country. Guernseys are destined, as a direct result of the work of the association, to become important factors in the agricultural activities of what has heretofore been principally a Holstein stronghold.

Government Publications

The Dairy Division gives the following list of publications of the U. S. Department of Agriculture of interest to milk dealers, available for distribution as long as the supply lasts:

1. "Monthly List of Publications." This is issued each month and gives a list of all publications of the Department issued during the current month. Any bulletins on this list can be obtained by applying to the Division of Publications, Department of Agriculture, Washington, D. C. The list can be obtained by applying to the same address.

2. "List of Farmers' Bulletins." This is a list of all Farmers' Bulletins that are available for free distribution. Division of Publications, Department of Agriculture, Washington, D. C.

3. "Publications of the Department of Agriculture Relating to Dairying." A list containing the names of the most recent bulletins on subjects relating to dairying. Obtained from Library, Dairy Division, Washington, D. C.

4. "Price List 38" gives the titles of all circulars and bulletins of the Bureau of Animal Industry that can be obtained at prices of from 5 to 10 cents each. Superintendent of Documents, Washington, D. C.

5. "Health Officer Letters," Dairy Division, Washington, D. C.

6. "Milk Plant Letters," Dairy Division, Washington, D. C.

7. "Monthly Report of Milk Prices in United States" shows prices received and paid for milk by milk dealers throughout the country. Issued each month by Bureau of Markets, Washington, D. C.

8. "Market Reporter." Issued weekly by Bureau of Markets. Statistics on production, storage, prices, etc., of farm products including dairy products.

9. "Monthly Condensed Milk Report." Bureau of Markets.

10. "Monthly Cold Storage Report" includes dairy products. Bureau of Markets.

11. "Daily Butter and Cheese Market Report." Bureau of Markets.

12. "Weekly Report and Cheese Review." Bureau of Markets.

13. "Monthly Report of Exports of Dairy Products." Bureau of Markets.

14. U. S. Department of Agriculture Bulletin No. 849, "City Milk Plants, Construction and Arrangement".

A Tri-county Picnic

The Marathon—Lincoln—Langlade Tri-county (Wis.) Jersey Breeders' Picnic held June 19th at the farm of Chas. Shotte was a glorious success. There was a good representation from the three counties participating, some journeying as far as forty miles to reach the picnic grounds. An estimated attendance of three hundred were there.

A short address of welcome was made by Mr. Schotte, the president of the Langlade County Association.

Mr. Wm. Bewick, county agent of Langlade County, expressed his thankfulness for the fine day and the size of the crowd. He mentioned Jersey quality and said he had observed that Jersey breeders, also, as well as their breed of cattle, surpassed in the quality of support rendered to the cause of progressive agriculture.

Mr. A. J. Peterson, secretary of the Marathon—Shawano Jersey Association, and a strong Jersey man, spoke. He said he was a satisfied man in regard to present conditions, also for the reason that he is a breeder of Jerseys. But, he pointed out, Jersey breeders are apt to be too satisfied for the good of their breed, and, for that reason, do not agitate the Jersey subject sufficiently. He told how some other breeds are apparently more successful, owing to the publicity they are getting and the money spent in advertising.

Mr. George Curtis, one of the best Jersey breeders in Lincoln County, after some short preliminary remarks, tackled the Jersey subject by saying that it is not enough to own just Jerseys, we must have good ones and pay attention to blood lines and breeding. Praising the spirit that urged the instigators of the Tri-county picnic and predicting as well as hoping that there would be more such in the future, he volunteering all of his powers to make them successes.

Miss Brady, the home demonstration agent for Marathon County, spoke well of pure-bred cattle and especially the Jersey. Miss Brady stated that women are willing to co-operate with men on the farm, but conveniences in the home should not be lost sight of, such as water system, laundry, and kitchen conveniences, in a farmer's absorbing occupation of improving his stock and farm conveniences. The speakers drove home the fact of the value of milk and other dairy products as health and nourishment—giving elements to old and young. She told of experiments that had proven the superiority of whole milk over other kinds of food. She deplored the use of other forms of butter (imitations) instead of the real article, for the food value is not nearly so great in the imitations.

County Agent F. G. Swoboda of Marathon County made the statement that community breeders' associations and breeders of good stock are the best citizens in existence in point of progress. It is this class that has put Wisconsin on the map. In speaking of associations, the speaker said it is not merely holding a successful summer meeting and an annual winter meeting that is sufficient; these associations must do other work and keep right on their jobs. He said that June is the month of breeders' picnics, and that farmers should not regard other work as more important than joining with their neighbors on such occasions.

Mr. Swoboda rapped the farmer who sells his dairy products and buys butter substitutes for home use, as a poor example for keeping up dairy popularity and prices. We should advertise our products and thus educate the masses to their use.

Mr. Charles A. Peterson, sent as a representative of the American Jersey Cattle Club, was then introduced. Mr. Peterson said there is a conception that Jersey sentiment is declining, but this conception is wrong, as the Jersey never was as popular as now and the Jersey cow's popularity is going to increase. He said that the Jersey is the supreme cow for the pioneer farmer. Mr. Peterson complimented the Langlade County Association as having done more than any other Jersey Association in the state. He said record prices are being paid at sales, and that if other breeds seem to be getting the best of it—Jerseys keep advancing with the rest of them. He told how to advertise Jerseys. Mr. Peterson, being actively engaged with Jerseys and farm bureau work, closed his address by telling something of the farm bureau and the great work it is doing in getting farmers and their different associations together.

AYRSHIRES

1 Registered yearling bull. Also 5 good grade heifers, 2 milking, 3 to freshen in spring. All sired by a grandson of Substantial of Highland, sire of 4 A. R. daughters, among them April Bloom of Highland, 440.25 lbs. fat, brother to Rena Ross family. $600 if taken soon.

Mrs. Aug. Neumann, R. 2, Princeton, Minn.

Summary of Ayrshire Records

During the quarter just finished one hundred and fourteen Ayrshire cows qualified for the Advanced Registry with an average production of 10,731 pounds milk, 429.92 pounds fat.

Gossard Breeding Estates has the leading cow in Henderson's Dairy Gem with a record of 20,042 pounds milk, 803.71 pounds fat, testing 4.01 per cent fat. They also have the leading cow in the senior four-year-old class. Monstone Farm, Massachusetts, also has two class leaders while Skylands Farm, New York, Woronoake Heights, Massachusetts, and Friends Hospital, Pennsylvania, furnish one class leader each.

Sears and Howell of New York completed their first Advanced Registry record on a home bred cow, A4 of Blooming Grove, that finished one of the ten leading records in her class. The number of records completed shows an increase of fifty-seven per cent against the preceding quarter.

The Roll of Honor records for 300-day production show a marked increase. Ninety-seven records have been completed of which twenty-seven were completed during the past quarter. All records completed to date in this division show an average production of 10,019 pounds milk, 404.47 pounds fat.

Economy in Production ← GUERNSEYS → Quality of Products

87 Gold and Silver medals have been offered at the Milk and Cream Show held annually in connection with the National Dairy Show. 71 of the winners have informed us regarding the breed of cattle that produced the products exhibited. The reports show that Guernsey milk and cream won 43.6 per cent of the 71 medals, and other milk and cream to which Guernsey products have been added won an additional 16.9 per cent. Let us tell you why the nation's greatest dairy products show gives highest honors to the products of the Guernsey cow.

THE AMERICAN GUERNSEY CATTLE CLUB, BOX H 73, PETERBORO, N. H.

The Second Southeastern Guernsey Breeders' Sale

to be Held at Salisbury, N. C., Aug. 12th, 1920

In Co-operation with Rowan County Guernsey Breeders' Ass'n

This offering will consist of thirty-five selected Guernseys, and will come from four different states and about twelve different herds. These animals were selected by a Committee and are pronounced the best bunch of Guernseys ever offered at public auction in the South. They are from herds all under Federal inspection and every animal is guaranteed a breeder. There will be five bulls, whose dams average over 600 lbs. of fat each, and thirty females from six months to four years of age. Among them are daughters of some of the best bulls of the breed and granddaughters of the sensational Guernsey bulls. Two granddaughters of King of Chilmark, one of them bred to a son of Chilmark; eight granddaughters of Itchen Daisy's May King of Langwater, a granddaughter of Dolly Dimple's May King of Langwater, granddaughters of Ne Plus Ultra, granddaughters of Border Raider, and some of the very choicest Guernseys from the best herds in the Southern States. Three splendid heifers bred to a son of King of Chilmark, who is full brother to Lady Du Chene.

We feel that all Guernsey breeders will be interested in the kind of animals that will be offered in this sale and would suggest that you write early for catalog to

Do You Want A Guernsey Bull

Closely related to Pergue's Crescent A. R. with a record of 13,316.9 lbs. milk and over 582 lbs. fat in Class EE and dropping two calves within the year, entitling her to second place in her class? Some excellent young bulls closely related to Pergue's Crescent ready to head your herd. Write for descriptive circular, or come and see them.

Ernest W. Sass, Box H, Streator, La Salle County, Illinois.

Guernsey Bulls

Two good yearlings for sale at $150.00 each. The dam of one has an A. R. record of 403 lbs. fat in F. and is doing better on retest. Dam of the other has a show record and is on official test.

Folly Farm, - Libertyville, Ill.

Blackleg

My farmer writes me that blackleg has developed among the cattle in my neighborhood. I thought that blackleg was confined to cattle on the western plains and should be glad to know how far east you have ever heard of its extending.

Chicago. J. D. B.

Blackleg is most prevalent on western farms and cattle ranches, but may occur elsewhere. An error in diagnosis may have been made. It would be well to obtain a detailed description of the symptoms shown by the affected animals. If you send it to us, we shall be glad to give an opinion as to the disease present. It would be better, however, to have the local veterinarian investigate and if necessary vaccinate against the disease. It may be added that anthrax and hemorrhagic septicemia often are mistaken for blackleg, or vice versa.

Falcon's Gallant

Dropped March 4, 1920.

Sire: *Falcon's Proud Warrior 47559*, pronounced by many to be one of the greatest bulls of the breed, both from breeding and individuality.

Dam: *Fidelis of Falcon's Flight 54398*, whose A. R. record shows 502 lbs. fat and who carries the blood that has made the Falcon's Flight herd nationally famous.

Send for particulars on Gallant. At his price ($500.00) he is bound to be a sterling investment.

Falcon's Flight Farms, - Litchfield, Conn.

In the July 2d Issue

of the Hoard's Dairyman, page 1446 is an account of the Anna Dean Sale. If you read this you will notice that twenty-five daughters of Imp. Goldseeker of Anna Dean Farm sold at an average of $500. I am offering for sale three bulls by same sire as these heifers. One of them out of a daughter of Masher's Sequel with a record of 635 lbs. of fat. On the inside cover of the Guernsey Breeders' Journal, the last issue, you will find a picture of this cow's sister. I am also offering for sale a daughter of Imp. Clipper that sold for $1,950.00 at this sale.

W. W. CLARK, - Vesper, Wisconsin

For Your Herd Sire—A Son of Matador Segis Walker

Out of Hazelwood Alban Ormsby

EAR TAG ■ 1033

MATADOR SEGIS WALKER ORMSBY. Born 11-7-18.

Sired by MATADOR SEGIS WALKER, senior herd sire at our Seattle farms. He has 28 A. R. O. daughters, 23 averaging in two-year-old form over 20 lbs. butter from over 400 lbs. milk. Three of his daughters in three-year-old form averaged 30.30 lbs. butter from 531.2 lbs milk. His first three daughters in 2-year-old form to finish for 365 days averaged 798.68 lbs. butter from 20,761.5 lbs. milk. We now have 11 of his daughters on yearly test from which we expect good results.

His dam, Hazelwood Alban Ormsby, as a 4-year-old, made 23.71 lbs. butter from 460 lbs. milk. Her dam, Hazelwood Hartog Alban De Kol, has a record of 23.71 lbs. milk as a four-year-old. She is by a brother of Marion Walker Pietertje, who has a record of 31.63 from 560.70 lbs. milk in 7 days and 121.15 lbs. butter from 22,070 lbs. milk in 30 days.

An excellent sire of good breeding. He is beautifully marked and about three-fourths white. Very straight, with a good middle. Shoulders smooth and even. His dam is due again in August and we expect her to make a creditable record, but the bull is offered at $750. Can be seen at Oconomowoc, Wis.

Write today for our new sales list No. 103 offering for sale sons of Carnation King Sylvia, Avon Pontiac Echo and Matador Segis Walker.

E. C. SCHROEDER FARMS, - MOORHEAD, MINNESOTA

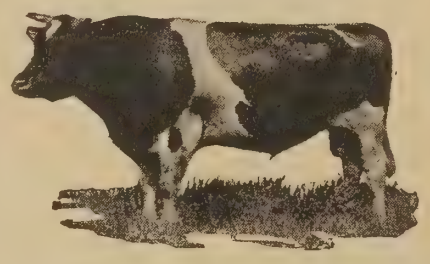
(A FEDERAL ACCREDITED HERD)

Minnesota Holsteins

Miss Korndyke Akkrummer Ormsby 30-lb. 4-year-old. 39.67 lbs. butter at full age. Owned and developed by J. B. Irwin.

For Your Next Herd Sire

get a son of Sir Ormsby Banostine Champion, son of Duchess Skylark Ormsby, world record cow. We have some good ones for sale from dams with good 7-day and year records.



Woodlake & Clover Farms,
John B. Irwin, Station F,
Minneapolis, Minnesota.
"The Home o the Ormsbys."

Use A Son of "Piebe"

from one of our good year record cows to head your herd. He will bring what you want—better individuality and increased production.

Piebe Laura Ollie Homestead King is, as you know, the phenomenal present day sire with 7 daughters that average over 20,000 lbs. milk in a year as 2-year-olds. He is a show bull as well, and his sons are as good.

We have one or two left that are almost of serviceable age. Write or wire today if you are interested.

MINNESOTA HOLSTEIN CO., V. S. Culver, Sec'y & Mgr., Austin, Minn.

Lola Segis Pontiac Homestead

the highest record bull in southern Minnesota, heads our herd. His sire, Piebe Laura Ollie Homestead King, has more daughters that as 2-yr.-olds have produced 20,000 lbs. milk in a year than any other. His dam, a 34-lb. 4-year-old daughter of King Segis Pontiac Count, has 3 records averaging 33 lbs. and has made over 1,000 lbs. in 1 year. We have a few serviceable bulls and younger from A. R. O. dams for sale.

Clover Lea Farm, W. W. Walker, Owner. Austin, Minnesota

THE LASHBROOK HERD

Headed by SIR WALKER SEGIS HOMESTEAD, first prize yearling bull, Chicago and Waterloo, 1919. His dam, Beauty Beets Walker Segis, made 25,343 lbs. milk, 1,040 lbs. butter in one year, World's Record for Senior two-year-old heifer. Her sire, KING SEGIS PONTIAC COUNT. We have several choice bull calves, two to five months old, from A. R. O. cows or cows on yearly test. $400—$500 apiece. Send for pedigrees and photos.

A. J. LASHBROOK, NORTHFIELD, MINN.
Herd Federally Accredited

Do You Need a Bull?

I am offering a splendid yearling for sale. He is growthy, well marked, and as straight as a line. His dam is a 24-lb. 4-year-old daughter of Sir Veeman Hengerveld and his sire a 28-lb. son of King of the Black and Whites. His 11 nearest dams average 28 34 lbs. in 7 days. Several younger bulls for sale.

E. J. BROSIOUS, STILLWATER, MINN.

Grandsons of Sir Pietertje Ormsby Mercedes

The sire is Sir Pietertje Ormsby Mercedes 22d a son of Minnesota's first 1000-lb. cow. These bulls are all nicely marked, straight top lines. Very good individuals from good A. R. O. dams. For pedigrees and prices, write

O. J. GROVER, - GLYNDON, MINN.

SOUTHERN BREEDERS

If you are in the market for a bull of serviceable age don't overlook this opportunity to get an acclimated bull of real show type, from a 17-pound junior three-year-old.

Herd under State and Federal supervision.

Also calves from Ormsby dams by a 32-pound grandson of MAY ECHO SYLVIA. Visitors always welcome. Photo and pedigree on application.

BOSTWICK & SON, - ARDMORE, OKLA.

Yearly Record Blood

Bull calf born Dec. 19, 1919. Sire Maplecrest Avalon, whose four nearest dams average 1,067 lbs. butter in a year, three of them being 1,200-lb. cows.

Dam by a son of Dutchland Creamelle Korndyke Lad with five dams in her pedigree over 1,000 lbs. butter in a year. She is now on yearly test as a senior two-year-old and is proving a very persistent milker. The calf will have nine dams in his pedigree that will average 1,085 lbs. butter in a year, an unusual combination. Price for prompt sale, $200.

AVALON FARMS, E. D. Curtis, owner, Bantam, Conn.

FOR SALE!

Segis Pontiac Black Hawk

BORN FEBRUARY 7, 1918

A son of a 29-lb. sire and from a 24-lb. cow. A grandson of the "marvel of all sires", KING SEGIS PONTIAC COUNT. The daughters of the latter hold more World's records, (6) in the regular divisions than those of any other two sires. He already has (6) daughters with year butter records above 1,000 lbs. and is the only sire to have all daughters with year milk records above 20,000 lbs. Write us for pedigree and price.

Lake Meadow Farm, - Wayzata, Minn.

Mankato Holstein Farms

are combining the best of Ormsby breeding through the sons of these great proven long distance sires: Sir Pietertje Ormsby Mercedes, Ormsby Korndyke Lad, King Korndyke Colantha Ormsby. These great sires have 22 daughters over 1,000 lbs. and 35 over 30 lbs.

A Federal Accredited Herd.

Marlow & Randall, - Mankato, Minn.

BULLS—Two of Them.

Ready for service. One light and one medium in color. One sired by our DUTCHLAND CREAMELLE COLANTHA LAD, from a good daughter of SIR WINANA BEETS SEGIS. The other sired by SIR WINANA BEETS SEGIS from a daughter of SEGIS JOHANNA GRAHAMHOLM. Both cows are on yearly test now and are making good records. Don't buy a bull until you have seen and studied the pedigrees, pictures and prices on these youngsters. They are good ones.

Facts in BLACK & WHITE

How a Purebred Holstein Sire Increases Profits

Here is just one instance of the results obtained by the Iowa Agricultural Experiment Station in tests covering ten years. A scrub cow had a record of 4,588.4 lbs. milk and 201.67 lbs. fat at 6 years of age. Her daughter by a purebred Holstein bull produced as a 4-year-old, 6,822.8 lbs. of milk and 283.75 lbs. of fat, an increase of 49 per cent in milk and 41 per cent in fat over the dam's best record.

That evidence, easily verified, should be pondered over well by farmers and dairymen who are desirous of more profit per cow, but who are putting off buying a Purebred Holstein Sire. Send for our extremely interesting booklets today. It means money to you.

The Holstein-Friesian Association
101 Hudson Street, Brattleboro, Vermont.

Ready For Service

Iowana Pontiac Homestead 267584, a son of OAK DE KOL OLLIE HOMESTEAD 85529, and therefore a brother to Piebe Laura Ollie Homestead King, (5 20,000-pound two-year-old daughters). His dam, Iowana Aaggie Pontiac Fayne, is a daughter of SIR JOHANNA FAYNE 42147, (8 20,000-pound daughters) has a record of 22.9 pounds in seven days as a four-year-old and is now doing well on yearly test. Her dam is a great foundation cow with over 750 pounds butter in a year. Buy him now as he will undoubtedly be worth more money when his dam finishes her year. Price $750; send for pedigree and photo.

Our herd is under Federal Supervision.

IOWANA FARMS, - DAVENPORT, IOWA

Do You Want

A 30-lb.—1000-lb. Ormsby Bull?

If you want one of that kind—and a real individual, write for our sale catalog. We are moving our herd to California and rather than take these bull calves we are offering them at sacrifice prices.

They are sons of Sir Ormsby Skylark, the sire of Duchess Skylark Ormsby, and they're from cows with records of from 27 to 40 lbs. that either have or are making good yearly records. (Several of those dams have over 30 lbs. and will finish the year well above 1,000 lbs.)

Better write today for that sale catalog.

MAXWELL FARMS - - - - WATERLOO, IOWA

A Good Consistent Pedigree

Isn't it worth more than a high record or two in a weak pedigree, which shows no certainty of transmitting Production?

We offer *3 SERVICEABLE BULLS* with good solid pedigrees.

No. 1—Double grandson of 40-lb. sire, from a 22.6 Jr. 2-yr.-old, 7 nearest dams average 23.7, all above 21 lbs. No. 2—Son of No. 1, A. R. O. dam, 15 nearest dams average 21 lbs. butter, 520 lbs. milk. All tested. No. 3—Yearling sired by No. 1, 7 nearest tested dams average 23.46. Priced for quick sale.

BULL CALF

Sire's dam, butter, 1 yr., 848 lbs.; her daughter, 1,055 lbs. Grandsire's dam, 987 lbs. at 11 yrs.; her full sister, 1,344 lbs.; another, same dam, 1,322 lbs. Dam, Miss Pietertje Alexina 3d, sister to Miss Pietertje Alexina 2d, 1,290.91 lbs. A dandy calf, priced right. Write quick to

McKAY BROS., - - CADDOA, COL.

WOODCREST SIR CLYDE

FROM A 33-LB. AND 970-LB. DAM

His 18 A. R. O. daughters, headed by a 30-lb. 3-year-old, and including 13 2-year-olds from 20 to 25 lbs., average 22.01 lbs. butter at 2 years, 10 months.

A son of the great Alma Clyde, whose yearly record of 970 lbs. butter from 22,560 lbs. milk, was debarred from 8th Ass'n prize, 1911-12, and who is dam of a 30-lb. daughter and three great sons. His sire's dam, former world champion from 7 days to 6 months.

Three daughters sold at auction the past season averaged $2,050 each.

Write today about one of his good sons from a yearly record dam.

HOME FARM HERD

(Established 1881)

W. B. Barney & Sons, Chapin, Iowa.

FOR SALE AND EXCHANGE

25 head of Holstein cows, 23 of which are high grade and 2 are registered. Also herd bull, a grandson of K. S. P. A., the fifty thousand dollar bull. This bull is from a 27-lb. cow. Most of these cows bred to this bull. All young cows and well marked, good heavy producers. Price $200 per head if the herd is bought together. Will take two good teams of draft mares or mules as a partial payment. Might consider a good automobile as a partial payment.

G. A. HIGGINBOTHAM, ROSSVILLE, KANSAS.

Revere Model Patriot Truck hauling milk at the University of Nebraska State Farm

PATRIOT

Motor Trucks

Where hauling is reasonably light — a ton or under—and you want speed — up to 25 or 30 miles an hour — the Revere Model Patriot will be just the truck you need.

Built for Country Roads

For all-purpose farm work —on the farm as well as on the road—getting a full load to market, up to two or two and a half tons—and standing up splendidly for the rough and ready farm work—you will find the Lincoln Model Patriot a wonderful value. It is probably the most useful all-around truck for farm work ever built.

For continuous and heavy hauling —getting good big loads of two and a half to four tons over the road day after day, Washington Model Patriot is a star performer.

Built for Farm Loads

The Patriot has standard wagon tread, plenty of road and field clearance, lots of power for mud, ruts, hills, plowed ground. Flexible construction enables it to stand strains, jolts, twists without injury, making it the ideal truck for field work. It will go anywhere a wagon will go, and many places a team cannot go.

If contemplating purchasing a truck at any time ask for our Book on the Patriot

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LX FORT ATKINSON, WIS., AUGUST 6, 1920. Number 3

RESEARCH WORK OF DAIRY DIVISION

A. M. LOOMIS

THE research work now in progress in the Dairy Division of the Bureau of Animal Industry in the United States Department of Agriculture has reached a point where there are indications of results of far reaching interest and commercial value to the whole industry of dairy farming. This statement has probably always been true of this work, since its inception in the first days of the Department of Agriculture, but it is especially true at this time, and it is worth while at this time to call especial atttention to it. The work of the Department has grown to such huge proportions that even the most successful and the most commendable single pieces of work are lost to sight, unless singled out, and commended by those most interested in them. In these days of measuring results by financial returns, purely scientific attainment is also often neglected. In the work of the Dairy Division at this time, there is both a sufficient scientific merit and a sufficient financial merit to warrant double attention.

Some of the most important of these projects are being carried on at the dairy farm owned and operated by the Dairy Division at Beltsville, Maryland, but a half hour's automobile ride from the Department buildings in Washington, D. C. Space here does not permit a mention even by name of many of the projects under way, but I wish to give just a brief survey of a few of them which seem at this time to promise most.

At the farm at Beltsville, there is a large herd of Holsteins, Guernseys, and Jerseys, extensive buildings and equipment equal to the best to be found anywhere, in addition to the special equipment needed in the many interesting experiments going on there. Among these herds are many animals of exceptional merit, of high type, and high production. Among these is the Holstein cow, Calamity Wayne Pauline 2nd, the champion butter cow of Maryland, with a milk record of 22,547 pounds of milk, and a butterfat record of 855 pounds in a year. Duchess Calamity Wayne is also a fine cow, with a 55-pound per day record with first calf. There are four daughters of Homestead King, a well known Minnesota sire in the herd, one with a 20,000-pound milk record and a 625-lb. butterfat record. Among the famous Jerseys is Little Gladis of Hillside, daughter of Hillside Torono, a Hood Farm Jersey sire, and three other daughters of this sire. H. T. Converse, formerly of New Hampshire, is herd manager.

The animals in this herd are being used in several of the projects to which reference was made above. One is a study of the principles of animal breeding. Another is a study of feeding dairy cattle, now in the seventh year. Still another is a study of the problems of housing and care of dairy cattle, now in its eighth year. A very interesting project is the farm dairy feed production project, and the silage investigation which has now been transferred into the Research Laboratory from the experiment farm.

A PROMISING TRIO

The project which, however, seems to have the greatest immediate scientific and commercial possibilities is the study which is being made by Professor E. B. Meigs and C. A. Clary, on the "Physiology of Milk Secretion and Nutrition of Dairy Cows", brief reference to which has appeared in an earlier article in Hoard's Dairyman. This was begun in 1915, and four bulletins have already been published covering the work done and discoveries made, but it has remained for the recent past to develop some items of the most definite and general importance. Even at the time this is written these can only be given in a general way.

During the past year discoveries went to the point where the dependence of milk production on a certain percentage of phosphorus in the blood was clearly established. From that scientific data Professor Meigs and his assistant started in to develop systems of rations which would provide the necessary phosphorus in the proper forms, and the most economical manner. Definite results are about ready for announcement on this phase of the work.

A study was made of the influence of feeding different rations during the dry period, and of no grain during that period, on the milk flow after calving, and rations have been worked out which have brought the milk flow of aged cows well up to, and in some cases beyond, the milk record of such cows in their best years. Careful analysis and study seem to point to the controlling influence of various mineral matters in the system, such as was indicated in the previous paragraph dealing with phosphorus. Calcium was the other mineral element the necessity for which was indicated by these studies, and the use of rations properly combining them, fed freely during the period just before lactation was found to have very strong influence on the milk flow for long periods thereafter. Disodium phosphate has been determined on as the form in which these minerals can be added to the feed in the most effective way.

Dr. Meigs is also carrying on at the same time a series of research experiments dealing with the kinds and qualities of proteins in the dairy ration. The special feature of all this work is the blood analysis which is accompanying every test. The fact that different proteins—that is proteins derived from different sources and therefore probably different in character—have different results in flow of milk, was the basis for this work. The investigation has developed that these different proteins produce varying qualities of amino acid in the blood. Further study disclosed the fact that the amino acid in the blood system of a healthy cow decreased as much as 34 per cent before and after milking. No appreciable decrease in amino acid is found in the blood of a cow while dry.

This demonstrated to Professor Meigs that the amino acid in the blood played a vital part in the process of milk secretion, and is the basis of the other work now going on to determine the cheapest and best sources of supply in the dairy ration of those protein feeds which will produce the proper amount of amino acid in the blood of the milking cow. At the same time the physiological study is being continued of the actual process of milk secretion, to work out if possible just the reasons for and the process of the various reactions in the work of the glands of the

Calf Club in Kentucky

July tenth, fourteen pure-bred dairy heifers were distributed to the children of Oldham County, Ky. The People's Bank of La Grange supplied the money for financing the club. The parents signed the notes with the children and deposited them with the bank; the notes drawing interest at 5 per cent until maturity in three years. The heifers range from six months to a year in age, and cost approximately $200 each. Half of the heifers are Holsteins purchased from Coldstream Farm, the other seven are Jerseys and were purchased from R. J. Shipman.

Merrill Smith was elected president of the Oldham County Calf Club and Mamie Iris Hitt was elected secretary.

This is the largest calf club that has yet been organized in Kentucky and credit for it is due to county agent, J. N. McCarty, and to the following breeders of dairy cattle of the county: Roger Hitt, Fred Von Allman, C. W. Smith, W. W. Hampton, and J. W. Howey.

The calves are high class and it is planned to keep each one in Oldham County so that each may find a useful family of dairy cattle that will add to the fame that this county has gained as a progressive dairy community. The farmers there were the first to organize a cow test association and as a consequence of their leadership three other Kentucky counties now have associations.

J. J. HOOPER.

Here's evidence of a back to the farm movement: About 4,000 disabled soldiers, sailors, and marines, according to a recent census, are taking agricultural training under the federal board for vocational agriculture.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

Dairy John's Philosophy

I could stock all the farms in twenty-seven states with farm machinery, if I could only bring back to life the stuff that rust has ruined.

Clearing a ball-room floor, between dances, is not as difficult as clearing one acre of land that has never known the plow before.

No chariot that ever roamed the roads of ancient Greece could compare with a sturdy truck, marketward bound, with the morning's milk.

The Country Trout Stream

The digging for bait by lantern-light.
The start at five a. m.
The hunger at five ten.
The long, hard walk through wet woods.
The first glint of sunlight on the stream.
The whispered advice.
The wriggling worm on the dark waters.
The first disappointment.
The continuation of it.
The three-mile down-stream jaunt.
The sudden appearance of the game warden.
The halting excuses.
The asking to see the license.
The admission that there ain't none.
The summons.
The derisive laughter when you reach home.

"What is that little place?" asked the city visitor, on the big dairy farm.

"A smoke house," was the answer.

"You'll never get me in there with my cigar," went on the visitor, "it's too small and dark. I suppose it's the farmer's way of preventing forest fires."

A Fair Comparison

The calf was skittish as could be,
It kicked the bucket in the air,
It ran like blazes, far and free,
And made the farm hand fellows swear.
But say, youth always has it's fling,
Boys do the same, despite your call.
Why blame the young for anything?
The kindred truth is true of all.

The cow gets peevish, frets a bit,
She flicks blue-bottles with her tail,
And milking! Well, you stop at it,
And catch the overturning pail.
But, say, each one of us we find
One day of grouch and discontent,
We kick and leave a trouble-trail
When, mostly, only good was meant.

The bull snorts fire and rules th' field,
We dodge behind a sheltering tree.
The bark from many a birch is peeled,
And swift tornado rage is free!
But, then, some men we know, give vent
To rage, and leap the pasture bars.
For all life's sweet, sublime intent,
We make the quiet world see stars!

The country mothers are the real powers of the land. Every time you see a really great man, if you look hard enough, you'll find, somewhere, a modest, tender, loving little country woman, as the mother, away back, hiding, modestly.

"What happened to that lightning rod agent?"

"Didn't you hear he was killed by lightning during that last big storm on Hill Creek?"

"Any summer boarders this year?"

"Yep, eight. What'll you ask to take 'em off my hands for the rest of the season?"

There's Just One 100% Efficient

CREAM SEPARATOR

And That's The

DE LAVAL

For Forty Years

The World's Standard

There may be a half-dozen plows, wagons, tractors, autos or other farm equipment to choose between, but no would-be imitator or utilizer of expired De Laval patents has yet produced a cream separator comparable with the De Laval.

First in the beginning, De Laval machines have led in every step of cream separator improvement and development. Every year has presented some new feature or betterment, and the 1920 machines are still better than they have ever been before.

If you haven't seen or tried a new 1920 De Laval machine, any local agent will be glad to afford you the opportunity to do so.

If you don't know the nearest De Laval local agent simply address the nearest main office as below.

MILK FAIRY PAGEANT

L. R. GADDIS, INDIANA

SPIRIT OF GOOD HEALTH AND ONE OF THE FAT CALORIES

QUEEN OF THE FAIRIES CALLING FAT AND HER CALORIES FROM THE MILK BOTTLE

MILK is not a beverage but a food. To drive this statement home, Miss Orpha Cole, home demonstration agent in Tipton County, Indiana, and a corps of capable assistants staged the Milk Fairy Pageant in Tipton Park, June 25.

A more beautiful day in June could not have been selected, a more ideal spot for the Milk Fairies to tell their story could not have been found. In spite of the busy season, two thousand people assembled to witness this beautiful pageant. A huge milk bottle, nine feet in height, painted yellow and white to represent the proportions of fat, was in the middle of the natural stage. Near this was the orchestra which was composed of a piano, cello, violin, and flute, played by young girls.

"Johnny", who was not fond of milk, was not one of the Boy Scouts, didn't care for games that the average boy cares for, and was not a good student, was called by his mother. He didn't want to get up, he didn't want to drink his milk, he didn't want to go to school so he went back to sleep and dreamed. The pageant was his dream.

The door of the big milk bottle opened, and out walked the Queen of the Milk Fairies, dressed in white and carrying a silver wand. She called forth the protein calories which were the Boy Scouts. They put on a beautiful drill and a snappy foot ball game. The Queen again waved her magic wand and out walked the fat calories. Little tots four and five years old, dressed in creamy crepe paper dresses to represent cream, gave a folk dance.

Vitamines of milk, dressed in blue and green crepe paper; sugar in white with red stripes running round like stick candy; mineral matter dressed in white; and water in green, were then called forth.

The folk dances, the catchy songs telling the story of the different food nutrients had their effect upon Johnny. He wanted to be a strong manly boy, wanted to be a Boy Scout, play foot ball and be a good student in school. He appealed to the Fairy Queen. She called all her fairies and, in their presence, Johnny declared that if milk would do for him all they claimed, he would forever after drink milk.

The staging of the pageant was ideal. Not only was the audience entertained, but the two hundred children who took part in the pageant had a lesson they could not have received in any other way, and each child and parent went home with the determination to "eat more milk".

Upon request, the pageant was repeated a week later in connection with the band concert, the city placing special wiring in the park for the staging.

Miss Cole has been instrumental in placing the hot school lunch in many schools throughout Tipton County, Hot cream soup, chocolate made with milk, and creamed dishes have been served. Later she will conduct a milk campaign throughout the county to encourage a greater use in the preparation of the daily meals, especially in families where there are children.

BOY SCOUTS—EVERY ONE OF THEM DRINK MILK

EXECUTIVE SECRETARY OF THE TUBERCULOSIS ASSOCIATION TELLING WHAT MILK WILL DO IN THE WAY OF BUILDING UP TUBERCULAR PATIENTS

A County League Meeting

H. H. LYON, NEW YORK

COUNTY league meetings are still held, commonly four times a year. It has been apparent all along that close touch of the members with the activities of the head office is of great importance. The county league meeting is a strong link in the chain if it is made strong. At the county meeting some one, either a director or county president, is expected to make a fairly complete survey of the work of the past three months. The next step is to get this to the members in the local leagues. The way to do this is not always clear. This is something that we should be more interested in doing, but it is not my purpose to discuss this now.

What I desire at this time is to mention some of the things that have been taken up at recent county meetings for if it goes into Hoard's Dairyman it reaches many league members and may be of interest to those in other milk producers' associations.

The past three months have been a history making period in the league. The worst grapple of our history has been made and won. It has not attracted the attention that the so-called strikes have, but the fortunate thing about it is that a decision was reached and there was no strike. Last year the dealers came on with a plan for buying milk, the price to be based on the price of butter and cheese with certain minor items to modify these prices. It was tried last summer and with satisfaction to dairymen for the most part although it was hardly thought to be a satisfactory plan to tie up to indefinitely. The dealers then wanted to make a full year test of it and this was agreed to, the last half to the detriment of the farmers. Dairymen lost money for several months at any rate. Possibly they might on some other plan. There certainly was a change in market conditions.

Then came March 7th to 27th. My understanding is that the Chicago producers had a taste of certain dealers' methods about that time and that they were none too well pleased. These same dealers it is said thought to do up both the Chicago dairymen and those here also. My information is that the farmers stood solid about Chicago and they did here.

Through their committee the dealers came on with a new plan for determining the prices. It made prices lower and it took only part of the milk. The plan had to be refused. All milk must be sold. That is fundamental. It is the reason for the co-operative plants that are now being constructed and some operated. If dealers take only what they choose and leave the remainder on the farmers' hands the organization is weakened if not brok-

(Continued on page 80)

Tractor Ignition Difficulties

R. U. BLASINGAME, PENNSYLVANIA

THE tractor engine will run with leaky valves, poorly fitting piston rings, loose bearings, etc., and so on, but when the ignition goes bad the jig is up. There is no half way point with ignition; it is or it isn't.

In an investigation conducted by the United States Department of Agriculture among over 2,000 farmers who used tractors, it seems that most troubles come from the magneto, and the spark plug runs a close second. It is apparent then, that ignition offers most difficulty in tractor operation. In fact, the tractor manufacturers say that they have more calls for service in connection with the ignition equipment than with any other one thing. It is really a very provoking and expensive thing to have the threshing crew standing around with nothing to do but work up an appetite because of a loose connection or an oily carbon brush which prevents the tractor from operating correctly.

To prevent such delays occasioned by trifling troubles, the farmer or his tractor operator has got to acquaint himself with the various troubles and remedies which come to the tractor. An instruction book comes with the tractor and contains information enough to assist the average man in the adjustment, proper care, and operation of his machine. But too often the instruction book may be found in the tool box or lying on the shelf in the tractor shed, unopened, six months or a year after the tractor has become a part of the farm equipment.

The most essential things for success with the magneto are to keep it clean, dry, and lubricated with the *right kind* and *right amount* of oil. The bearings of the magneto are the finest and most delicate of any others about the tractor and they require about 2 or 3 drops of a thin, light, high grade oil each week when the tractor is in constant operation. Probably sewing machine oil is the best grade to use. Ordinary cylinder oil contains too much gum and it is too thick to be used for magneto lubrication. It also is of a mineral origin and has the quality of conducting electric current.

If the engine fails to start or if a cylinder or two is missing, look first to the easiest thing to remove, the spark plug. The porcelain may be broken, or the points may be too close or too far apart or the plug may be full of carbon or grease. Test it by laying it on the engine with the wire connected. If a spark fails to appear at the plug when the engine is cranked, then the trouble may be a loose connection at either end of the wire leading from the magneto to the plug. Or, the trouble may be caused by a broken wire P, Figure 1, or the insulation may be worn or burned. Look at all such places before laying the blame on the magneto. Keep the ignition wires off of the exhaust pipe; the rubber insulation burns readily.

Now, if the trouble is not in the parts mentioned, it must be in the magneto. Then the easiest place to get at is in the distributor cover plate shown at B, Figure 1. This plate is generally held on by two spring clips. In this distributor cover there are five small carbon brushes one at the center and one for each spark plug wire. These carbon brushes are held against the distributor D by fine coil springs. These springs may become weak or the brush may, for some reason, stick in the socket in which it fits. In this case it will not be held against the distributor. If the spring is taken out and stretched a little, it may hold the brush against the distributor.

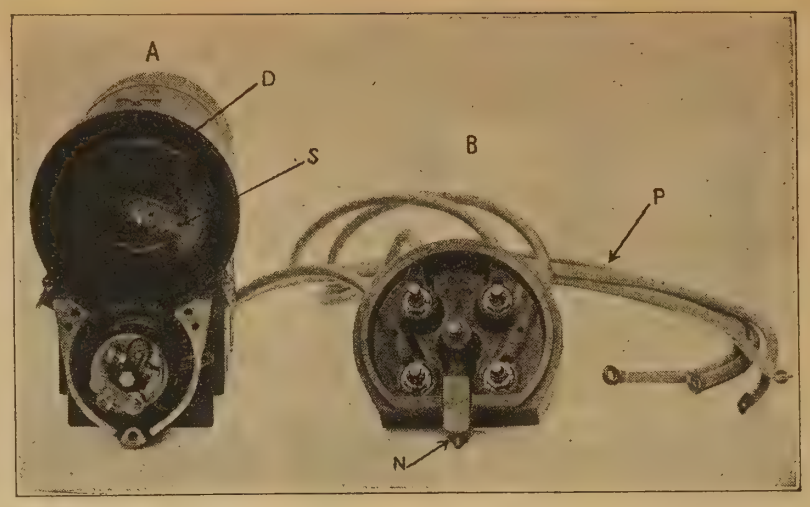

Fig. 1.—N, collector brush; P, broken wire; B, distributor cover plate; D, distributor; S, Brass Segment.

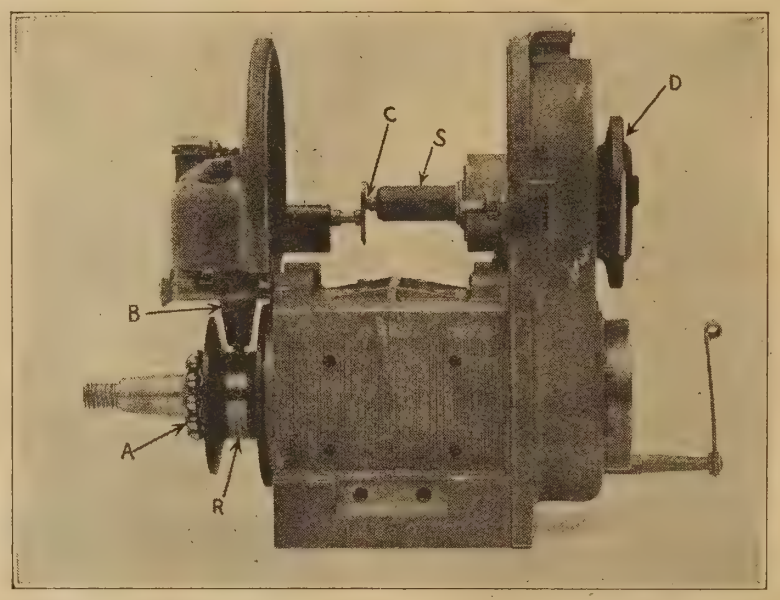

Fig. 2.—R, collector ring; B, collector brush; A, ball bearing; C, carbon brush; S, revolving spool; D, distributor.

If the springs are all right, the brush may be dirty or may have a layer of grease on it. In this case, smooth it up with a fine file or emery paper. The brass segment S may be dirty. It may be cleaned by washing with a rag moistened with some of the oil which is used to lubricate the magneto. In case no trouble is found in the distributor brushes, the difficulty may be in the collector brush N, Figure 1. This is a carbon brush and is held against the collector ring R, by a fine coil spring similar to the brushes in the distributor cover which has been mentioned. Here is where a good deal of the trouble comes. Another view of this collector brush is shown at B, Figure 2, resting against the collector ring. The collector ring R is sometimes called the "slipring" in some of the instruction books.

The ball bearing A, is one of the places to receive oil and consequently the ring R and collector brush B are likely to become covered with oil, especially if too much lubricant is used. If on examination this brush is found dirty, it should be brightened slightly with a fine file or emery cloth. The collector ring may be cleaned with a rag moistened with a light oil.

After the current is collected at the slipring it is transferred through the carbon brush C to the revolving spool S to the distributor D. The brush C is constructed as the other brushes mentioned and may become dirty and fail to transfer the current. To get at this particular brush it is necessary to remove the magnets.

Care should be used in removing the magnets; first mark them so that they go back as they came off; second, as soon as the magnets are removed, place them together as shown at M, Figure 3; third, never pick up screw drivers, wrenches, nails, etc., with the magnets because any piece of hard metal will absorb magnetism from the magnets and weaken them.

If the tractor is to be stored for any great length of time the magneto may be removed and kept in a warm, dry place. Before removing the magneto mark the coupling on the drive shaft in order that the magneto may be placed back in the correct time on the engine. Also, put a tag on each wire and number the tags according to the cylinder, 1-2-3-4, beginning at the end where the engine is cranked.

Before replacing the magneto, attach an insulated wire to the binding posts of the distributor and have one end near some metal part of the magneto about like the spark plug gap as shown at P, Figure 4. Revolve the magneto by hand and if a spark occurs for each binding post, the magneto is in good shape.

It is a good practice to let the magneto alone until something goes

(Continued on page 96)

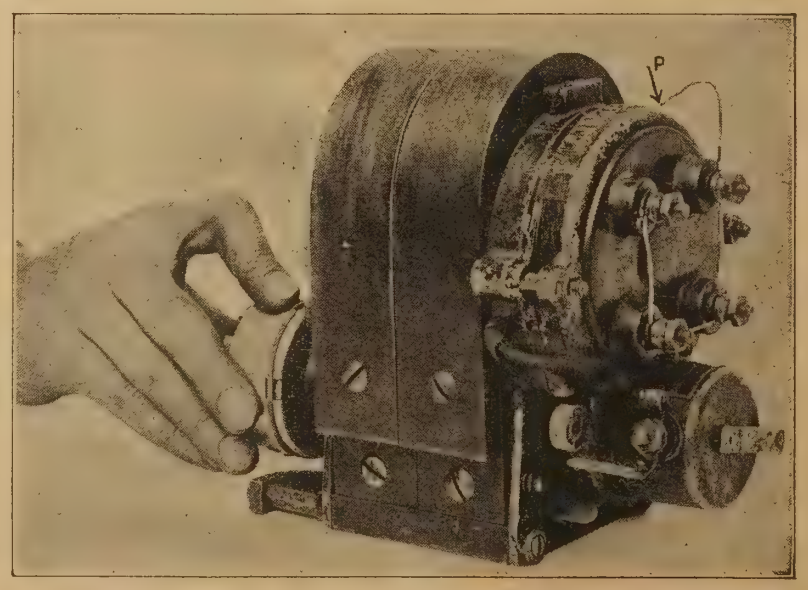

Fig. 4.—Testing magneto. Each post should give spark at end of wire, P, if in good order.

Experiences of a Cow Tester

EDWARD H. ZIEROTH, ILLINOIS

THE cow tester must take the good with the bad, and if he wishes to enjoy his work he must make up his mind to meet all comers. He must remember that he is a missionary, and no missionary that is too particular will ever get anywhere. If he believes that he has finished his duties when he has balanced a few rations and whirled a few bottles in his tester, he has missed his calling. The worse the farm and the farmer the greater his opportunities for doing good, and also the greater his job. He alone of all the extension workers gets to know the farmer in his home, the place where all men show up their true colors. A man might wear a red undershirt all his life and yet you would never know it until you had spent a night or two in his home.

I enjoyed my work as a cow tester because I studied each man and each family individually. If a man was up-to-date in his methods I was glad of the fact and did all I could to keep him at the top. If a man was backward in his methods and did not have as good a home to live in as the rest, I did not cuss my luck for having such a member in my association, but I went after him as well as I knew how and tried to make him see the advantages of better methods. If a man is in a rut, it is his family that suffers most. If the tester can not stand him for one day a month, it is his duty to help that man out of the rut.

The first month or so around I was very careful not to upset the regular run of affairs of the farm and household. Most farmers and most farmers' wives believe that there is a lot of work connected with keeping a cow tester. The first month I made it a point to slip in with as little commotion as possible, do my work as quickly and with as little muss as I could, and then slip out again in the most quiet way I knew how. I wanted the farmer and his wife to say, "Why, that was no trouble at all, I expected it to be much worse than that".

I believe that much of my success was due to the way that I conducted things that first month. After I became acquainted and the people had become used to my ways, I began making suggestions. If the first one worked I made the second one a little stronger. I tried to have the idea develop in the man's mind as if he had thought it out himself. Each man presented an individual problem. The more hard headed he was, the more fun it was to me to get any of my ideas across.

But the members of my association were not hard headed as a rule. I'll put them up against any equal number of farmers in any part of the United States. They always treated me as well as they possibly could. I made myself one of the family as soon as possible and as far as my association reached into each of three counties, I was always called by my first name, from grandma down to the little fellows just learning to walk.

I have had some hard knocks, just as all testers get, but I never allowed myself to grow pessimistic. No matter how hard the knocks were on one day, the next always brought enough good things to make up for them. Most of the discouragement comes the first month around when you come to the fellows that do not know whether they want to come into the association or not. After one has visited each place at least once, matters go more smoothly. If the tester is of the right sort, he ought to have no more difficulties on his third trip around.

I found that after I had been on the job for several months the people were planning many of their parties and good times for that part of the month when I would be around and able to get in on them. I was never lacking for a good time. If there were no parties, or weddings, or what-not, the young people were always anxious to have me go with them to shows and dances in neighboring towns. I certainly had the opportunity of becoming acquainted with a large number of people.

Although most of the housewives denied the fact, I am sure that all of them put on their tables a little bit extra when the cow tester was around. At least I have never had such good meals before or after being on that job. It seemed that every day was Sunday. Many a young rooster crowed his last crow the day I was on the farm. Supper was always made exceedingly good because that was my first meal there that month. Breakfast was made a little better; well, just because they wanted it to be good. Dinner was always well touched up because they had more time to get it ready and because they had to go some to beat the other two meals.

THE COW TESTER'S JOB

Whirling a few bottles is not the big part of the work of the tester. He is a missionary of better dairy farming and has a large opportunity for service. Accuracy in doing the work is important, but there are other things that go a long way to make the tester a better man and the farmer a better dairyman.

I always had a good place to sleep. Once or twice when there was company and the house was crowded, I had to sleep with the hired man, but he was a good fellow in each case and we enjoyed each other's company.

I enjoyed going to every place in my association. Some I liked better than others, to be sure, but as the time came to go to each place I was always anxious to see the people and find out what had taken place in the herd and home since I had been there last.

The tester must never let up on his work. If he lets up on his duties for but one day, it is but one day of the month for him; but for the man whose herd is being tested that day it is the only day in the month when he can get any good out of the tester. No one will remain in a cow testing association just for the sake of belonging to one. If a man is indifferent he must be educated up to the point where he does care. Get him out in the barn and show him how this cow is earning a dollar a day and that one is earning but ten cents. Talk money to him and he will understand.

I was greatly surprised the first month around to find that many men could barely tell their cows apart, much less distinguish them by names. Such men were inferior dairymen. It was always the case that where the man was best acquainted with his cows, he was always the one with the best producing herd. In one particular case a herd that was almost a losing one to begin with, turned out to be one of the most profitable ones after the man learned to know his cows by name and was feeding them according to their production. One herd I found headed by a Hereford bull. That was a shock to me, for I had always thought of the Hereford as the poorest milk producer of all. That was one place where I made a suggestion the first month. I succeeded in getting the Hereford bull replaced by a good grade. Now that same herd has a fine pure-bred bull and several of the finest females in the country. When the tester finds such changes taking place he feels that the time he has spent has been worth while. Whoever the tester may be, I am sure that he gets out of his work as much as does the farmer. I would not exchange my year spent at cow testing work for the best year I had at the university.

Successful Community Efforts in the Show Ring

A. O. COLLENTINE, Extension Specialist, Wisconsin

THE exhibits of cattle at county fairs sometimes reflect badly on the cattle grown in the community. If the prospective buyer were to judge the stock of Green County, Wisconsin, by its showing at its local fair up until last year he would never have tarried long there to satisfy his wants.

Too often the county fair is overlooked as a place to further a breed's interests. This was the case at Monroe, the county seat of the greatest foreign cheese producing county in the United States. Here was a community whose fair vied for first place among county fairs as to attendance, horse races, and general farm exhibits but whose cattle exhibits were shamefully neglected. Year after year the stalls were filled with poorly fitted and ill chosen stock for exhibit. The breeders themselves found little to interest them by going through the barns and were wont to criticize those who had exerted some effort on short notice by the fair officers to make some sort of showing. Occasionally an outside breeder was induced by the fair officers to bring his herd to "fill in" so as not to have the barns empty. Yet with over two hundred breeders of pure-bred Holsteins in the county there wasn't a pair of animals in the entire show ring at the local fair that measured up to the type of stock being bred in the county.

FIRST PRIZE TWO-YEAR-OLD

With a program of work outlined and the fair some months away the committee composed of Albert Babler, Jr., president, and the secretary of the local club, set out to locate among the breeders in the county fit subjects for the different classes. The idea first of all was not to overload any one class but to be sure of enough animals to properly fill the entries and encourage competition. Double the number in most cases were selected so that a "weeding out" later could be brought about and also allowance made for withdrawals. The willingness to fit and show a few head on the part of the owners was truly marvelous. It is rarely possible that any one breeder is in a position to fit and show his entire herd unless he is a professional show man or makes a business of showing. On the other hand, it takes much valuable time for the average breeder to fit a number of animals just to show at one fair. It's a question whether the returns would reflect in increased sales later from his herd. It's not an argument for him to neglect this opportunity to display some of his stock as a means of making his fair a success and to pay a debt that he owes to his favorite breed. A good representative or two from his herd properly fitted and shown by him bespeaks

(Continued on page 96)

FIRST PRIZE COW

WASTE OF WOMAN POWER MENACE TO RURAL LIFE

The waste of woman power is one of the greatest menaces to the rural life of the nation, according to deductions that specialists of the United States Department of Agriculture draw from a farm-home survey conducted in the 33 northern and western states. The survey was made under the direction of Miss Florence E. Ward, in charge of extension work with women, Office of Extension Work, North and West, States Relations Service. The records cover 10,015 farm homes, averaged by taking typical communities of the counties in which the survey was made. Much of the information was gathered personally by home demonstration agents, who are the field representatives of the United States Department of Agriculture and the state agricultural colleges.

Miss Ward points out, from the facts shown by the survey, that a reasonable amount of planning and well directed investment in modern equipment for farm homes would prevent a large part of this wastage of the energy of the nation's rural home-makers. "This is a serious matter," she continues, "because we have a live national problem now in working out the economics of country living in such a way as to make them satisfied to stay on the land and help build it up. Perhaps the greatest factor in bringing this about will be the healthy, alert, and expert home-maker who will see to it that part of the increased income from the farm goes into improvement of the home. At a time like this, when the dearth of farm labor is a limiting factor in production, it is very doubtful business policy for farmers to use increased income to buy more land instead of using a part of it in raising standards of living so that women and young people will not want to go to the cities in search of attractive living conditions and amusement."

Picture of Farm Woman's Work Day

The survey discloses a number of the reasons why many women do not find farm life attractive. The working day of the average farm woman, as shown by the survey, is 11.3 hours, the year round. In summer, it is 13.12 hours. And 87 out of each 100 women have no regular vacation during the year. On the average, the farm woman can find only 1.6 hours of leisure during the summer and only 2.4 hours in winter. Half of the farm women are up and at work at 5 o'clock in the morning.

Four per cent have water in the kitchen, but the other per cent must go to the spring or the pump to bring the water for cooking breakfast. Thirty-six per cent help with the milking. On the average, the farm woman has a 7-room house to keep in order. Seventy-nine per cent have kerosene lamps to trim and fill. Ninety-six per cent do the family washing, about half of them having washing machines and the other half doing the work with tub, wash-board, and boiler. Twenty-six per cent have gas or electric irons to make more comfortable the task of ironing Ninety-two per cent do some or all of the family sewing. Garden work is done by 56 per cent, 94 per cent make all or part of the family bread, and 60% have churning to do. Eighty-one per cent of all poultry flocks are cared for by women. One-fourth of the farm women help to feed and bed the live stock, and 24 per cent of them spend over six weeks in the year assisting with some part of the field work. All of this is in addition to cooking the family meals and caring for the children.

This, of course, is the dark side of the shield. It does not take into consideration the many compensations that come with the woman's daily round of work for the comfort of her family, and anyone who has experienced the satisfaction of living in the open country knows that the average farm woman is more fortunately placed than her average city sister. But the task is sufficiently grinding, as Miss Ward says, to send the farm woman to bed "breathing a prayer that her strength may be equal to tomorrow's duties."

Labor-Saving Equipment Important

What is to be done about it? The Department suggests some very definite things. "The interest of the Department of Agriculture in the returns from these studies as to labor, working equipment, and compensations of the farm woman are as practical," says Miss Ward, "as its interest in farm studies regarding labor, machinery, and crop returns, and for the same general reason." The farm woman's working hours might be shortened, she continues, if the principles of modern business were applied to the farm home. Running water for the 61 per cent who now must carry water, and bath rooms for the 80 per cent who now have none are other things that would lighten the woman's labor and add to her comfort and contentment. Labor could be lessened if the farm house were as well equipped as the up-to-date barn, which the farmer looks upon as so much currency with which to buy efficiency. The installation of modern lighting systems would release some of the time of the women in the 79 per cent of homes where kerosene lamps are used. The initial cost would be small when weighed against convenience and comfort. The installation of heating systems would release some of the time of the 54 per cent of women who care for two coal or wood stoves.

"As power on the farm is the greatest of time and labor saver for the farmer," Miss Ward's report says, "so power in the home is the greatest boon to the housewife." Forty-eight per cent of farms covered by the survey reported power for operating farm machinery but only 22 per cent have this advantage for the home. "That," says Miss Ward, "is a singular fact when we consider that frequently it is a simple matter to connect the engine used at the barn with the household equipment." The washing machine is another labor-saver. Selling the cream to a creamery wherever possible instead of churning it at home is still another. In short, the same sort of intelligence and a fraction of the money applied to making field and barn work convenient would, if applied to the home, save untold drudgery to the women of the farms and would add both to the profit and the comfort of farm life.—U. S. Dept. of Agriculture.

New Guernsey Champion in Indiana

SWEET BELL

Sweet Bell, a Guernsey owned by Killarney Farms, Indiana, has recently completed a record of 13,688.9 pounds milk, 710.93 pounds fat, in Class AA. This performance not only exceeds the previous state Guernsey record by a wide margin, but it entitles the cow to tenth place among the Class AA leaders. The sire of the new state champion is Yeksa of Busy Bell, a son of Skeezicks. Her dam while not a tested cow has two Advanced Register daughters.

Credit is due to John McMinn, the Killarney Farms herdsman, for the champion's splendid performance during her final months. With true Scotch thoroughness "Mac" completed the last five months of the record.—AMERICAN GUERNSEY CATTLE CLUB.

Guernseys Employ Musser

Karl B. Musser has resigned as dairy extension agent for Wisconsin to become a field man with the American Guernsey Cattle Club. He begins his new work at once.

Mr. Musser is Kansas grown and a graduate of the Kansas Agricultural College. In 1914 he obtained his master's degree in dairy husbandry in the University of Missouri under Professor C. H. Eckles. Following graduation he had charge of dairy extension in Connecticut for Storrs Agricultural College, where he was very successful. His work in Wisconsin has been equally effective. He will travel from the Club office and should accomplish worth while results in the eastern territory for Guernseys.

Hens lay when fat—not too fat—and stop when thin. Look for fat on the pelvic bone; if you find it the hen is fat, if you don't the hen is thin.

25 Cords a Day

Easily Sawed By One Man.
Easy to move from cut to cut. Make big profits cutting wood. Cheap and easy to operate.

OTTAWA LOG SAW

Does 10 men's work at one-tenth the cost. Makes work easy. Engine can also be used for running pumps and other machinery. Saw blade easily removed. Write for our low price. Cash or Easy Payments.

30 Day Trial 10-Year Guarantee

Ottawa Mfg. Co. 1389 Wood St. Ottawa, Kansas.

This Tells the Story

I have used a set of Dayton Airless Tires, getting 44,000 miles out of the front and 20,000 miles out of the rear tires, the difference in mileage being due to my overloading my Ford Touring Car by hauling three barrels of oil constantly.

The satisfaction of knowing, that when a person starts, he can get somewhere without distress of both body and mind by punctures, blowouts and loss of time, is a compensation in this age of progress, for any difference in price. The fact is, in the long run, the cost of Dayton Airless is about half the pneumatic cost.

Harold T. Smith,
Assistant Treasurer,
Humble & Gulf Coast Oil Co.

Dayton Airless

30 X 3
30 X 3½
31 X 4
SIZES

No Tube
No Air
No Trouble

Puncture-Proof and Easy Riding

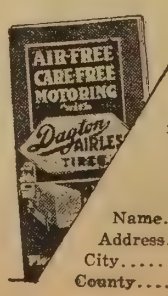
Dayton Airless Tires will free you from all tire trouble. They are used extensively on passenger cars and delivery cars.

They prevent delays, save time and save money. On the crowded streets of cities or on lonely roads far from help, Dayton Airless Tires can be relied upon. They never puncture, never blow out, need no pumping and no patching. Piers of live rubber separated by air spaces absorb all jolts and make them easy riding.

Equip Now with Dayton Airless

If you drive a Ford, Maxwell, Chevrolet, new Overland Four, or any car using 30x3, 30x3½ or 31x4 inch size tires, equip with Dayton Airless. They are guaranteed 8,000 miles, but records of users show two, three and four times that mileage.

Mail the coupon for booklet and price list. Investigate the uninterrupted service and lasting economy of Dayton Airless equipment.



A Splendid Opportunity

is offered to substantial business men in territories where we have no dealers at present. Previous experience in the tire business is not necessary. Wire or write.

Use More Milk

There is no article in the human dietary so little understood as milk.

Milk is a real food, just as much, and even more so, than meat. Milk contains all the food ingredients of meat and, in addition, contains a vital food substance indispensable to growth and health. Milk is a perfect food, and a complete food. It is also a protective food, in that it tends to make good the deficiencies of other articles of the diet. Its protein, or muscle-building ingredients, are ideal in quality, its sugar is of the best, its fat is superior to the fat of any other food because of the presence, in large quantities, of this vital substance called fat soluble A, so essential to human welfare, and its mineral matter is most wonderful in promoting growth and repair and stimulating the physiological functions of the body.

The United States government says:

Milk is the best food we have. Give your children milk, a quart a day for every child if possible, a pint without fail. Plenty of milk will help you give all your children, both big and little, the chance for health they ought to have. Buy more milk and less meat and your family will be better fed.

Milk is an economical food, too, one quart being equal in food value to eight eggs, or four-fifths of a pound of beefsteak.

The accompanying chart shows how well it compares with other staple articles of the diet, such as beefsteak, ham, chicken, and the much-talked-of beans.

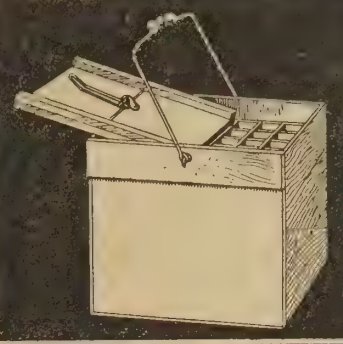
For milk to be as expensive as beefsteak, it would have to sell at 30c a quart, while if it cost proportionately to eggs, it would sell for 40c a quart, when eggs are 60c a dozen. If milk were sold, in proportion to the selling price of tomatoes, it would sell for exactly $1.00 a quart when canned tomatoes sell at 15c per pound.

These comparisons do not take into consideration the additional vital substances to which we have previously referred, which promote growth and health, neither do these comparisons take into consideration the valuable and superior mineral matter found in milk.

Suffice to say milk is a food. It is economical and everyone, both old and young, should use more milk.—Publicity Department, National Dairy Council.

Students' National Contest Judging Dairy Products

There is nothing in the Annual National Dairy Show that takes precedence, in importance to the industry, over the students' products judging.



The standing given to our industry by the findings of the leading scientists of the world, in their nutrition experiments, that dairy products lead all human food, makes it extremely incumbent upon the dairy people that they turn out this vital food in a manner calculated to be an aid in encouraging its consumption in all forms. Therefore, to give the young men attending the agricultural colleges an opportunity each year to dig in to the great subject of the market package of dairy products, and to pass upon many samples of manufactured and raw products to supplement their school work in a large way, the National Dairy Show holds an annual competitive judging contest of dairy products under the supervision of United States Dairy Division experts, believing it affords a training, and gives an experience that should develop practical confidence in their judgment, and build men who will exert an influence in the development and improvement of manufacture and marketing our products.

The Dairy Products Contest will be held this year, Friday, October 8th. The awards for this contest are as follows: The J. G. Cherry Company of Cedar Rapids, Iowa, present a silver cup to the team receiving the highest rating in judging butter. Hoard's Dairyman presents a silver cup to the team receiving the highest rating in judging cheese. The J. B. Ford Company of Wyandotte, Michigan, will award a silver cup to the team receiving the highest rating in judging milk.

The National Dairy Association gives a beautiful silver cup, which must be won three times to be held by any one school, to the team receiving the highest rating on judging of all products, and, in addition, the association offers a gold, silver, and bronze medal to the three highest individual students receiving the highest ratings in judging all products.

This contest, and the cattle judging contest by the students, and the junior cattle judging contest by boys and girls who have not yet reached college, will afford three rich days to the coming generation at this year's Show—7th, 8th, and 9th of October. Parents and relatives of the boys and girls who are looking forward to these great events, should be rendering them every help and encouragement, as it means very much more in reality to their young lives than making the base ball or foot ball team at their school, which we do not at all decry but most heartily endorse. However, when we speak of the real things of life, such a contest as the foregoing at the National means most.—National Dairy Show.

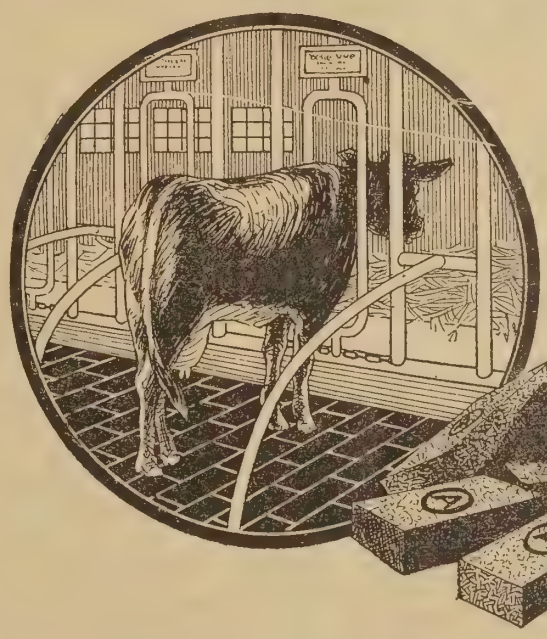
You can safely put all your Eggs in one Basket if you use

FARMER'S FRIEND EGG CARRIER

Made of wood, nicely painted and finished, very strong and durable and will last for years. Has adjustable lid and automatic lock. Regardless of quantity of eggs in carrier, they are held firmly—will not jostle and break. Each carrier holds 12 doz.

When eggs are delivered fillers can be folded, placed in bottom of carrier, which can then be used to take home groceries or other purchases.

Prices F. O. B. Chicago



Each	$ .80	4 doz.	$8.80 per doz.
½ doz.	4.50	8 doz.	8.70 per doz.
1 doz.	8.90	12 doz.	8.60 per doz.

Above prices guaranteed until September 4, 1920.

The Correct Material for Stall Floors

The principal qualities which emphasize the value of Circle A Cork Brick for stall floors in dairy barns are warmth, resilience, nonslipperiness, sanitation and durability. Cows can stand or lie on them—*even in bitter-cold weather*—in comfort and safety without danger of chilled udders. Being nonabsorbent of liquids, they are easy to clean and do not retain odors. And their natural toughness assures long wear.

Circle A Cork Brick are made of ground cork and refined asphalt—nothing else.

Circle A Cork Brick
FOR ALL STALL FLOORS

Naturally, you want a copy of the 28-page book, "Better Stall Floors," because it tells in an interesting way of the success dairymen in every part of the United States are having with Circle A Cork Brick. Send for a copy today—there's no charge for it.

Armstrong Cork & Insulation Company 112 Twenty-fourth Street, PITTSBURGH, PA.

The Prosperous Dairy Farm

WIDE-AWAKE dairy farmers are following the advice of expert authorities and are raising heifer calves. Being good business men, they are developing these calves into profitable cows with the least possible expense. They accomplish this by feeding fresh, warm skimmilk. A cream separator is the only way of securing the sweet, warm skimmilk for feeding, and saving all the butter fat.

Primrose Cream Separators make the dairy farm more prosperous. They have many features which save cream, lengthen the service of the machine and make it easy to operate and care for. See your nearest International dealer or write direct for catalog. Built in four sizes with capacity varying from 350 to 850 pounds of milk per hour.

Association Notes

Vermillion—Champaign County, Illinois:—Owing to flies and short pasture, the average of the association is very low this month. Only one unprofitable cow was milked during June as compared with 31 eleven months ago. The J. B. Raub herd could not be tested this month and the association report, therefore, is not up to the average held in the past.

Southern Blair County, Pennsylvania:—In June market milk testing 4% sold for $3.42 per cwt., 4 cents being paid for each point above. Milk retailed for 14c per quart, butter for 70c per pound, and cheese for 45c per pound. Corn and cob meal is rated at $60 per ton; Larro, $80; Union Grain, $80; bran, $50; oil meal, $75.

Troy, Pennsylvania:—June market milk testing 3% sold for $2.83 per cwt. Feed prices are: oil meal, $3.70 per cwt.; hominy, $4.15; bran, $3.15; Hi-test, $3.70; Unicorn, $4.10.

Rome, Pennsylvania:—Three per cent milk sold for $2.83 per cwt. in June. Butter retails for 60c per pound and cheese for 40c per pound. Pasture is rated at $3; hay, $20 per ton; soiling crops, $8; corn stover, $10; silage, $6; bran, $65; linseed meal, O. P., $80; cottonseed meal, $90; gluten, $75.

Bradford County, Pennsylvania:—The highest cow for the county is a grade Holstein owned by C. S. Chaffee of the Laurel Hill Association. She produced 81.7 lbs. butterfat. The second high cow is a registered Holstein in the same herd, which produced 75.8 lbs. butterfat. The third and fourth high cows come from the herd of C. W. Newman of the Wyalusing Association, with records of 74.4 lbs. and 69 lbs. respectively. Cow testing associations have been in continuous operation in Bradford County since July 25, 1913, when the Bradford County Farm Bureau took this means for live stock improvement. A gradual improvement has taken place, especially in the nmber of pure-bred herds. The Laurel Hill Cow Testing Association, which completed its year's record in June, has established a new yearly record in the county for cow testing associations up-to-date. A grade Holstein, Elsie, owned by C. S. Chaffee, produced 14,890.5 lbs. milk testing 4.1 and yielding 588.11 lbs. butterfat for the year. The seventh association for Bradford County expects to start work this week and will be known as the Towanda Cow Testing Association.

Richfield, Wisconsin:—A basket picnic was held at the Schowalter Farms June 16th for the association. Mr. Schowalter sold at public auction his surplus pure-bred Holstein stock, numbering 15 head, as a total of $4,600.

Arkansas Valley, Colorado:—Feed prices here are: Alfalfa. $15 to $18 per ton; silage, $8; beet pulp, $4 per cwt.; cottonsed meal, $3.95; barley, $2.90; oats, $3.35; maize, $2.05; shorts, $2.60; bran, $2.40; corn chop, $2.65.

Douglas County, Colorado:—This association has been reorganized to include the Parker and Melvine sections. The tester reports 18 members using pure-bred sires, five using milking machines, and every member the owner of at least one silo. The creamery paid 70c per pound for fat during July. Milk retails for 10c to 12c per quart, butter for 70c per pound, and cheese for 45c per pound. Alfalfa is rated at $26 to $35 per ton; bran, $3.25 per cwt.; cottonseed meal, $5 to $5.50; linseed meal, $6; oats, $4 to $4.40; barley, $4.40; corn chop, $3.20 to $4.

Johnstown, Colorado:—June milk retailed for 14c per quart. The condensery paid 68½c per pound for fat. Feed prices are: Alfalfa, $15 to $20 per ton; silage, $8 to $11; dried pulp, $1.75 per cwt.; bran, $2.65; maize, $2.60; cottonseed meal, $4.25; linseed meal, $4.50; Emmerfeed, $3.10; oats, $76 per ton; barley, $67.

Plattville, Boulder, and St. Vrain Vallies, Colorado:—This association has a condensery and a retail milk dairy company market, and milk is sold rather than cream. Feed prices are: Alfalfa, $20 per ton; silage, $7; beet product, $2.25 per cwt.; cottonseed meal, $4.50; linseed meal, $5.20; oats, $4.20; corn chop, $2.80—$3.90; mixed feed, $4.

Otero County, Colorado:—This association is being reorganized for another year's work. The pasture is good and the average cost of milk per cwt. is 95c. The condensery paid $2.60 per cwt. for 3.5% milk in June. Alfalfa is rated at $18 to $22 per ton; bran, $2.70 per cwt.; cottonseed meal, $4; linseed meal, $6.50; oats, $3.65; chop, $3.50; shorts, $3.05.

Rusk County, Wisconsin:—This association was organized and started work March 1, 1920. There are now 36 herds on test. The average production of the association for June was 721 lbs. milk and 27.9 lbs. butterfat.

The Concrete Silo

HOARD'S DAIRYMAN:—I often wonder why it is that farmers get the impression that a concrete silo will crack or is due to crack sometime. Our concrete silo has stood now for nearly five years and there is not the slightest sign of its giving way or settling out of line. I never heard of but one concrete silo that cracked and that was due to faulty construction.

To illustrate the strength of such concrete work, last summer my brother and I built a twelve-foot circular watering tank for watering

live stock. It has a four-inch wall two feet in height which is reinforced both vertically and horizontally with rods we found about the farm. The tank heater I ordered before Christmas did not arrive until in February, after most of our cold weather was over. This tank froze solid to the bottom and the ice stood 12 to 18 inches deep in it. Many declared the tank would break, but it came through uninjured in any way.

Concrete silos are being built here with four-inch walls instead of six as was our first silo. From all appearances, the four-inch wall should be amply thick and strong enough. The chief thing to consider in building a concrete silo of the monolithic type is that of getting it constructed by competent workmen and to have it adequately reinforced.

One may be able to secure the forms and put up the silo himself, but I believe that if a competent contractor can be secured whose charges are reasonable, better results will be had. One contractor I knew of furnished the forms and supervised the work of construction while the farmer furnished what help he could secure to mix the concrete and raise it into the forms with a small gasoline engine. This is a satisfactory arrangement which permits the farmer to cut down the expense of labor charges if he has a son or two and a hired man. It is out of the question for a farmer to buy a new set of forms in order to build his own silo, because the price of the forms is equal to the cost of the silo itself. The forms may be rented, but still one would not care to take the chances of doing so and expect to get his forms back in good condition.

A contractor may be a little difficult to find unless you know how to go about finding one. I wrote to the manufacturers of cement and they very kindly gave me the names of a number of firms which manufactured forms for building concrete silos. I then wrote the form manufacturers who in turn gave the names of a number of contractors and form owners in our vicinity.

That is about the quickest and most convenient way of getting the names of contractors who will be glad to bid on the construction of a silo. In this way you reach men near you so that the forms may be moved easily and quickly.

The best time of year to build is usually just after the harvest in the latter part of July or August if home labor is to be used, because at that time the heaviest part of the summer work is out of the way. There will be time to complete the silo at least two weeks or more before extra early filling time, and give the cement a chance to harden thoroughly. I know of one concrete silo that was built in September and it was filled with corn within a few days after completion without any injury. With both sides of the wall exposed to the air it would seem that curing of the concrete would be very rapid. When good aggregates and a good grade of cement are combined with thorough mixing, the walls become as hard and firm as stone in a very short time. Such walls do not crack when properly reinforced. Concrete makes a permanent, fireproof silo which keeps silage perfectly.

Indiana. J. L. JUSTICE.

Showing method of placing vertical and horizontal reinforcing rods, arrangement of doors, and the plan of attaching concrete chute forms.

Man's Greatest Blessing

This is the gospel of labor—
Ring it, ye bells of the kirk!
The Lord of love came down from above
To live with the men who work.
This is the rose He planted
Here in the thorn-cursed soil;
Heaven is blest with perfect rest,
But the blessing of earth is toil.
—Henry Van Dyke.

Brian, C-816. An eight-room house of the Colonial expression designed for the Curtis Companies by Trowbridge & Ackerman, finished with Curtis Woodwork of architectural character.

Think of your BOOKS when you build

With one door and a pedestal base.

A BOOKCASE should be as much a part of your house as your books are a part of your life. This bookcase will be a beautiful part of your home today and equally as attractive to the next generation. Your children will grow up to love it, and link it with the treasures that it holds. There may be the books that father bought and hoped his children would later read, besides your own well-thumbed volumes of favorite nursery rhymes.

When you plan your house, you can provide a permanent place for your books with Curtis Woodwork. The time to put in a bookcase is when your house is built.

This is bookcase C-575. You can have it, just as you can have china closets, mantels, sideboards, buffets, kitchen dressers, dining alcoves, bedroom dressing tables and tray cases, stairs, doors, windows, and interior trim, built into your house as an integral part of the house itself, a part of the very structure.

This Colonial bookcase is designed to harmonize with all the other Colonial woodwork in a Colonial type of house.

Curtis Woodwork is designed by Trowbridge & Ackerman, architects, of New York, who designed and planned a large number of houses to be built with interior and exterior Curtis Woodwork. These houses range from three to eight rooms and are developed in four architectural expressions—Colonial, English, Western, and Southern. Appropriate woodwork is designed for each type of house.

A real service to the prospective house builder, especially to those with modest means, who have not always been able to gratify their good taste, goes with the use of Curtis Woodwork.

Curtis Woodwork is standardized in designs and sizes and is produced in quantities. The cost of production is thus brought down, and the cost to you is accordingly lower.

All designs of Curtis Woodwork may be seen in the Curtis Catalog, which your lumber dealer can show you. Your Curtis dealer can also obtain for you without charge portfolios of Better Built Homes, designed to include Curtis Woodwork when built. Or you can send us the coupon with 25 cents postage (50 cents in Canada), specifying which portfolio you want. "Better Built Homes," Volume VI, shows exteriors, interiors, and floor plans with complete descriptions of 32 houses of three, four, and five rooms; Volume VII, of 32 houses of six, seven, and eight rooms; Volume VIII, of 32 houses for farm use. If your plans for a home are still in the dream stage, and you feel it is too early to talk to a lumber dealer, then use the coupon for securing portfolios at 25 cents each (50 cents in Canada.)

Wickliffe, C-611
A charming six-room house of Southern design with Curtis Woodwork of appropriate architectural type designed especially for it.

Lathrop, C-813
This is an eight-room home of the English type which also has its own distinctive Curtis Woodwork inside and out.

The Ups and Downs of a Co-operative Milk Plant

HOARD'S DAIRYMAN:—In a fine dairy town not far away there was built some few years ago a creamery capable of handling a large quantity of milk by the farmers of that vicinity. The building was done before the Dairymen's League commenced to function and the action of the farmers was brought about by the continued pressure of the milk dealers of those years. The specific acts that caused the small rebellion of the farmers need not be recited, but any dairyman who has been in the business ten years can readily select some one or more of the customary incidents of those years and not go far astray.

In those days it was hard to get farmers together on any enterprise and it was hard for them to raise the money for payments for stock. It took a great lot of pressure to get a start made among the dairymen and it took an equal amount of exertion to keep the ball rolling until the creamery could be built. All this came to pass, however, but like many another similar plant, it came about that there remained a large indebtedness when the building had been completed. Right here is where so many concerns have gone shipwreck. This one came near it.

Were it not that some lesson may be learned from it, there might not be need of reciting the story. It was before the days of the present membership, co-operation law had been acted, but fortunately a lawyer drew the incorporation papers who knew something of the necessity of making the affair as nearly co-operative as possible. At any rate it would have been quite difficult for any outside corporation to buy up stock and gain control of the property. It is to that fact that the concern remains today in the farmers' hands. Very many others, not a few of them within a few miles from the location of this plant, have had a new lease of life as co-operatives and have then been taken over by some of the regular milk companies or been forced out of business by them not infrequently at a heavy loss to the stockholders.

It is safe to say that a co-operative creamery or station should never be organized under the old stock company laws. A majority of the lawyers of today will insist that there is no other safe method. They say that the old line co-operatives have been tested out, have had court decisions and other experiences until a lawyer knows what to depend upon. The new co-operation law, he urges, is untried and should not be invoked. There is argument in this but the new membership plan has had experience enough to make it fairly safe and it is best to employ a lawyer who is in sympathy with it, or at least, not against it. As stated, this plant is operated under a charter that has as many features of the new law as could be marshalled at the time of its formation.

The creamery and its equipment cost right around $23,000. As a general thing this is about as low a cost as a really good plant can be got ready, indeed in these days of high prices we may expect to pay more. There have been special plants for some particular purpose put in shape for a good deal less. I once knew a butter factory doing quite a business put in shape under the low price era for little above a thousand dollars. In these days when there are large quantities of milk to handle and all sorts of products to be turned out, we may expect plants to cost from $20,000 to $100,000 and occasionally more.

At one time this concern had a debt of $14,000. Two leans had been filed and it began to look like a close down. No trouble at all if the farmers would stay by, but you know about what happens when there is a big debt and uncertainty. The farmers tried to run the business. They could manufacture, but the regular dealers with city connections had the markets. The competitors paid the price, then came back in a few days with additional checks to their patrons, one month with seven cents additional and another thirteen cents. The farmers had to run the business and they must pay interest on the debt if no more. The stock holders' dividends had to be passed. Several trials were made at renting with indifferent success, and the dairymen commenced, or rather continued, desertion. Blue days those for many.

It would be impossible for me to go into all the details but there were few people who could explain just what to do next although enough could say what should have been done. At this juncture something happened. The unexpected is always happening. The big wealthy concern that oppressed the farmers earlier, then oppressed the creamery organization, suddenly announced that they would close their business. This made it necessary for the co-operation to get into action at full blast. They did as well as they could but the management felt greatly relieved when the representative of a high class concern came along and offered to rent the property. It took quite a little experimenting to get under full headway and complete a contract that could be considered satisfactory.

Finally after the plant had been run for a little time the renting company decided that they wanted to lease for a series of years. They proposed to go into condensed, evaporated, and dry milk manufacture and the cost would be considerable for additional equipment. There were a hundred thousand pounds of milk a day available if the entire patronage could be held. Milk companies have had experience in holding patronage and they have various plans for doing it, some of them none too commendable. In this case it would seem as though the plan may be regarded as a fair one.

The plant was rented for fifteen years at a flat rental of seventy-five dollars a month. All upkeep and expenses to be paid by the lessee except those caused by the elements. That was not enough to pay interest on the cost, to say nothing of paying the indebtedness and an occasional new roof, etc. As stated, the renters wanted all the milk. They said they would pay fifteen dollars a month for all additional units of 10,000 lbs. of milk. An average of 90,000 lbs. for a month meant $135 above the flat $75. This, by keeping all the patrons together would bring enough to pay up

FAYNE ARBUTUS DE KOL, HOLSTEIN COW OWNED BY EARL PETERS, MICHIGAN

In seven days she has produced 550 lbs. milk containing 19.28 lbs. fat.

debt. At the present moment there is less than two thousand dollars back, and the lease has yet a long life.

Then there are one or two other chances to smile. A big concern came in at about the time this arrangement has got under way and brought the plant that had been closed by the other big concern. The plant cost originally somewhere around fifty to seventy-five thousand dollars. Much was spent to remodel and improve the plant and then came the drive to get the milk. Bands, halls, speeches, and arguments were made use of. The farmers did not respond greatly. With a very few exceptions they stayed with their own plant and by the concern that rented it. A few small dairies not readily accessible sold to the new company by having their milk hauled for them. Further than that this management had to go out of town and ship in milk by train and truck to keep them going. Both are running, and that is an advantage to the town and helps the farmers to get better tests and terms.

It is well to add that in case of any trouble between dealers and the League the company leasing the creamery is to manufacture for the farmers during any such period. Further all milk is bought through the League in the regular way. No milk is sold to the local people, they only elect where it shall be sold so long as there are buyers at the two plants.

New York. H. H. LYON.

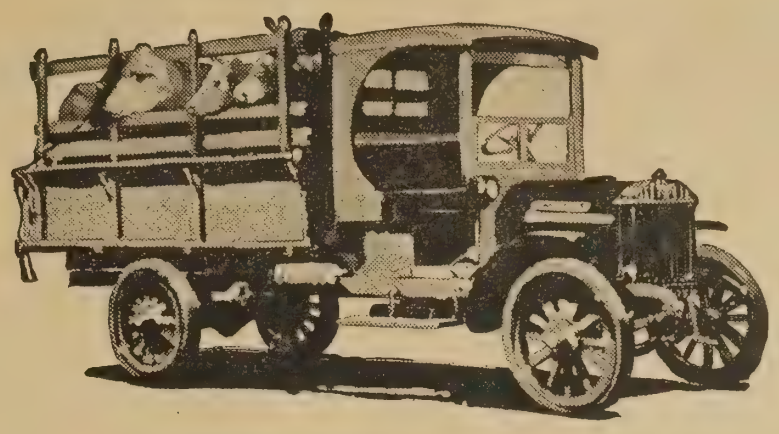
Dairying Thirty Years Ago

Notes from the Issue of Hoard's Dairyman for Thirty Years Ago This Week

"About 7¼ to 8 cents for July cheese, and 20 cents for last week in July butter, is not much calculated to make a dairy farmer think he has missed his calling—if he has good cows. The old cow stands to the front yet, and is the 'color-bearer' for the army of progress."

"With improved dairy herds, and improved methods of manufacture and sale, butter can be made and sold cheaply and yet with a fair margin of profit. The ingenuity of man tends towards the cheapening of all industrial products, and the farmer cannot escape this law. He must move with the 'procession', and he ought to realize that what is done in manufactures and trade can also be done to a great extent in agriculture."

"As we rode home from Baraboo, early last Monday morning, after the terrific storm and copious rains of Sunday afternoon and Sunday night and saw the deplorable condition of thousands of acres of wheat and oats in the shock, we inwardly pitied the owners who insist upon so operating their farms that the work of the year is subject to the perils of a week's weather at the last end; and we congratulated the stock and silo farmer who is far more independent in that he has reduced the perils of harvesting to a minimum, and has also far less risk in growing the crop; for he has the fertilizers from his stock to command growth through the dry time, when the products of the exclusive grain farm wither on the stalk."



Canadian reader, having trouble in harvesting "10 to 14 ft. corn" for silage and seeking advice, received the following reply: "As yet we know of no more reliable way to harvest such tall corn than to slash it from the hill with a heavy corn knife, and lay it in gavels preparatory to carrying them upon the truck wagon to be hauled to the silo. Late last fall we heard something of the plan of cutting it with a V-shaped boat armed on two sides with a knife. Driving between two rows cut both of them, as a horse drew the knifed boat along. To hold it firmly down, two men stand upon it, and gather the corn in their arms as it is cut. When each gets all he can hold and carry, the horse is stopped, and the bundle is laid down. Whether this has been used enough to call it a reliable way, we hardly know, yet. It it about time for those who know, or those who manufacture such cutters to 'let their light shine', for the benefit of their fellows."

This correspondent said of the use of silos in his neighborhood: "Many farmers here are contemplating the erection of silos, but await the action of the more progressive ones, hoping to benefit by their experience, and in order to avoid some mistakes already made by those who have bought machines that have caused delay and lots of "vexation of spirit". His statement elicited this comment: "Those farmers of 'little faith' could get into the 'kingdom' quicker, through informing themselves,—as the literature of the silo is now plenty and to be had for the asking, of all manufacturers of good ensilage machinery —than to wait to see how their more enterprising neighbors come out."

R. P. McGlincy is quoted as follows: "Dairy farming is being reduced to a science, and the thinking, progressive men in the business are keeping up with the procession, and those plodding members of the fraternity who do not keep up will say that dairying does not pay. And it doesn't pay them, for they do not know how to make it pay."

The following testimony by an Iowa farmer emphasizes the tremendous changes which have been inaugurated in agriculture: "Most of our grievances are imaginary. Were any of you alive in 1842? I lived in eastern Iowa, a territory at that time, and hauled shelled corn from Morning Sun to Burlington—28 miles—and sold it at 6¾ cents a bushel. The very corn was shelled in a washtub. We dressed our own pork and hauled it to the same town for 1½ cents per pound; and made our own clothing, lived on pork, corn bread, and rye coffee, went without shoes, and were very happy."

Plenty of clean drinking water and lots of shade will keep many a valuable hog from getting sick.

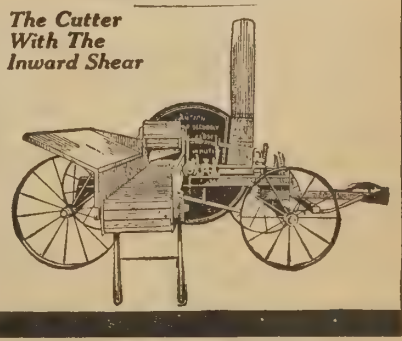
Diamond T Farm Special

A *good* motor truck would add to your profits even if it did not work for dollars-and-cents less than horses. The 30 to 45 minutes it saves from every hour on the road could well be spent more profitably than on the seat of a wagon. Your products, sooner marketed, would be in better condition; therefore worth more money. Progressive farmers have found that motor haulage actually earns money in many other ways—such, for instance, as minimizing losses due to "shrinkage."

*Diamond T Farm Special delivers **lowest final cost** farm transportation—because it is built to meet actual farm conditions. Let us tell you **how** and **why**. The reasons are in a 32-page book—100 interesting illustrations and non-technical explanations—that will come by return mail upon receipt of your name and address.*

DIAMOND T MOTOR CAR CO.

Builders of "The Nation's Freight Car"



4545 West 26th Street Chicago, Illinois

CLIMAX ENSILAGE CUTTER

CUTS and elevates with less power than any other cutter made.
SAVES time--Saves men--Saves money. Automatic feeding device makes easy feeding.

The Cutter With The Inward Shear

free Catalog In colors explains how you can save money on Farm Truck or Road Wagons, also steel or wood wheels to fit any running gear. Send for it today.

Electric Wheel Co.
31 Elm St., Quincy, Ill.

EDITORIAL COMMENT

It is well to advise the consumer regarding the food value of milk and its products but it is also wise that a higher quality of dairy products be produced. Complaint comes from every source of the poor quality of butter, of its high moisture, of improperly made and cured cheese, and of the low standards of ice cream. There is not one of these products that could not be materially increased without any effort, so far as advertising is concerned, by simply producing a more uniform and higher quality of all dairy products.

Since milk has been pasteurized and bottled there has been a decided increase in consumption, for along with the pasteurization and bottling came the campaign for the production of a higher grade of milk. The man on the farm who produces the milk may feel that he has little to do with increasing the consumption of his product, but if he were fully advised regarding how much more dairy products the consumer will eat when they meet his personal taste, when they are of good quality, he would view his position with more concern. A butter that will score from 92 to 95 will be consumed in much larger quantities than butter scoring from 85 to 90. The same applies to cheese, milk, and ice cream.

It is encouraging to note that many breeders are anxious to place their herds upon the Accredited List. In order to have herds upon this list, the animals must be free from tuberculosis and placed under the supervision of both the federal and state governments. The establishing of tuberculosis-free herds in this manner is dealing with tuberculosis systematically.

Little progress was ever made in the eradication of this scourge until requirements provided that those desiring compensation for animals slaughtered on account of tuberculosis must place their herds under the supervision of the federal and state governments. It is a tremendous undertaking to eradicate tuberculosis from all the cattle in this country but it can be done if every owner is willing to follow out the plans provided.

According to the report of the Bureau of Animal Industry, the owners of 500,000 cattle have placed their herds under federal and state supervision since 1917. On April 10, 1920, 25,793 herds scattered throughout the United States were under the co-operative supervision of the Bureau of Animal Industry and state veterinarians. So far, 2,230 accredited herds containing 60,237 cattle have been established. These herds were all free from tuberculosis and are tuberculin tested every year.

At the present time over 115,000 cattle are on the waiting list to be tested. The work has developed more rapidly than was anticipated by those who are responsible for bringing about accredited herds. It shows that most farmers are willing and desire to have their herds free from tuberculosis as they appreciate it is to their interest to eradicate tuberculosis from their herds.

NOW AND THEN

There is much complaint at the present time regarding our conditions and existing evils. We feel they are to a large extent imaginary and that we over-emphasize our present situation. We appreciate certain business practices could be improved, and that there are evils that ought to be eliminated. But, take it on the whole, we believe the laborer the farmer, and the business man are making greater progress, enjoying larger incomes, saving more than at any other period in our history. This should not lead us to be content, for no great progress is made unless there is a certain amount of discontent to move us forward and upward. But we should not let our present conditions disturb us so much as to make us unhappy or feel that we are going to everlasting smashup. Let us not make mountains out of molehills.

In this week's issue we publish a few statements taken from an issue of Hoard's Dairymain published thirty years ago. There is an item in these notes well worth considering. One man wrote us at that time that he had lived in eastern Iowa in 1842, a territory at that time, and hauled shelled corn from Morning Sun to Burlington—28 miles—and sold it at 6¾ cents per bushel. "The very corn was shelled in a washtub. We dressed our own pork and hauled it to the same town for 1½ cents per pound; and made our own clothing, lived on pork, corn bread, and rye coffee, went without shoes, and were very happy."

It is sometimes well for us to consider what the early pioneer went through, to note how he lived, the prices he received for his products, and to compare that time with the present. Such reflections may lead us to realize that after all we are living at a time when we not only have opportunity for making more money, but opportunity for the greatest enjoyment.

WASTE OF WOMAN POWER

The necessity of modernizing the farm home cannot be overestimated. It is the tendency and almost the universal practice for the farmer to purchase all modern machinery for operating his farm and equipping his barn with every device for saving labor before any attention is given to the purchase of home conveniences for his wife and family. There is a reason for this because improved machinery and better equipment for the barn makes it possible for the farmer to secure a larger return but we believe it is carried too far.

We have had opportunity of late to observe farms well equipped in every respect for field and farm work but the houses had no modern conveniences and yet the farmers were adequately able to purchase them.

The farmer often complains about his long hours in close confinement but we believe on the average the woman's work on the farm is more confining and the hours longer than that of the farmer. We should not look upon the farm as merely a place to make money but rather a place to build a home and a life. This cannot be accomplished until the woman's work is considered of as much importance, if not more, than the man's and when this point of view is taken it will be observed that the conveniences of the household are quite as important as modern machinery and improved methods of doing the work in the barns and fields.

We commend to our readers an article entitled "Waste of Woman Power a Menace to Rural Life", which we publish elsewhere in this issue.

STRIPPING AND TOPPING CORN

Many years ago it was a common practice to top and strip corn. This meant that the stalk above the ear was cut and the leaves below the ear were stripped. The fodder secured in this way made very good feed, but it was expensive from the standpoint of labor, and since the advent of the silo we have heard little about topping and stripping corn.

We have better ways now of securing feed. According to the Progressive Farmer there are still those who advocate the system of pulling fodder which means removing the leaves of the corn and in its condemnation of this antiquated practice it points out that experiments conducted by Croker of South Carolina, Lloyd of Mississippi, and Duggar in Alabama showed a loss of three to nine bushels per acre when the leaves were pulled.

Duggar says the leaves obtained will equal about one-fourth the weight of the grain yield. In other words, the loss in the yield of grain by removing the leaves would be greater than the nutrients secured in the leaves. There is a loss of not only labor, but of food, and it is strange that some agricultural people, as the Progressive Farmer has so well pointed out, should be advocating this method of securing fodder. If more forage is needed and there is no silo, then cut the corn, husk it, and feed the stover to the live stock. The best way, however, of preserving the corn crop is through the silo. A larger percentage of it is saved for animal consumption and there is less loss in handling and preserving it. At the present time we can't imagine any condition where a person would be warranted in topping and stripping corn or pulling the leaves as it is termed in the South.

POLITICS AND MILK

The differences which have existed between the milk producers' organizations and the distributors may to a large extent be attributed to political office seekers. It was remarked to us recently that if the political agitators would withdraw from the forces which are trying to regulate the price of milk, there would be little or no friction between the milk producers' associations and the distributors. To be a success in politics requires publicity and since milk is such an important food, the interest of every consumer is affected whenever there is an advancement in price.

The political agitator is shrewd enough to see that he can gain for himself headlines in the daily paper by saying something against the advancing price or make it appear that either or both the producer and the distributor of milk are guilty of illegal conduct and that he is trying to force them to act legally. These men, who seek office by such tactics, are a menace to the public and it is to be regretted that the actual facts concerning the cost of producing and distributing milk cannot be set forth before the consumer in order that he may understand why it has been necessary to advance the price.

The chief politician is not concerned about sober facts and neither are many of the daily papers. The desire is for headlines. We hope the time may come when truth, justice, and useful information will sell as many papers and gather as many votes as meaningless headlines and worthless talk. It would be a relief to the dairy industry if these would-be savers of the consumer would find some other field for publicity and give the milk producers and distributors a rest for a period of time.

WHY PURE-BREDS

Why do men engage in the breeding of pure-bred animals? In the census report taken of the Holstein-Friesian Association of America we find various reasons given for engaging in the breeding of pure-breds. The following are some of them:

"I engaged in the breeding of pure-breds because I could feed and care for them just as economically as grades and their offspring is worth more money."

"More profitable than grades. A good demand for all surplus stock. Also it is interesting to breed and develop pure-bred Holsteins."

"Wanted better cattle."

"I like their looks best and their money making."

"Want to breed the cattle that most buyers want to buy."

"To get the money and for the love of the cattle."

"First, because I consider they are the only cattle for milk production. Second, most of my neighbors are raising Holstein stock and I consider it good policy to work with my community on all lines."

It will be observed that these men selected pure-bred cattle because they consider them more profitable than scrubs or grades. It is pleasing to us, however, to observe that the breeding of pure-breds creates a greater interest in their work. In the conduct of any business, the monetary return must not be lost sight of. It is only the dreamer—the pure idealist—who ignores money returns. Those engaged in business appreciate that it is the dollar that measures their success, although it may not be the best measure of human endeavor or of service rendered.

There are no objections to a man making money providing he renders a service. He is entitled to earn and the man who does not have this desire is not, as a rule, a good citizen. In connection with the desire to make money, it is most wholesome to develop an interest in the work of developing

animals or machines which are most efficient. Invariably when there is an interest in work, drudgery is removed. It is highly desirable to make work both profitable and pleasant. If a person is not happy and contented in his work, there is little opportunity for happiness in life.

Cost to Feed Calf

Please tell me the approximate cost to feed a calf and feed and house a horse for one month.
Willmette, Ill. C. F. B.

Our inquirer must appreciate that the cost of feeding a calf varies greatly under different conditions. Not only may it cost him considerably more or less than it will some other dairy farmer but there is a great variation on his own farm. In a general way we believe it will cost about $60 a year to feed a calf from birth to the time it is a year old, making the average cost throughout the first year about $5 per month.

Variation in the cost of keeping a horse is quite as great but we give the estimate of the monthly cost as being about $15 to $18.

Breed Secretaries

Can you give me the addresses of the various national breeders' associations?
Osceola, Wis. I. W.

The following are the addresses of the secretaries of the five dairy breeds:

F. L. Houghton, Holstein-Friesian Ass'n. of America, Brattleboro, Vermont.

W. H. Caldwell, American Guernsey Cattle Club, Peterboro, New Hampshire.

R. M. Gow, American Jersey Cattle Club, 324 West 23rd St., New York City.

J. G. Watson, Ayrshire Breeders' Ass'n., Brandon, Vermont.

Ira Inman, Brown Swiss Breeders' Ass'n., Beloit, Wisconsin.

Sudan Hay vs. Legumes

Please inform me regarding the relative feeding value for Holstein cows of alfalfa, clover, and sudan grass hay. We can grow sudan grass quite successfully here and clover and alfalfa are very uncertain. If sudan grass hay compares favorably with clover or alfalfa as a dairy cow roughage it would be much more profitable for us to grow it.
Chillicothe, Mo. J. M. B.

Sudan grass resembles timothy and Johnson grass much more closely in its chemical analysis than it does alfalfa or clover. It is fully as high in carbohydrate value as the two legume hays but much lower in its content of protein. It is about equal in feeding value to millet. Under most dairy farm conditions it will be very much less valuable in the dairy ration. If it is possible to feed rather liberally of high protein concentrates, its low amount of protein can be balanced in the ration in that way. If alfalfa or clover can be purchased at reasonable prices their use will be more economical than buying large quantities of high protein concentrates to make up a protein deficiency in the roughage.

Choosing a Breed on Records

Please give me the milk and butterfat records of the four breeds. I have a neighbor who gets some funny ideas. A year ago he was in favor of the Holsteins but now, according to him, they are the very poorest breed in the world and not only that but he claims to have a comparison of the four principal breeds in which the Holstein stands last in both milk and butter.

Please give me a good grain ration for a 5-month-old pure-bred calf, male. He has all the skimmilk he will take.
Bloomingdale, N. Y. S. F. W.

The highest records made by the four dairy breeds are listed in the following table:

Breed		Lbs. milk produced	Lbs. fat produced
Holstein	Duchess Skylark Ormsby	27,761.0	1,205.00
Guernsey	Murne Cowan	24,008.0	1,098.18
Jersey	Plain Mary	15,255.9	1,040.07
Ayrshire	Garclaugh May Mischief	25,328.7	894.91

In making a comparison of breeds beware of the use of record animals. Because one particular cow may make a great production is very little indication that the breed to which she belongs may excel other breeds. From an intensive study of dairy cattle we have arrived at the conclusion that there is rather small difference in the productive capacity of the several breeds—rather, we hold that the variation to be given greatest attention lies within the breed. A beginner does well to see to it that in the selection of his cows he secures good individuals of any one breed. He need then have no fear of unfavorable comparisons with the production of other breeds.

Our correspondent's neighbor is wrong if he considers the Holstein to be an inferior producer of milk and butterfat, yet we warn again against choosing this breed simply on the production of Duchess Skylark Ormsby.

This five-month-old calf has reached an age when he should make good use of such roughage as good quality clover or alfalfa hay. Skimmilk fills a place of its own and is of very great value in calf feeding. Our inquirer should see to it that he does not overfeed the calf with skimmilk, however; 18 to 20 lbs. being a maximum amount of feed for a day. In addition to this hay and milk a mixture of equal parts of corn and oats should give good results. The addition of a little oil meal may have a tendency to give the calf a sleek appearance. With a calf of this age, we would not grind the grain mixture.

How Much Feed to Buy

One of the dairymen in this county has requested me to get your opinion on the balancing of a ration for dairy cows weighing about 1,400 lbs., and giving about 25 to 30 lbs. of milk daily.

The home-grown feeds are: Alfalfa hay, oats, corn and cob meal. In addition to these, he intends to buy oil meal, and he wishes to know if, at the present prices, it would pay him to purchase bran also. He has nine cows and would like to know how much bran and oil meal he would have to purchase for these cows, provided the feeding periods would be four or six months.
Green Lake, Wis. J. L.

It is very difficult to tell a dairyman exactly how much feed he should purchase. He can come near calculating it, however, if he can estimate at all closely the quantity of milk his nine cows will produce throughout the period for which he will purchase feed.

Alfalfa hay makes a splendid basis for his ration. It should be supplied in as large amounts as his cows will consume. He will cut down the amount of concentrates necessary to maximum production if he will be liberal in his supply of this protein roughage. A good concentrate mixture to supplement the hay may well be made from 400 lbs. corn and cob meal, 200 lbs. ground oats, and 100 lbs. oil meal, this to be fed to Holstein cows at the rate of one pound for every 3½ to 4 lbs. of milk produced. It should be supplied to high testing cows at the rate of one pound for every 3 to 3½ lbs. of milk produced. It may prove that a combination of alfalfa and oil meal will be so laxative that it will pay to supplement or replace oil meal with cottonseed meal for some of the cows in this herd. If the supply of oats is adequate there is no advantage, at present prices, in substituting it with bran.

Fairness of Lease

I am renting a farm on halves. I am to furnish my team (3 horses), one-half of all live stock—cattle, sheep, pigs, poultry, etc., and receive one-half of increase and one-half of receipts from all sources. I am also to furnish one-half of all tools, seed, fertilizer, feed, etc., and do all the work. I do not feel that this is fair. Would you give your opinion as to whether you consider this fair or not.
Michigan. SUBSCRIBER.

The terms of the lease above described are more liberal to the tenant than usual, in that the owner is furnishing a half of the work equipment. In most dairy farm leases the owner furnishes the land, the buildings, the permanent equipment, one-half the productive live stock, one-half the purchased feeds, seed, and fertilizer, makes all permanent improvements and large repairs, supplies, fencing material for repairs or extensions that tenant erects, pays half the threshing and silo filling expense, etc. The tenant supplies all the work stock, horses, equipment, and tools; hires all labor to do the usual farm work, keeps weeds cut along fence rows and lanes, and in general does all the work needed in proper operation of the farm. The horses are fed from the undivided feed as also all the live stock on the farm. The income from the farm is divided half and half, or the products or live stock to be sold are divided on this basis. The increase in stock is also divided on the half-share basis.

All lease contracts vary from this form in certain details. Occasionally the farm owner offers a very liberal lease in order to attract a particularly efficient renter or for some other personal reason. We have known of cases where the owner has supplied all the productive live stock and a part of the farm machinery, at the same time securing one-half the farm income and the increase.

Different types of farm leases were quite fully described in our issue for February 6, 1920. This issue also contains a general discussion of the basis of a lease that is fair to the owner, the tenant, and the land.

Demand for Beet Pulp

The excellent inquiry for dried beet pulp has rapidly exhausted the domestic supply this year. Bids from stockmen and jobbers for larger quantities than were formerly contracted for were received by the larger manufacturers who had difficulty in taking care of their regular trade.

While the average price received for domestic beet pulp was $51 per ton f. o. b., the factory, brokers, and jobbers during the period of feed scarcity were offering as high as $60 per ton. Jobbers were quoting to the trade at that time at $66 per ton. The small feeder was, however, unable to purchase his requirements at the latter figure because it represented carload price, sight draft basis. Less than carload lots were sold in certain sections at prices as high as $75 to $80 per ton. For instance, the price at Jacksonville, Fla., this week for ton lots is $77.

The domestic supply of beet pulp depends largely on contracts placed by the factories with the farmers to grow sugar beets. A certain acreage is contracted for and the production of beet pulp will be either large or small, depending on the tonnage of sugar beets produced on such acreages. Droughts, excessive rains, and insect pests materially affect the production and the resulting supplies of beet pulp.

Formerly most of the beet pulp was sold in a wet state, but, largely due to the high prices paid for concentrates, factories were equipped with facilities to preserve the pulp and ship it dry to various sections.

Beet pulp was received by stockmen with such favor that the supply has not been equal to the demand and it is no unusual occurrence at present for this feed to be quoted at prices relatively higher than those asked for feeds which it was intended to substitute. In the Southeast, for instance, 36 per cent protein cottonseed meal is quoted freely at $68 per ton in ton lots, while $10 per ton more is asked for beet pulp.

It is interesting to note that dairying interests in Europe have been for years large purchasers of the cottonseed cake and meal, both because of its excellence as a feeding stuff and its fertilizing constituents, while thousands of tons of beet pulp are being at present imported from Europe. The demand in the South, particularly in the Southeast, for the beet pulp is growing and has, during the past season, been greater than ever despite the fact that stocks of cottonseed meal are comparatively large.

Contrary to the general belief, there is at present no scarcity of beet pulp in the Northeast. Thousands of tons which are reported as being held in Philadelphia, New York, and Baltimore have not been moved on account of inadequate transportation conditions, lack of care, and labor difficulties.

Reports reaching the Bureau of Markets indicate that additional supplies from Europe have been contracted for and are in transit. About $55 per ton c. i. f. New York is asked for July and August delivery while $54 per ton is quoted f. o. b. New York now on docks. C. I. F. offerings should not be confused with f. o. b. offerings, as there is at the present time a vast difference between the two. The f. o. b. offering makes it incumbent upon the shipper to see that the shipment is loaded on cars within contract time, while the c. i. f. offer places the responsibility on the buyer.

The usual differentials between rate basing points do not apply on the imported beet pulp, and therefore rates from point of shipment to destination should be ascertained before it can be determined where requirements can be purchased to best advantage.

It is impossible to estimate how much beet pulp will be imported between now and October 15, the date upon which domestic supplies will probably be available. The volume of business will depend to a large extent on European holdings and the demand for this commodity in this country for the next few months. The foreign exchange situation is naturally an important factor. A few importations are due at southern ports in July.—U. S. Bureau of Markets.

(SPECIAL TO HOARD'S DAIRYMAN)

WASHINGTON, JULY 26—Milk rates, omitted from consideration because of the way they are fixed in the application of the carriers for the general rate increase which is now pending, have come sharply into the center of attention in the proposals made here the day after the award of the Railroad Labor Board was made public in Chicago. The wage award roughly estimated to amount to a six hundred million dollar increase in wages must be added to the increase in earnings of the roads. This was anticipated in every quarter which is considering the matter of freight rates, and was especially brought out in the presentation made before the I. C. C. by Clifford Thorne appearing for the Farm Bureau Federation and others some weeks ago, when he said that if the whole wage claim was granted and the railroads sought to raise it all by freight increases it would take a 55 per cent increase.

To get back to the milk rates. Instead of seeking to raise the whole six hundred millions by more freight increases, the railroad executives in a formal application to be filed with the I. C. C. propose to increase passenger fares twenty per cent, and milk rates from twenty to forty per cent. The balance is to be made up in straight freight rates.

This announcement called attention to one thing which had not been generally understood, that milk rates had not been included in the rates proposed to be increased under the previous application. It is explained that milk rates are a hybrid rate, based on specially fast and unusual service, and are more nearly akin to passenger rates than to commodity rates in general, hence, along with passenger rates were not included in the first increase. Perhaps this is the reason, or perhaps the policy involved that of leaving out one item which enters so closely into the cost of living as milk, was the controlling reason. The increase asked for is estimated to produce nearly if not quite a sixth of the whole of the proposed increase of six hundred million dollars, indicating the tremendous volume and value of the milk traffic.

No objections have yet been filed to this increase, but there is ample reason for filing such objection. It lies in the fact that freight rates on milk are borne, in the first instance at least, if not in the last analysis, by the producer of milk, not by the consumer. That is milk prices are base prices, in the main, paid by dealers at the city milk unloading station. The Dairymen's League, powerful as it is, and the Maryland-Virginia Milk Producers' Association which supplies Washington, bases return to producer on base rate less freight costs. Producers in the fifty-mile zone get the amount of the freight more than their associates living in the hundred mile zone, etc. And therefore this milk increase is just passing another double dose of the burden back to the producer, instead of ahead to the consumer. Increasing passenger rates and increasing rates on manufactured commodities does not entail this particular feature of the freight rate problem.

FAT HOLSTEIN HEIFERS AND STEERS IN THE CHICAGO STOCK YARDS, SOLD TO BELGIUM RECENTLY FOR BEEF PURPOSES

A report of the American Institute of Packers shows that during the first six months of this year there was a decrease of four hundred million pounds of dressed meat produced in the United States as compared with the same months in 1919. The reports are not available to show the decrease in number of calves kept for dairy purposes but all indications point to a decrease.

Dr. W. C. Fowler, health officer of the District of Columbia and uncompromising foe of the dairymen, is responsible for the statement which has appeared in most of the local newspapers that the Maryland-Virginia milk producers have been throwing their milk on the ground rather than permit a decrease in prices here. After a talk with him reporters on the local newspapers call the milk producers profiteers. In response to a letter from The National Grange, Dr. Fowler boasts that he has the information as to the names and addresses of the men who threw the milk on the ground, but refuses to disclose the names. Dr. Fowler says he is not in possession of the facts as to the cost of production of milk here which are necessary to justify the charge of "profiteering". Members of the association deny that there has been any waste of milk, saying that there has been a cream shortage at all times this season, and a milk surplus only a few days, also that at the time of this shortage and at all times there is a demand for the milk for farm feeding which makes it ridiculous to think that any farmer has thrown it on the ground. A dealer might have done this, after the milk had spoiled on his hands, they suggest, but no farmer but can use far more than he can possibly get.

During the past year more than four million gallons of ice cream have been made and sold in the District of Columbia, according to Health Department figures. Local ice cream manufacturers declare that the National Capitol consumes more ice cream than any other city of its size in the United States. The average wholesale price is $1.50 per gallon. It is estimated that the cost to consumers is about eight million dollars. The daily output of the principal factories at this time is 45,000 quarts, not including the hotel and restaurant, and many private stores which make their own supply.

Dr. Frank M. Surface, formerly a statistician connected with the Food Administration, and now connected with Herbert Hoover's Washington newspaper organ, is the author of a vigorous denunciation of the present oleomargarine tax law, in the current issue of this newspaper. He quotes statistics to show the tremendous growth of the oleomargarine business especially in the past four years and then protests against the hardship which the oleo manufacturers undergo because a ten-cent tax is "prohibitive" in the manufacture of colored imitation butter. In the face of the profits and the volume of the industry which he boasts, this argument for the wiping out of the public's most effective method of protecting itself against the substitution of an inferior product for real butter will be judged by the reading public on its own merits.

The National Dairy Show as a Service

The National Dairy Association is one of the many business organizations that have been formed in the past decade by all big business interests, which are all the result of the highly developed condition of our country—such as quick communication with every part of the United States, and the open publicity practiced by all business; so that the man who does not meet with others in his line of business, and help to further business enlightment, is recreant to his duty.

When the bankers, doctors, lawyers, and merchants and manufacturers of every line are holding annual conventions to develop and improve their professions and business nationally, the man in any branch of this greatest of all industries—the dairy industry—who is not willing to join hands with his fellows in the building of a great annual gathering for purposes of comparison and development, is surely living in the dark ages and is not desirous of establishing this industry which God has bequeathed for man's benefit, upon the highest code of ethics and honor.

Let it not be said any longer that any man in the dairy industry is not desirous of supporting an association formed for the benefit of his business, but let it become a mark of honor that each year every dairyman will strive for, to be counted among those present at the National Dairy Show this year in Chicago—October 7th to 16th, inclusive.—National Dairy Show.

Farmers' Marketing Conference

"The farmers of the Middle West have had co-operative grain elevators for thirty years without even making a dent on the market, and the trouble is you are speculators and not marketers," declared Aaron Sapiro of San Francisco, addressing a conference of farmers' organizations and farmers' co-operative marketing associations in session at Chicago to consider means for the stabilizing of markets for grain and live stock. Mr. Sapiro is attorney for fourteen of the largest California producers' co-operative marketing associations, which he declares are organized on the American plan of co-operation as applied to marketing.

"You are organized on a Roachdale plan which is an English consumers' co-operative buying plan and not a producers' marketing plan," continued the speaker. Mr. Sapiro then related the experience of the California raisin growers who, after repeated failures to realize cost of production, in 1911 united in a co-operative selling agency having control of over 77% of the California raisin crop. The result was undreamed of prosperity. Fresno, California, he says, was converted thereby from a city of poverty to the most prosperous city of its size in the United States. The Raisin Growers' Association has no capital and operates without profit. It exercises absolute control over the products of its members. The same idea has been successfully applied to practically all other California products both perishable and non-perishable.

As a solution of the grain marketing problem in the mid-west, Mr. Sapiro advocated organizing in each state a grain growers' association and the federation of these associations in a national organization, which would act as a selling agency for all grain grown by members of the state associations. This association would sell direct to millers and distributors; the entire proceeds, less actual cost of handling, being returned to the producers. He advocated the formation of a separate corporation with capital to take over and co-ordinate and standardize the local elevators, these elevators to do the warehousing of the crop, receiving in return fair interest upon the capital invested.

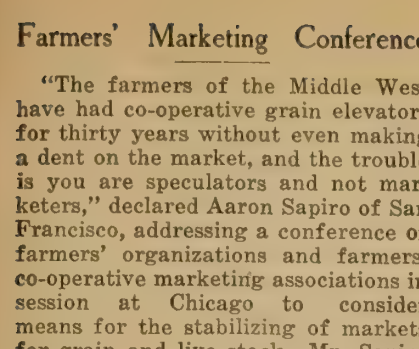
"The farmer is essentially a producer and not a marketer," declared Mr. Sapiro. "Marketing is expert work and should be done by experts. The trouble with the farmer is that he has not been willing to pay a fair price for expert service. You have no right to expect a fair price for wheat if you are not willing to pay a fair price for brains."

Mr. Sapiro does not advocate undertaking the marketing of live stock in a similar way until after all the packing plants are made public utilities.

The conference is the most important gathering of farmers ever held for the purpose of considering marketing problems. Practically all the state farm bureaus, state granges, state farmers' unions, equity societies, state associations of co-operative grain and live stock shippers in the mid-west are represented.

The morning session was addressed by Ben Drake, of St. Paul, Minnesota, president of the Equity Co-operative Exchange; Frank Myers, Ft. Dodge, Iowa, secretary of the Farmers' National Grain Dealers' Associations, and C. H. Gustason of Omaha, Nebraska, president of the Nebraska Farmers' Union. They all expressed a very earnest desire for some sort of effective co-ordination of farmers' co-operative marketing effort, which would extend the farmers' influence over terminal markets.

At the opening of the afternoon session Secretary of Agriculture E. T. Meredith addressed the conference. He stated that the Department of Agriculture is in touch with all the co-operative marketing enterprises in the United States and is anxious and willing to give information of value in the formation of such associations whenever called upon. He also spoke of the limitations placed upon the work of the department, particularly in securing crop reports, because of inadequate appropriations.



At the business session of the second day Mr. J. R. Howard, president of the American Farm Bureau Federation, was instructed to appoint a committee of seventeen to work out plans for the formation of one or more central organizations through which farmers' co-operative associations can market their grain. The committee of seventeen will be composed of representatives of the leading farm organizations and co-operative grain and marketing agencies in the United States. A convention of these organizations is to be later called to consider the recommendations of the committee.

The committee appointed to make suggestions on live stock marketing problems recommended that a separate conference be held in Chicago in the near future to especially consider this subject. This conferene will probably be held in about 60 days.

The Live Stock Committee was composed of James Plumb, president of the Kansas State Live Stock Association, John G. Brown, president Indiana Federations of Farmers' Associations, James Clemons, National Secretary of the American Society of Equity, Professor H. R. Munford, manager Live Stock Marketing Department of the Illinois Agricultural Association, E. P. Hubbard, president Nebraska Grain and Live Stock Association.

J. W. COVERDALE, Secretary,
American Farm Bureau Federation.

If the sheep have ticks, dip them; you can't afford to feed ticks, summer or winter.

"Customers, gladly pay more for butter they know is as perfect as when it first comes from the churn.

"That's why I wrap my butter in

Paterson Pioneer Parchment Paper

"Keeps it clean—sweet—pure. Makes my butter *worth* more and *sell* for more. Yet, the small cost of this Parchment Paper isn't worth considering when compared with my extra profit."

A Cow On Pasture Is Like A Man On Crackers and Water

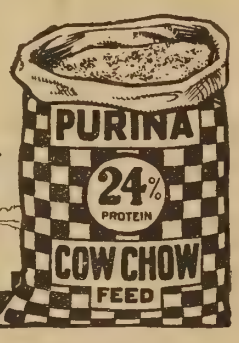
"I can't keep up milk production through the summer on grass alone. I need more protein as the grass dries out. Give me a gallon of Purina Cow Chow per day and I'll give you a gallon and a half of extra milk."

Grass now is drying out and is largely fiber, with very little protein. Anything like full production of milk is impossible, without adding a balanced concentrate, rich in protein.

What happens to the Cow

A cow on pasture alone runs down physically. The better producer she is, the more she draws upon her own flesh and bones for protein and minerals for milk. This weakens her, occasionally making her swaybacked. It leaves her in bad shape for cold weather.

Purina Cow Chow Stops Serious Losses



It supplies an abundance of protein (24%) in the most digestible form and is rich in minerals. It is just what you need to balance late summer pasture. Money invested in Purina Cow Chow during August should produce 100% profits in extra milk. You can prove it with your cows.

Do You Milk 6 Cows or More?

IF you do, you have undoubtedly asked yourself these questions:--Is it *true* that a milking machine will greatly reduce my milking time? Is it absolutely safe to use on my cows? Will it pay me to install a milker in *my* dairy?

These questions, and hundreds of others, are answered in a fair-minded way in this new booklet:

"The Truth About Mechanical Milking"

This booklet of bed-rock facts is *yours for the asking.* It has been prepared by the Universal Milking Machine Co., but it is *not* a Universal catalog. Only a few pages in the back deal with the Universal directly. It is written to give you *the real truth*--facts you have always wanted to know--about mechanical milking. *A book of vital interest to every dairyman who milks six cows or more.*

Clip this coupon and send it to us today. No obligation. The book will be mailed, free of charge, and postpaid, immediately upon receipt of your letter.

A County League Meeting

(Continued from page 67)

en. Finally the compromise was made by which the league accepted a price for April that was irritating to the farmers, that price being $2.55 basis. Some of the dealers repudiated the contract and for a time refused to take all the milk. Measures had to be taken and finally all came in as agreed.

May had its troubles but the April price was finally accepted by both parties for May. It was thought that the difficulty had been passed, but in making the June agreement it developed that a more serious situation had to be faced than at any time before. Dealers would not at first agree to any price but finally mentioned $2.43. It had to be refused. The league committee purposed $2.74. They were ignored and an attempt made to go over their heads to the directorate. The attempt failed for the directors and county presidents upheld the committee. It was considered impossible to avoid a clash and as the market conditions altered the committee advanced to $2.83 for June, figuring on a cost of production basis. The conference board appeared contemptuous. As it is now understood, certain of the dealers failed to uphold the conference board and desired terms for four months proposing to take their own course irrespective of the board. This quickly settled the crisis but not until almost the last day. Plans had been made to hold the milk on June first but this course was not necessary. The league required the settlement to be in writing and the one cent commission paid in all cases, which condition is now binding until October first.

Promoted Farmer Picnics

Summer outings, picnics, etc., are perfectly proper for farmers. They should be promoted by farmers. It may be that the local organization, such as the league or the grange, should be the promoter, or perhaps the county bureau may have a hand in it. In certain sections it has come to be customary for a creamery association buying the milk of the farmers to put on these picnics. There may be cases where this is perfectly legitimate, but in the case of some of the powerful concerns that are more or less interested in getting the upper hands of the farmers' organization such offers should be rejected.

We are fast accumulating facts from the picnics held by one of these powerful companies to show that there are ulterior motives for these. It is not altogether for the purpose of cultivating friendly relations with their patrons but to create prejudice against the league, apparently. We are told repeatedly of statements made by the speakers at these gatherings claiming that league officers are faulty and delinquent and that the dealers are always the farmers' real friends. In some cases this does no harm further than to create disgust on the part of the farmer, but sometimes it does serve to cause the farmer to feel that his affairs are not looked after properly.

I am not saying that the farmer should shut his eyes and assume that the league management is always right. No such body can always be right. It is proper for the farmer to question the acts of his agents and see if they are all that should be expected, but he is in a much better frame of mind to do this on the square before he has heard the tales of some prejudiced extremist on the platform.

The advice has been given to keep entirely away from all such picnics. In a few cases the farmers have sent formal notice, I am told, that they will attend no such meetings. In those cases there is little doubt that the notice was justifiable. It might not be in other cases. I heard a local league man make a statement, a few days ago, in one of our league meetings, of the things that the speaker had said degratory of our executive committee. One of the committee replied that he wouldn't call the speaker a liar, but would say he was completely mistaken. Mr. Gladstone once refused to call his opponent a liar, but insisted that he had made the statements that a man would make if he were lying.

MEMBERS OF "THE HUNDRED PER CENT PURE-BRED HOLSTEIN HEIFER CALF CLUB" OF DOUGLAS COUNTY, NEBRASKA, ON THEIR RECENT VISIT TO FRIESLAND FARM OWNED BY DR. B. B. DAVIS, NEBRASKA

It is not my intention to show our men always right, but to voice a caution against insidious deception and the creation of unjust prejudice.

Raising Money for the G. L. F. E.

In New York State there has been for some two or three years what is called the Grange Exchange. This had headquarters at Syracuse and under the conditions which have obtained it has done well. On binder twine and seed corn it has achieved successfully. On some other items it has been more or less successful.

It will be remembered that the league previously tried out the feed business and failed. Hardly more than that can be said of the Exchange. It had only $30,000 working capital and when the manager went into the markets to get feeds he found that he either couldn't get the feed or the price was fixed against him. In some cases the wholesaler quoted the local dealer in the town where the exchange sold feed some four dollars a ton less than he sold to the exchange in ten or twenty-car lots. In other cases the local dealer got a check for two to four dollars a ton on the car of feed that was bought through the Grange Exchange. It was evident that more money would be needed for capital.

A few weeks ago representatives of the grange, the league, and the bu-

reaus got together and decided to reincorporate at a million dollars so as to enable the Exchange to go back to the farmers' elevators in the West and buy their entire output. These elevators have been unable to sell to us in the East a car or a few cars because the big dealers gave them the same kind of dope that they gave the Grange Exchange, or worse. If our new exchange can protect the farmers' organization in the West and can buy of them, then further if they can buy gluten and cottonseed and linseed oil meal from some concerns in a way to protect them, it is quite possible that they may buy as well as any wholesaler or jobber. When that comes about our dairy farmers can be supplied as well as any dealer.

The problem right now is to raise the necessary money for this new exchange. Sums have been assigned to the various counties to raise. The counties assign to the various townships and committees in those townships go to work and raise the necessary money. In our county we are assigned $30,000. Our county league meeting distributed this to the various towns, my own town getting just about the average, or $1,500. Now we get out our committees and go to the farmers. The stock is for $5 a share and the stock bears six per cent interest. We hardly made a booming success at our county meeting, being able to raise only three thousand out of the thirty thousand. Not many subscribed even two hundrd dollars. It is going to take a good deal of work to sign up the whole amount. A few counties have already gone through the whole deal. Orange did not even stop at $30,000 but made it $40,000. Of course, we did not have a large number present, and also, of course, we are going to raise every cent of our quota.

In many cases the leagues hold regular local meetings. In most cases they will hold special meetings to take up and explain the exchange and appoint committees to raise any balance that may be lacking. It is important that this shall be done now as soon as may be if we are to get the business doing something next winter. It is possible that we may be a little late to get all the benefits for 1920—21, yet considerable can be accomplished from now on. The manager of the old Grange Exchange has done very well and his experience will be of great help. There are other experienced men connected with the G. L. F. Exchange.

New York Dairy News

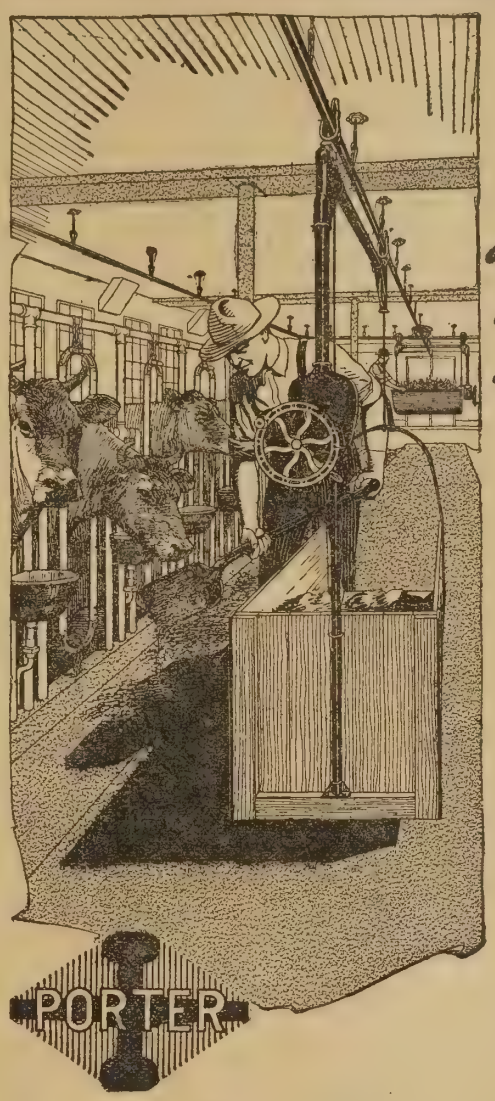
Coal Shortage:—Many creameries and milk plants in New York and nearby states are being handicapped to a considerable extent by the coal shortage. Some plants which were holding contracts for a season's supply at $6.75 per ton were unable to procure it and were obliged to go on the market and pay $11 per ton at the mine in order to continue operations. The dealers claimed they were not to blame as they were unable to get the contracted coal from the mine. If this condition continues, some of the milk and cream shippers are talking of an advance in the charge of pasteurizing in order to compensate for the extra costs entailed by the increased price of fuel.

Cheese Prices:—The cheese price of 25¼ cents, which has been in effect in northern New York for two weeks, was not changed in the meeting of the Gouverneur Dairy Board Saturday, July 10.

The offerings were 3,665 large and 644 singles. One year ago the sales were 4,274 boxes and the price 31 cents.

Twenty-five and a quarter cents was announced as the regular price for cheese on the produce exchange, Saturday afternoon at Watertown, but payment of the usual premiums will bring the actual cost above that figure. Their offerings showed 7,385 boxes.

The Cheddar type skim and part skim cheese have met a very dragging sale so far this season which has placed the dairymen and manufacturers at a decided disadvantage. Those who sold their season's output under contract were fortunate. Most lots are going direct to storage. The difference between special skims and special whole milk flats has lately been from 6 to 9c per pound, whereas for a few years previous it was not uncommon to have special skims sell within 1½ to 3 cents of the top of the market.



Some concerns that usually make very fine part skims at this season are not now making a box. They state that casein at 12@12½ cents per pound pays better and factories that own the equipment are now making the casein.

Production of cheese in the western part of the state is very light this year. The regular factories are running lighter and the milk stations that produced cheese heavily a year ago, are making practically nothing.

Big Order from Germany:—A contract for 125,000 cases of condensed milk, of 48 cans, each weighing 14 ounces, has been received by the Dairymen's League of New York from Germany. The local plant of the league in Auburn has started to fill this big order. Other co-operative plants of the state will also work on the contract. The order from Germany is the first contract entered into for American products since the war ended and was effected through the American Relief Association. The Auburn plant has been making powdered milk chiefly and the foreign order has amazed and interested hundreds of farmers who have shares in the co-operative association. It was promised them that this industry would be one of the biggest possible in the dairy line and present developments prove that it is rapidly becoming a far bigger thing than the men who backed the movement a year ago ever dreamed of.

New York. E. M. L. BLANCHER.

The Fadless Barn Equipment

PORTER equipment — fit for the finest show barn — is built first of all for the homely, everyday job of keeping the cows clean and comfortable, and lightening the barn work.

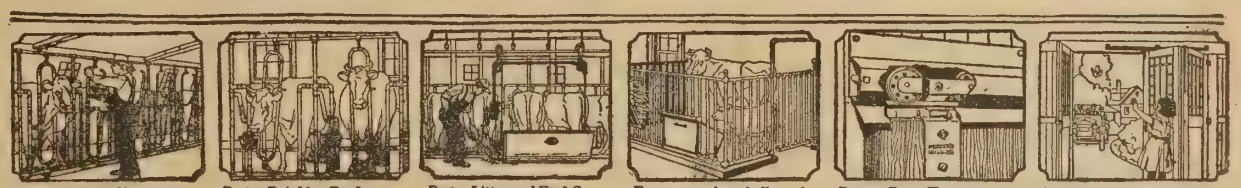
¶ You'll find it free from fads and attachments—no "special features" which serve merely as "selling points."

PORTER

"Dependable Since Sixty-Eight"

products are built to ***use.*** They're as common as your old corn planter—and as practical.

¶ But if you are one of those business farmers who are dairying for profit, if you buy your barn equipment for utility, as you do your farm implements, you'll like the Porter line. It includes every product you'll need to make your barn modern, convenient and profitable, and to keep yourself and your workmen contented.



¶ You'll find a world of pleasure in your light, airy, Porter-equipped barn—a pleasure that will be keener because you know that you are giving your cows every chance in the world to make good; that your barn is as well equipped and as well regulated as the most modern factory; that you are producing dairy products as clean and wholesome as is humanly possible; that you are realizing a profit in keeping with the years of effort and anxiety you have invested.

¶ The cost is not large. The interest on complete Porter equipment for each cow runs only 50c or 75c a year.

¶ Thousands of good dealers sell Porter equipment because they believe in it and can personally recommend it. We'll gladly send you our catalog or Barn Plan Book and tell you where you can see Porter products.

Lowe's

How much too much
is your barn painting
costing you?

Putting the paint on is the big cost of painting. Don't forget that.

A paint that spreads easily will be spread farther. It will be spread farther, just because it is easier to spread it. A paint that covers easily and thoroughly, takes less brushing to make it cover.

Lowe Brothers' Paint goes farther and costs less to make it go. Sometimes it costs more per gallon, but always it costs less per job.

Talk to the Lowe dealer in your town; or write to us for a booklet called—"Figure Your Painting Costs with a Brush—Not a Pencil."

New York Butter Market

NEW YORK CITY, JULY 27:—The 44,392 casks of Danish butter and 10,854 casks of Holland butter which were unloaded last week have had a marked effect on the butter market during the past week and undoubtedly the influence of the foreign butter will be felt for some days yet. While large quantities of the butter were carted directly from the ocean freighters to storage warehouses and while several thousand of the casks were shipped to adjacent cities, much of the butter is being used by local receivers to supply current demand. As the Danish butter is selling at 54 @55½c, and the Holland butter at a yet lower price it has worked a hardship on domestic butter. At the present time, the market is passing through a slump such as has not been seen before this season. While there has been no great decline in price, there is very little trading and receivers are finding it difficult to finance their businesses as much butter is being received, for which remittance has to be made promptly, and they have found it necessary to place large quantities of their butter in warehouses to make room for the incoming stocks. Banks are curtailing their loans, even to the houses with large financial backing, for the simple reason that money is not plentiful. Receivers have not seen a similar condition for many years.

There has been a slight shrinkage in receipts during the past week or ten days, which, of course, is seasonal. However, reports from the regions of greatest butter production indicate that production will keep up longer than usual this year as the summer has not been hot and there has been a liberal supply of rain in practically all sections of the country. Many receivers are viewing the conditions which prevail at present with considerable alarm as they feel that there will probably be a period of marked depression in the market during the month of August. Their process of reasoning is this: Production will continue at a higher level than usual during August. Speculators will cease operating within a few days, as they prefer the June and July make of butter to that of August for storage purposes. If the speculator ceases to be a factor in absorbing the butter that is now arriving there is bound to be an accumulation of butter in stores in August with a resulting decline in prices. Then, too, local demand will be low as a greater number of city dwellers are leaving the city this year than has been known for some seasons. That condition will continue throughout August, which must have a deleterious effect on the market. The unsettled question at present is: Should the receiver at present force the sale of the butter which he has on hand?

Last week opened with an advance of prices and the market was fairly active. On Monday, the foreign butter was beginning to arrive on the market but it was felt that it would have no permanent effect on the market and both receivers and buyers did not look for a decline in quotations. However, by Wednesday a weakness developed and on Thursday the price fell ½c. That was followed by a similar decline on Friday. While the tone of the market was unsettled on Saturday and Monday of this week there was no change in quotation, but the close student of the market suspected that another decline was imminent as the market was very inactive. A further decline of ½c followed today and there is practically no activity and the market can be said to be very weak. Receivers are scurrying about to find funds with which to finance their holdings so that it will not be necessary to force sales which would have a tendency to ruin the morale of the market. The situation can not be said to be at all satisfactory. Established quotations are: Extras (92 score), 55¼@55½c; higher scoring than extras (93 score or higher), 55¾@56½c; firsts (88—91 score), 52@55c; and seconds (83—87 score, 49@51c.

W. B. LIVERANCE.

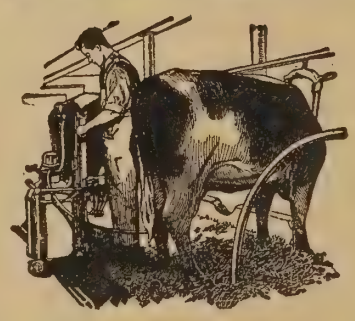
Jersey Cattle Notes

For week ending July 16:

Number of animals registered: Bulls, 281; cows, 710; total, 991. Numbers of transfers recorded: Bulls, 303; cows, 1,240; total, 1,543.

Have You A Little Spare Time?

Have you a car—or a horse and buggy?



HOARD'S DAIRYMAN would like to offer you a proposition to look after our subscription interests in your community during your spare time.

It would be light, pleasant work among your old neighbors; and we can make it really profitable, too.

Write and tell us about the territory around you and how much you could take care of, and we'll make you a proposition.

Hoard's Dairyman, Fort Atkinson, Wis.

PAGE MILKER

$123!

Yes, and *no installation expense! Run by hand.* At last, a milker for the farmer with 6 to 12 cows. One-fourth the work of hand milking. A child can operate it. Does the work on small herds just as the most expensive power outfit does on very large herds. Even if you have a large herd and need engine power, here is a chance for you to find out at small cost what machine milking can do for you.

Engine Power, too—

For 16 cows or more:—Any time within a year you may trade in hand power machine for a Page Engine Power Milker—no pipes, no special pails, no pulsator. A superior milker at *great saving in price!* Get our catalog:——

Try It!

Send for free catalog and information about the Page Milker. *Arrange to have a demonstration on your own herd.* —try it yourself—no installation, no extra cost of any kind. Write today.

BURTON-PAGE CO.
Dept. C462 — 9 So. Clinton St., CHICAGO, ILL.

Copyright 1920, by The Goodyear Tire & Rubber Co.

"Your Goodyear Cord Tires on our truck go right through the plowed ground of our citrus groves, permitting loading at the trees, and they protect the fruit, particularly the lemons, which are very delicate, by smoothing the haul to the packing house. They save labor, fruit, time."— H. J. Kelly, Packing House Manager, Charles C. Chapman Ranch, Fullerton, California

IN rural hauling like this and in farm duty radically different, the use of Goodyear Cord Tires on trucks has been found productive of a variety of important advantages.

Their traction has increased truck utility for farmers, ranchmen, fruit growers, dairymen and others, particularly owners of motorized farms, by enabling easy hauling through soft fields.

Their cushioning has effected continuous savings in the marketing of delicate vegetables, fruit, dairy products and of eggs and livestock, all of which suffer on slow, jarring solid tires.

Their nimbleness often has accomplished more hauling with less driving and resulted in a quicker feeding of power machinery while releasing hands and saving time for farm work.

Throughout extended terms of service these virtues have been delivered with the stout reliability developed in Goodyear Cord construction by manufacturing methods that protect our good name.

Farmers' various accounts of their successful use of Goodyear Cord Tires on trucks can be obtained by writing to The Goodyear Tire & Rubber Company, Akron, Ohio.

Where Farming Is Profitable

Farm lands in the South have not been boosted by speculation. Why buy a farm in a high-priced section and cripple your future with debt when you can buy a better farm in the South for one-third the price? Don't you want a farm where climatic and soil conditions are unexcelled? It is our business to help you find just what you want. We know Southern lands and land values and it is to our interest to locate you where you will succeed and make business for the railroad. There is no charge for our service. For full information call on, or write to J. C. Williams, Manager, Southern Railway Development Service, 1302 Pennsylvania Ave., Washington, D. C.

Research Work of Dairy Division

(Continued from first page.)

udder and other parts of the lacteal system.

There is no doubt of the fundamental character and far reaching value to the industry of this work which Professor Meigs is carrying on. In the estimation of the writer it bids fair to rank beside the pioneer work of Professor Henry and others, and the more recent work of Dr. C. V. McCollum and associates in the studies in animal and human nutrition, for there is no doubt that an intimate relationship exists between the value of the various proteins in a dairy ration, and the value of similar proteins in the human ration.

In addition to this work, there are extensive breeding experiments in progress at Beltsville. A project now in the fourth year, and planned to cover many years longer, is designed to test out the results of line breeding, and of cross breeding. This project has passed beyond the capacity of the Beltsville farm, and several colleges and experiment stations are now co-operating, the Beltsville farm furnishing the bulls, some of the cows, and tabulating all records. Another breeding experiment is going on, closely related to this one, to develop, if possible, a strain which will positively transmit proven production capacity; that is, eliminate the "throw backs".

Reference was made at the beginning to other projects of great importance. Brief mention can be made of the development of a Swiss cheese industry in this country, now past the experimental stage, and in working order in several states. Another project subject even yet to a vast amount of discouragement and ridicule is surely winning out by sheer merit—the utilization of skimmilk. This started as a war-time conservation project, when it was found what a vast waste of skimmilk took place in the nation as a whole. Millions of pounds, it was stated, actually went to waste, while other millions were fed to animals, for which there was other available food, while this most excellent food was needed by starving humanity. So, in spite of ridicule, this work was started and is today one of the big projects of the Dairy Division. The manufacture of cottage cheese in the butter factories, using specialists to inaugurate the work, is the method used, and the whole project was first of all worked out to an absolute success in the Department creamery and cheese factory plant at Grove City, Pa., which makes thousands of pounds of cottage cheese which is marketed in Pittsburg and elsewhere. Supplementing the work on manufacture, came a big public campaign for the use of this wholesome and most valuable food product. It is today wherever it can be bought in an economical package, according to Professor C. W. Larson, dairy expert of the Division, one of the best and most nutritious foods within reach of the American public.

Other phases of the skimmilk conservation include the study of the manufacture here of the Italian cheeses, the manufacture of an albumen cheese, and the recovery of the albumen as a distinct and valuable and palatable food product. This last project has gone through to the point where a method has been perfected and patented to prepare a dried albumen. The development of the whey butter and the sugar of milk industries are too well known to need comment here.

I do not think it is amiss to state here that the total government appropriation available for the Professor Meigs' work on the physiology of milk secretion and nutrition of dairy cows is only $8,000 a year, and that from year to year only. Dr. C. W. Larson, in discussing this, points out that this is the equivalent of a corporation with two billion dollars invested in machinery upon which its entire output was dependent, spending only eight thousand dollars in the study of its machinery and promoting efficiency in production. This is a good comparison. The necessities in the way of supplies and material, to say nothing of the personnel, are so easily understood that it seems incredible that the work can be done at all within this appropriation. In a similar, although perhaps less pointed, way, this is true of all the work in progress.

This brief summary of what is in progress in these lines is, in a way, an anticipation of definite and complete reports which will be issued soon and continued from time to time. My purpose will be fully carried out if dairymen generally will become interested in this work, express their interest to the officials in charge, get in shape to receive and profit by the results which will be announced, and then back their interest and their approval by such definite expressions as will lead to adequate support of the worthy undertakings of this branch of the Department work which is clearly and wholely in the interest of the owners, breeders, and milkers of dairy animals.

Butter and Cheese at the National Dairy Show

The new class made for storage butter at this year's National Dairy Show has, judged by the entries made, received a splendid start—the indications being that the class will grow into the greatest favor and enjoy the largest increase of any of the butter classes next year, taken from the expressed regrets of those who delayed in making their entries this year.

The butter judges for the 1920 National Dairy Show are Mr. O. A. Storvick of Gude Bros. Kiefer Co., New York City, and Mr. C. W. Fryhofer of the Bureau of Markets in New York.

The butter entries close October 2nd, and the butter must be on hand at that time, as well as the entry form properly filled out. There is great delay each year and consequent mishaps to entries because the buttermakers do not follow the rules and give the matter of entry and shipment proper attention.

The cheese judges are: For Foreign cheese, Mr. Fred Marty of Monroe, Wis.; for American cheese, Mr. E. L. Aderhold of Neenah, Wis., and Professor W. W. Fisk of Cornell.

The cheese entries close at the same time as the butter—October 2nd, and there is promised a very large and interesting competition in cheese at the next show.—Publicity Department, National Dairy Association.

It is never too late to learn—to drink milk.

DUTCHESS, A PURE-BRED JERSEY OWNED BY HARRY WHITING, WEST VIRGINIA

This cow leads in the testing associations in that state with a month's production of 1,500 lbs. milk containing 84 lbs. fat.

REPUBLIC TRUCKS

Republic policy of Service to the Owner is founded on the conviction that Service is the truck owner's most vital requirement. Two thousand Service Stations cover the country, backed by seven National Parts Depots, making Republic Service definite, and assuring Republic owners everywhere uninterrupted performance.

Capacities: 1, 1½, 2½, 3½ Tons

Republic Truck Sales Corporation, 933 Michigan Ave., Alma, Michigan

HELP WANTED

Wanted—Experienced herdsman, married, for herd of forty Holsteins. Must know calf rearing and be able to get results. Modern James equipment, running water, electric power, Sharples Milker. Cream sold. Residence seven rooms on small, beautiful lake. One mile to city. Salary $100.00 per month with free house, electric lights, running water and furnace heat. Must board two or three men greater part of year, proper allowance made for same. A good place to make good. Our present herdsman receives promotion. Answer fully as to age, experience, etc. FLORENCE FARM, Florence, Wisconsin. 3-2

Testers Wanted—Experienced men for cow testing association work. Can pay as high as $125 per month and expenses. Write C. S. RHODE, University of Illinois, Urbana, Illinois. 3*

Wanted—Man to drive wholesale milk truck from farm to Minneapolis, do milkhouse work and help to milk. Don't apply unless experienced. Seventy-five dollars per month. J. C. CAMPBELL, Hopkins, Minn.

Wanted—Two single men, one for milk route and one for barn and milk house work. No cigarettes. Our equipment is modern and complete throughout, including litter carrier, drinking cups, milking machines, etc. Willing to pay good wages to right man. State wages expected and give references in first letter. LONE TREE DAIRY, Sidney, Mont.

Wanted—Reliable man who can produce results to take charge of registered Jersey herd. Honest wages and bonus. BROOKE STONER, Hanover, Pa.

Help Wanted—Reliable married man without children to work on small farm. One who can milk. Wife to do general housework. Good wages and entire maintenance. MORGAN HEIGHTS SANITARIUM, Marquette, Michigan. 3-3

Experienced herdsman and feeder at once for one of the best Guernsey herds in Wisconsin. Must be experienced in feeding for high records and able to treat common ailments of dairy cattle. Familiarity with Guernseys desired, but not necessary. Single man, twenty-seven or older preferred. State age, nationality, religion, wages expected, and full account of experience in first letter. H. L. STOUT, McCormick Bldg., Chicago. 3-2

Wanted—A first class man for general farm work about Sept. 1st. Excellent wages to right man. Nice six-room house, garden, etc. GEORGE CURTISS, Stockton, Ill. 3-2

Wanted—Good dry hand milker, barn work only. Herd pure-bred Guernseys, doing testing. Address F.W. DUBOC, Herdsman, Fairydale Farm, Pawling, N. Y. 3-2

(Continued on page 91.)

Milk Inspectors Meet

The ninth annual convention of the International Association of Dairy and Milk Inspectors will be held in Chicago during the period of the National Dairy Show, October 11, 12, and 13. Morning, afternoon, and evening sessions will be held. Good educational matter regarding the supervision and control of milk supplies will be heard.

IVAN C. WELD, Secretary.

A woodlot without a good stand of young trees coming on to take the place of the old ones is like a family without any children. What is going to become of it?

Born 12-14-19. Dark fawn, white points, solid head. Fine type. Sire, King Masher 5th 18361 A. R. Dam, Glenwood Girl of Springfield 2d 42759 A. R. with 12,978.4 milk, 662.25 fat at 3½ years. Price $250. Write for pedigree.

Broad Acres, Springfield Center, N. Y

Will Sell at Auction

August 17, 1920

My Entire Herd of 36 Head of Holsteins

Fairview Dairy, Pittsburg, Kansas

OKLAHOMA BULL CALVES

from 4 to 16 months of age, well marked, straight and guaranteed right in every way. Several sired by a 32-lb. son of "Champion Echo Sylvia Pontiac" from Ormsby dams. Prices reasonable. Photo and pedigrees on application.
BOSTWICK & SON, Ardmore, Oklahoma.

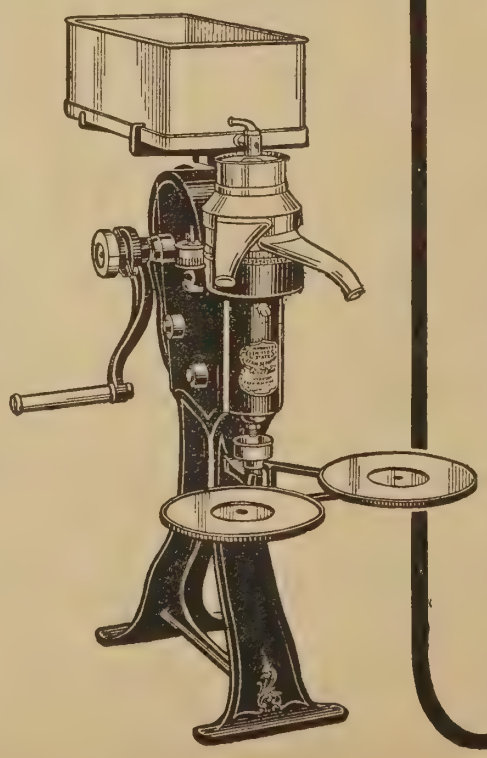
protect your cows against the usual run down physical condition due to the excessive heat and short pasturage—a condition that always results in a marked falling off in milk production.

You can't afford to let your cows run down now. If you do, your Fall and Winter milk production will be curtailed.

The Missouri Agricultural Experiment Station in circular No. 44 says: "When hot weather and short pastures come the milk flow drops one-half to two-thirds, and the cows are almost dry at the beginning of winter. It is almost impossible to restore the flow of milk to the original amount after it is once allowed to run down from lack of feed. To make large returns from the cow a large yearly production must be had, and to do this the flow of milk must be kept up ten or eleven months in the year.

SCHUMACHER FEED AND BIG "Q" DAIRY RATION

fed regularly when cows are on pasture, increasing the amount as the pasture gets shorter, will keep your cows up to normal production right through the hot Summer months. These ideal feeds will also supply your cows with added vitality to withstand the withering heat of Summer and bring them up to the Fall and Winter season physically fit to give you maximum production. Write for our interesting dairy folder, "LONG TIME MILK PRODUCTION AND HOW TO GET IT." It's FREE.



The Quaker Oats Company
Address, Chicago, U. S. A.

Belle Alto Farms Accredited Herd of 80 Guernseys
For Sale:—Grandsons of King of the May 9001 and out of A. R. dams. One bull calf, price $150 and three ready for service, $250 and $300. An opportunity for the best kind of a foundation. BELLE ALTO FARMS,

Wanted To Buy Jerseys

A few bred heifers or young cows. Tuberculin tested and subject to sixty-day retest. State particulars and prices in first letter.
White Acres Farm, Marshall, Minn.

UNITED STATES CREAM SEPARATOR
WITH PERFECTED DISC BOWL

Perfection—

Is it too much to expect?

A machine may be said to have reached perfection when, through mechanical and engineering excellence, it renders a degree of service in money- and labor-saving never before attained.

Years ago, the United States Cream Separator reached the peak of perfection as a money saver, by winning in open competition the world's record for close separation—a record that still stands.

The perfecting of the United States Disc Bowl is the last big achievement in cream separator building. With this notable refinement, the labor-saving features of the United States challenge and welcome all comparisons.

Those who know the ease of operation, the simplicity of cleaning, say the United States represents perfection in the most important detail of milk handling.

Write for literature today—but be sure to have the United States dealer near you show the machine itself.

Vermont Farm Machine Corporation
Bellows Falls, Vt. Chicago, Ill.
Salt Lake City Portland, Ore. Oakland, Cal.

Tri-county Holstein Club

About 125 people enjoyed the summer picnic of the Tri-County Holstein Club, July 22nd at Bluffton, Ohio. The meeting was held in a beautiful little grove on the farm of Wilbert Schumacher, the secretary of the local calf club. The excellent herd of Mr. Schumacher's was inspected by the party and it was the general opinion that he still has several more in his herd as good or better than the two he sold recently in the Ohio State Sale for a total of $1,210.

After the bounteous picnic dinner the meeting was called to order by President Chas. E. Jameson, who called upon Professor W. H. Palmer, Boys' and Girls' Club leader for Ohio. Professor Palmer in a clear, concise way outlined the method of procedure for organizing a pure-bred Holstein calf club and its advantages. It resulted a little later in the forming of such a club—the calves to be six to nine months old, good individuals with just as much breeding as it is possible to get.

Dr. H. B. Gooding, Tiffin, Ohio, President of the Ohio Holstein Association, gave a short talk emphasizing co-operation among the breeders of Ohio and the importance of keeping the boys and girls on the farm.

Howard Barker, Ohio's Field Secretary, outlined the plans and projects of the Ohio Holstein Association. "In order for the Ohio Holstein Association to be a success," said Secretary Barker, "it is necessary that every county have a well organized county club, and it is the purpose of our state organization to do whatever we can to help organize county clubs and promote them."

Professor R. B. Stoltz in charge of the dairy manufactures at Ohio State University talked to the ladies on "Cheesemaking on the Farm" and gave to them some very interesting and valuable information.

This club is a live one and Holstein breeders of Ohio as well as the United States will continue to hear from them. H. C. BARKER.

California Milk Consumers

HOARD'S DAIRYMAN:—The trouble between California Federation of Housewives' Leagues and milk distributors over prices was no sooner settled this spring than more trouble began brewing. Now it is announced that on August 1st the distributors will inaugurate an advance of two cents a quart on the retail price of milk; and the housewives' associations are not only taking steps to fight any such increase but are demanding that the present price of 15 cents be reduced to 14 cents. The California Federation maintains that a sufficient margin of profit exists at present to cover any increase which may result to the producer in the higher costs of feed and labor.

At present the members of the joint milk committee, which includes Oakland, Berkeley, San Leandro, and San Francisco, are busy framing a program to fight any proposed advance in the price of milk to the consumer. The Richmond Housewives' League has also gone on record as determined to oppose any increase. The Oakland Housewives' League has already addressed a communication to the Producers' and Distributors' Association urging that milk be offered at 14 cents a quart in all the bay cities instead of the present price of 15 cents. This is said to be just a forerunner of what the producers and distributors may expect if they attempt to raise the present price to 17 cents on August 1st, as threatened.

Definite action has also been taken by the bay cities toward ascertaining the cost of milk in order that they may intelligently pass on the proposed request for an advance of two cents per quart. A fund is being raised for employing a certified accountant who is to examine the books of East Bay milk distributors with the object of securing figures regarding cost of feed, labor, overhead charges, etc., in order to arrive at a basis for setting the retail price of milk. Louis Bartlett, mayor of Berkeley, the originator of the plan, says:

"The threatened rise in the price of milk will most likely be put into effect within a short time. We have no correct figures dealing with the cost of distributing milk and therefore we do not know whether the increase is just or not. It will cost us $500 a month to hire a certified accountant to find out. Berkeley will pay $150, Oakland $175, and Alameda $75 toward this fund for a period of six months."

Charles E. Hewes, city manager of Alameda, intimates that when this data has been secured it will not only enable them to judge as to the merits of any proposed increase in the price of milk, but will also furnish them a basis on which to lay plans for taking over the distribution of milk in the three bay cities.

As an off-shoot of this investigation the housewives have discovered that one of the possible reasons for the increasing cost of milk is the loss of bottles through carelessness on the part of customers who fail to return them. A campaign has been started to induce milk users to be more particular about returning all milk bottles. It was also pointed out that in many cases the drivers are partly responsible for being lax in requiring the return of bottles. It was discovered that there is a state law forbidding any one throwing milk bottles in garbage cans and cases were cited where Los Angeles residents were prosecuted under this law. With this movement, the producers' and distributors' associations are heartily in accord.

Oakland, Cal. L. L. D.

Help Is Scarce—
Will Your Silo Stand Empty?

SILO filling time is here. How are you going to get your ensilage harvested and put in? Take a look at that cornfield. Size up the other harvesting to be done right now, and the help you have. What are you going to do?

THE RONNING ENSILAGE HARVESTER is the answer. If you act at once, it can solve your silo-filling problem.

Dairy farmers all over the United States ordered RONNING months ago. You would certainly have placed your order if you had known about the RONNING earlier. Even now we will try to take care of you in time for harvest if you place your order immediately.

Harvest Ensilage at Half the Cost

In one operation the RONNING completely harvests your ensilage from reaping the standing corn to loading the cut ensilage into the wagon-box. Three men and three boys with a RONNING can put up as much ensilage in one day as ten to twelve men can the old back-breaking way. From standing corn to cut ensilage packed away in the silo in thirty minutes—the RONNING is making this possible on many farms. It has a capacity of 70 to 100 tons of ensilage a day. It cuts the cost for labor, horses and time in half.

Write or Wire At Once

With silo filling time upon you, you can't afford to delay. Every day you wait makes it harder. There is a distributor near you who may be able to ship you a RONNING in time for this season. We will put you in touch with him and send complete information. Write or wire us at once. There is no time to lose.

American Harvester Company

1738 Central Avenue **Minneapolis, Minnesota**

RONNING ENSILAGE HARVESTER

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

The Season of Fairs

The time will soon be here again when everyone spends a few days at the county fair. It is a great place, isn't it, boys and girls? Lots of fun and so many things of interest to see. But don't forget the fair will be just about what the people of the county make it and you happen to be among the people of your county. If everyone is interested, then there is bound to be a good fair. I don't mean just interested to go and see what the other fellow has done but just interested enough to do something for ourselves. You want to learn about new things, then you should be willing to give the other fellow advantage of seeing and learning about the things you do. That is one of the best ways to learn.

Now, there is only one way to do this at a fair and that is to exhibit or show the results of some of your best work in the department which will be open for your entries in the shows and fairs this fall. This should be one of the things uppermost in your minds from now on. We don't want you to miss it and that is why we are telling you about it now. Surely, every club boy and girl expects to exhibit. But it doesn't make any difference whether you belong to a club or not, you can exhibit something anyway. But think about it and lay your plans carefully for making the best exhibit you have ever made. Even if you have already won first money and blue ribbons, there is a chance for you to improve, for to be sure no one has yet reached his ideal in the samples he has exhibited before.

No boy or girl need sit back and say, "I wish I had something to exhibit" for there are so many things to show at a fair. Farm products and stock of all kinds are always included among the exhibits and to be sure, there is something on your farm or in your garden which would make an addition to any junior department of the show. Those who have already exhibited know something about how to put up exhibits. But there are always those who are entering for the first time and it is for these boys and girls that this article is especially written.

The Exhibit in Corn

The corn club boys and girls are bound to exhibit in this class and even if you are not a corn club member, perhaps you can exhibit from dad's stock of corn. I am sure he will let you and he will do all he can to make your exhibit the best. Exhibiting corn is easy but there are a few fundamental things which we must look after when we select ears for the show. The rules for corn exhibits usually say there shall be ten ears in a sample. Now one of the most important things about a sample of corn is to have it represent some standard variety such as Golden Glow, Silver King, Early Yellow Dent, Murdock, Clark's Yellow Dent, Wisconsin No. 25, or perhaps Smut Nose Flint. When the judge goes over the samples he has certain things in mind and these are the things which you should have in mind when you make up your sample.

1. It is of prime importance that the ten ears which you exhibit should be sound and mature.

2. That they are all alike as near as possible so that the sample will be uniform.

3. The ears should be pure. That is, they should show no mixture.

Here is a good way to begin. Select a good type ear for the variety you are exhibiting. One that is good size but not oversized, good shape, straight rows, well formed kernels, no mixture and the tip covered as good as you can get it. This will be the ear that should guide you in the selection of the other nine. So look out what you pick for the first ear because this is the ideal and the others will be matched up to this as nearly as possible. If you do this you are bound to have a nice uniform sample. Nowadays, boy and girl corn growers know so much about corn that they are fully aware that it is rather difficult to keep corn pure when there is more than one variety being grown in the neighborhood. Corn mixes so freely. We must not take it for granted that a variety of corn will keep itself pure because the contrary is quite the case. You can usually locate ears of corn that have mixed kernels.

AN ATTRACTIVE GRAIN AND VEGETABLE DISPLAY

If it is a white variety and it has crossed with yellow corn, then the kernels are bound to show some signs of yellow if they are mixed. This is the way to locate them. Hold the ear in good light and look down between the rows of kernels and if you are careful you will be able to discover any kernels which are mixed. On the other hand, if it is yellow corn you are exhibiting and it is mixed with white corn, the tips of the kernels will look quite white. In either case these ears should not be taken because the judge will say, "this fellow has fallen down on a very important point." Corn for shows must be pure. So look over the ten ears carefully in this respect. Sometimes it is a big temptation when one finds an ear that is very good in other respects but that shows a little mixture, to pick out the mixed kernels. If you do that the judge will be suspicious at once. The kernels should all be present on the ear, and then it would hardly be fair to make up this kind of a sample and that is one thing that we must pledge ourselves to do when we expect to exhibit. We should play square.

But there is such a thing as dressing up a sample of corn before showing it, just as one dresses up and tries to make himself look his very best when he is going to have his picture taken. All of the husks and silk should be very carefully removed so that the ears look clean. Don't leave any pieces of husks sticking between the rows, and the ears should be clean too. That is, there should be no dirt left on them. The shank of the ears should be cut off close to the butts. These are some of the things that I mean by dressing up the sample.

There is usually a class for exhibiting single ears. If you enter this class be sure that you take the most stylish looking ear that you can find, one that is just as near perfect as you can get it. Now, perfection in an ear of corn means some of these things. An ear that comes near to being perfect, first of all, must be well prepared and must be good size for the variety. The kernels should be uniform, the rows straight, the tip and butt covered, the color good and bright, and there should be no mixture. It never pays to select an ear for size alone as some people do. I have known boys and girls to be very disappointed because they didn't win the prize just because they had the largest ear in the exhibit. Size is only one thing and there are others which are much more important. It is not a difficult matter to make up good samples of corn and so we believe that the corn feature of junior exhibits should be well filled.

Exhibiting Pedigree Grains

Usually in the class of pedigree grains the boys and girls are not very well represented. This isn't as it should be, for it is not difficult to make a good sample of grain for show. All you need is grain that is good quality to start with and then a little dressing up will fit it nicely for the show. Oftentimes there is nothing set in the rules of the show as to how much grain shall be in a show sample. If you are in doubt, never exhibit less than a peck. This will show off much better than a quart or a half peck and it makes a much better impression on the judge. Quality is the one thing to look out for. Plump kernels of good quality and color, clean and free from weed seeds, other kinds of grain, chaff, and dirt are the things to look out for. The first thing to do in preparing a sample of grain then is to see that you have good plump grain. The second thing to do is to clean it up thoroughly so that there is nothing present but the grain itself. You cannot be too careful about this. The judge will not stand for weed seeds in a show sample, nor does he like to see chaff and dirt and pieces of sticks present. It might be a good plan after you have cleaned it up as thoroughly as possible to spread the peck of grain out on the table or on a clean floor and look it over carefully so that you can remove any weed seeds which have not been taken out with a fanning mill.

But this is only a part of dressing up the sample. The container in which you exhibit will either add to or detract from the appearance of the sample. Grain samples are best exhibited in nice, clean, white sacks, grain pans, or neat boxes. I really believe that a judge is liable to be influenced by the container in which a sample is exhibited. He is very liable to hurriedly pass over a sample exhibited in a dirty sack no matter how good the grain is. In exhibits of any kind neatness should always be one of our mottos.

Perhaps you have planned on exhibiting some grain in the sheaf. That is a mighty fine idea because sheaf samples of grain when properly put up are very pretty to look at. Most shows nowadays offer prizes on sheaf samples. There are just a few things to know in order to make a good looking sheaf sample of grain. The straw should be left full size and should be stripped clean of the leaves and the heads should be arranged in an attractive way. This does not mean that they should be arranged in any peculiar design. A sheaf sample which is about three or four inches in diameter just beneath the head is large enough. Some people make a mistake by making the samples look too clumsy. Then there is another important point and that is the way the sheaf sample is tied. I have seen sheaf samples of grain that were very good in all respects excepting the matter of tying. Binder twine and white cord should not be used. It is best to use narrow ribbon, either red or yellow in color, or narrow tape of these colors will do. The sample should be tied just as many times as is necessary to make it firm. Usually three or four times is enough—once beneath the heads, once or twice near the middle and again near the butt. The ties should be tight and there should be no ends left on the ribbon or tape. Consequently it is best to tie in a hard knot instead of a bow and cut off the ends of the ribbon.

When a judge awards the prizes and ribbons to sheaf samples he does so upon these points. Quality of grain, attractiveness of the sheaf, and the color of the straw.

Garden Products

Many juniors who have nothing else to exhibit can usually find something in the home garden that would be worth while preparing and, because so many of us are interested in gardens, this class in the show should be well filled. An attractive vegetable display is interesting to everybody and there are some things to know in order to make a garden product exhibit look its best. I am sure there is big opportunity for improvement in this class.

First of all, no matter what the ex-

Learn to be an Auctioneer

Taught by the practical method. By our plan you study at home and receive a part of the commission while learning. Enroll now and be ready for the fall business. Write for our free catalog. Address
Kissling's Auction School of America, Indianapolis, Ind., Dept. F, William O. Kissling, President.

hibit is, quality must never be sacrificed for quantity. Over-sized, coarse vegetables may be interesting to look at but it is seldom a judge awards the prize for size and coarseness, nor does he award prizes for freak-shaped vegetables. It is a great temptation to exhibit the over-sized carrot or cabbage but as a usual thing these over-sized individuals do not have the quality which will win the money. Nor should a few large individuals be exhibited with a number of smaller ones to make up the sample, but look out for quality first of all.

Then the samples should be sound and marketable. Disease spots will count against the sample and here is an impotrant point. Vegetables such as roots like carrots, beets, turnips, and potatoes should be clean. This doesn't mean that they should be scrubbed with water before they are shown. It is rather bad practice to scrub these root vegetables with water in preparing them. It is much better to use a soft brush which will remove all of the dirt. This will usually clean them up sufficiently. It is very seldom that water needs to be used. On the other hand, if the dirt is difficult to remove with a dry brush, then rather than exhibit a dirty sample I would say, wash them very carefully so as not to injure the skins. This is especially true, in speaking of potatoes. Root crops show soft and natural color much better when the dirt has been merely removed with a dry brush. Keep the sample just as uniform as possible, the same as you would in making up a ten-ear sample of corn.

A Matter of Education

Every show should have its educational advantages and hence should be instructive to the visitors. If you put up the right kind of an exhibit it may inspire some other boy or girl to also exhibit some other time. If your samples are good it may be the best advertisement you can get for the sale of your product. Remember, we are not showing just for the fun of trying for a prize. There are some other things to keep in mind as well and I think an exhibitor who exhibits partly to educate has the right idea. With this in mind, all the samples which are exhibited should carry a neat label telling just what each is. For the other fellow is very liable not to know what he is looking at unless it is labeled. And it is well to make your own labels too. If you refer it to someone else, they are not liable to be well made. Labels are best made on small white cards. They should be plainly written or printed and only the necessary words to describe the exhibit or tell what it is should be used. Judges notice all of these little things which add to the appearance of a sample, so let's be careful in this matter as well.

Junior Letters

Hoard's Dairyman Juniors:—Papa and I replanted corn this morning. We haven't had any rain for about three weeks and the ground was getting very dry. If it does not rain tomorrow we are going to plant tobacco. I now have thirty-eight little ducks. My two old ducks have laid 128 eggs. I have 32 setting now. I feed the little ducks chopped onion tops and corn meal dampened and they surely like it. We have a pond on the place that is full of tadpoles. The ducks go down there and surely have a fine time.

Papa bought three little heifer calves in Washington two weeks ago. They are Holsteins which have not been registered as yet. We are feeding them on calf meal and they are growing fine.

Maryland. Alfred J. Heine.

Hoard's Dairyman Juniors:—I will tell you about my calf. Her name is Alfa. She has not been bred yet. We find it is best to wait and breed heifers when they are about 2 years old. We have about 15 acres of corn out. We had a tractor to plow for us today. We have a now corn plow; it is fine.

Wishing the juniors good luck.

Illinois. Floyd Nidey.

Hoard's Dairyman Juniors:—I am 11 years old and go to a school of six pupils.

We have 35 head of stock, calves of all, excluding four horses and two pigs. We are milking twenty-four cows of which I milk seven.

I own a calf which cost me twelve dollars. I give it five quarts of milk a day but I am cutting her down gradually to one quart.

This morning I hitched my calf, Jeff, who is named after Jefferson, to a little cart with a rope. I helped her at first to pull my brother but she started like the wind. She went around the corner and knocked the carriage and all head over heels.

If any of the juniors want to write to me my address is R. F. D. 1, Jefferson, N. Y.

Alfred E. Eisenhardt.

Hoard's Dairyman Juniors:—I am through with my work so I thought I would write. I would be very glad to become a Hoard's Dairyman junior and receive a fob, button, and creed. My father's name is Latimer Bixler, my age is 13 years and our favorite dairy breed is Guernsey.

My pigeons are doing fine. I have about 25 pairs all colors. Most of them are brown but some are red. I have 5 pairs of white ones, the rest are spotted. My father tends market and then he takes them along for me to York. I get from one to two dollars a pair for them.

My letter is getting rather long so I think I will close for this time.

Pennsylvania. Clark E. Bixler.

Hoard's Dairyman Juniors:—It is very hot here. It is now 5:00 p. m. and 82 degrees in the shade.

I have 65 Plymouth Rock chickens. I have sold my rabbits and am going to buy a Hereford calf with the money. Papa sold 10 of his cows last winter, averaging about $125 apiece. We are milking seven cows now and will be milking 14 by fall. We have 6 small calves.

Our cows are on sweet clover pasture and like it fine. We raised over $20,000 worth of seed last year.

I will close wishing the juniors good luck and write me. My address is R. F. D. 2, Stuart, Nebr. Lyman Jillson.

Hoard's Dairyman Juniors:—We are two boys of 7 and 9 years of age. Our father is a breeder of pure-bred Holstein-Friesian cattle. We have to feed the calves night and morning and we also have 10 sheep and 7 lambs which we have to watch morning and night while they are feeding. We like to take care of the sheep and calves and see how fast they grow.

Walter and Harold Rabenhorst.

Wisconsin.

Hoard's Dairyman Juniors:—It has been some time since I have written. I am fourteen years old and will be a Sophomore in Kinsman high school next term. I live on a small farm in northeastern Ohio. There are 75 acres, 35 tile drained and the remaining 40 in pasture. I have a goat whose name is Nanny. She has gray hair and is rather small for her age. I keep her merely as a pet.

I have a small truck garden. I try to keep it clean but we are having rather wet weather here and the weeds grow pretty fast. Our chickens will be out of the shell by Tuesday. They are all White Leghorns. We have 800 eggs set in two incubators. I have engaged fifteen chickens as soon as they are ready to leave the brooder. I think I will raise them and sell them this fall.

I have bought four pigs from my father. They are half Berkshire and half Chester White. I think I would like caring for them very much. I will keep account of the cost of feed, etc., and when I sell them I can tell just what my loss or gain is as the case may be. If I am successful this year I will try again.

I would like to work out some this summer but my garden and chickens and pigs will take some of my time. Besides there is considerable work at home here for me to do. I milk four cows which are all Jerseys. We also have a 12-24 three-bottom plow tractor.

Won't some of the juniors write me? I would be delighted to hear from you. My address is Kinsman, Ohio. Ector Ogilbee.

Hoard's Dairyman Juniors:—I have been hoeing corn about all this week for my father.

In your letter you asked about my setting hen. Well she hatched 11 chickens but one died.

I am going to sell my steers this fall I guess. They are growing pretty well.

In my garden I have corn, beans, potatoes, turnips, and tomatoes. My father planted two acres of sweet corn and over one acre of fodder corn. I have been hoeing in my own garden tonight.

I wish the juniors good luck.

Maine. Horace Hopkins.

Hoard's Dairyman Juniors:—I have been reading the junior department for some time and would like to join. So this is my first letter.

I am 13 years old. I have been on a farm for three years so I don't know much about it. Last year I joined the pig club and won $23. I went in again this year, too. With the money I won last year I bought a sheep which had a lamb which is quite big now.

We are putting in hay this week. On the fourth of July our corn was over the tongue of the cultivator.

My address is R. F. D. 1, Janesville, Wis.

James True.

Do You Belong to the Juniors Club?

If you are a dairy farm boy between ten and eighteen years of age, and if your father or some member of your family is a subscriber to HOARD'S DAIRYMAN, we want you to join the HOARD'S DAIRYMAN Juniors Club.

The Juniors Club consists of several thousand boys like you, banded together to help each other get more pleasure and profit from farm life, and to have the advantage of associating with other boys who live and work and think as you do.

It costs nothing to join the club—and there are no dues. All you need to do to join is just to fill out the coupon and send it to us. We'll at once enroll you as a member and send you a watch fob, a coat lapel button, and the "Dairy Farm Boy's Creed". Do it now—then you'll soon be a full fledged member of the HOARD'S DAIRYMAN Juniors Club.

COUPON

HOARD'S DAIRYMAN Juniors,
Fort Atkinson, Wisconsin.

I want to join your Juniors Club. My father's name is _____.

I am _____ years old and like _____ (name breed) cows best. Send me the watch fob, button, and creed and enroll me as a member.

Name _____

P. O. _____ State _____ R.—

The rate for advertising in this department is 10 cents per word. Count address. Remit in advance. Copy must reach us 8 days ahead of date of issue. Farm labor advertising 7c per word.

STOCK FOR SALE

I have usually 100 head of registered and high grade Holsteins on hand for sale. Also registered and imported Percheron and Belgian horses. RALPH HUDSON, Milton Junction, Wis. 12*

For Sale—At Elmwood Stock Farm, high grade Holstein cows and young stock by the carload. JOHN MURPHY, Mukwonago, Wis. 3*

240 acres, mostly alfalfa, plenty of water, buildings in good repair, a bargain if taken at once. Possession to suit the buyer. Want to sell direct and save middle man's profit. Do not write, but come, I mean business. R. D. LEE, Cazenovia, N. Y. 3-3

FARMS FOR RENT

For Rent—Dairy farms. We are adding two more farms March 1, 1921. They will be operated as pure-bred Holstein farms. Tenants to furnish horses, machinery, all labor. We furnish the land and capital for one-half the cattle and, if necessary, will back the right man for most of the capital necessary to purchase his half of cattle on such liberal terms that the cattle will pay for themselves. This is a great opportunity for the right man—especially if he has experience in making records—to become associated with the largest pure-bred Holstein organization in the country. Fertile farms, good location, milk factory market. Selling organization that relieves you of all care or worry about the selling end. In fact, the chance of a life time. Please give full particulars about yourself and your references in first letter. WOODLAWN FARM, Sterling, Ill. 2-2

For Rent Live Stock Shares—Two-hundred-acre dairy farm. Renter must have cash for equipment and own help. ALVIN GREENE, Morris, Ill.

Why the Waterloo Boy Gives Maximum Power At Drawbar and Belt

The engine of any tractor will deliver its maximum power only when shaft and axle bearings run without friction. Friction means wasted motor energy.

The Waterloo Boy Tractor is equipped with heavy-duty roller bearings. Friction is reduced to the minimum. Engine efficiency is increased. Maximum power is delivered at drawbar and belt.

The small shaded portions in the above illustration show the exact location of the heavy-duty Hyatt bearings on the Waterloo Boy. They reduce friction, thus giving maximum drawbar and belt power. All the gears shown above are enclosed in a dust-proof case, and run in oil.

WATERLOO BOY
BURNS KEROSENE COMPLETELY

Eleven Hyatt roller bearings are used on the Waterloo Boy. Three are on the engine extension shaft which operates the belt pulley, and carries the high and low speed gears. Two are on the intermediate shaft, whose gears transmit tractive power to the differential. Four are on the differential shafts, which drive the tractor, and two on the rear axle, carrying the rear weight of the outfit. These particular bearings have an established reputation for their special ability to reduce friction and conserve power.

The Waterloo Boy engine is placed crosswise on the tractor frame. This eliminates bevel gears. Bevel gears cause friction. Waterloo Boy drive is direct through straight gears, another power-conserving feature.

There are many other superior features of Waterloo Boy construction and operation. Its simplicity and accessibility, its powerful 12-25 H. P. engine, its ability to burn kerosene and burn it right, a pump, fan and radiator cooling system, all contribute to make the Waterloo Boy an especially good tractor for your farm.

We have a booklet describing the Waterloo Boy fully. You will want to read it. Address John Deere, Moline, Illinois, and ask for booklet WB. 714.

John Deere Implements, and Waterloo Boy Tractors and Kerosene Engines are distributed from all important trade centers. Sold by John Deere dealers everywhere.

"Nothing Like It"
says the Good Judge

A little of this real tobacco gives a man more satisfaction than he ever got from the old kind.

The full, rich, real tobacco taste lasts so long, you don't need a fresh chew nearly as often. That's why it costs you less.

Any man who uses the Real Tobacco Chew will tell you that.

Put up in two styles

RIGHT CUT is a short-cut tobacco

W-B CUT is a long fine-cut tobacco

Weyman-Bruton Company, 1107 Broadway, New York City

The Grange on Politics

The National Grange has issued the following statement which is of interest to farmers generally:

"The Washington office of the National Grange has been called on several times to take part in political contests, either where present members of Congress are being opposed by so-called farmer-labor coalitions, or are being favored by farmer organizations.

"To all such calls there is but one reply, and this statement is issued that there may be no possibility of a misunderstanding, reiterating the substance of what was stated in a previous bulletin issued from this office two weeks ago. The Grange, whether in its subordinate bodies, its county, or its state, or its national organization, does not participate in partisan politics. The organic law of the grange prohibits a grange from taking part in political nominations or during its sessions discussing political candidates. This organic law governs the National Grange as well as the smallest subordinate grange. It applies to the grange in any and every organized form, and to every grange officer acting in a grange capacity.

"Guided by a clear understanding of this rule of conduct, the Grange has refused to enter into co-operative relationship with other organizations seeking political results, or with any labor organization. There are two reasons for this. First, the principle of refraining from political activities. Second, the clear belief of the Grange that just now labor organizations are guided by narrow motives of class selfishness, and led by radical leaders seeking political changes detrimental to the principles of our government, and to what the Grange conceives to be true Americanism.

"The principle upon which the Grange rule is based in this political action should grow out of unselfish consideration for the greatest good to the whole people; not the selfish interests of a class or group. The Grange as an organization, therefore, refrains from joining any partisan appeal, or any group coalition, and is opposed to principles and to candidates for any purpose other than the best interests of the whole public.

"Least of all will the Grange enter into the most objectionable of all political activities, the dealing and dickering between the parties, threatening class opposition, or playing one against the other, with the promise of influencing votes in large blocks to the party or the candidates who promise them most. That form of non-partisanship is the opposite of the principle which actuates the Grange 'the greatest good of the greatest number'. It is deliberately calculated for the special benefit of the best organized minority. The Grange as an organization refuses to be drawn into partisan politics. Its individuals are left free, and are urged by every teaching of the order to exercise every privilege and every duty of citizenship, and to do so in freedom guided by their own individual judgment.

"A newer generation not familiar with the history of the 'groundswell' of the seventies, or the 'Farmers' Alliance' of the eighties, is now active in public affairs. This wave of farmer activity in politics which is now at its crest is neither novel nor different. The Grange has lived through two such experiences, witnessed the rise and wane of these efforts, measured their results, and has seen its own organization and membership weakened by the failure to achieve anything tangible. It is sound judgment, based on the 'wisdom of the past' that keeps the Grange out of politics now. History proves that the fraternal, educational, social, and co-operative efforts of the Grange win far more for country people and country life than political activity or political office. For fifty-three years the Grange has fought for wise legislation, for sound policies of government, and for honest and economical administration, willing to let the electors of the nation chose the men to make and administer the laws, without the attempted domination of any class, clique, or group of the citizenship."

Alfalfa Seeded in Corn

HOARD'S DAIRYMAN:—In the last Hoard's Dairyman an inquiry is made about seeding alfalfa in corn. We have just seeded alfalfa in our corn. This is the third time we have done so. We do not recommend this as the best method, but we cannot seed in grain nor can we afford to miss a crop. The corn should be well worked early and kept clean. Cultivate the last time with a harrow-tooth cultivator and seed with a wheelbarrow seeder. Do not stir the ground after sowing or some seed will be covered too deep. The corn is cut off for silage and the corn stubbs are harrowed down when the ground is frozen.

Wisconsin. CHAS. M. FOX.

"We Do the Best We Can"

—you expect us to earn our board and a profit for you from the milk we produce. To do this we must have the proper feed all year 'round. The feeds you put before us must be something more than just milk makers. They must build flesh, bone, meat. We must be in good healthy condition all the time.

Pasturage alone, during the summer is not the right feed for us. While it stimulates milk flows it hasn't enough of other ingredients to keep us in tip-top bodily condition to enter the winter season strong and healthy enough to keep on giving down milk in quantities profitable to you.

Feed us, during the summer a ration of

International Special Dairy Feed

The Great Milk Maker

This is a feed made from carefully selected materials scientifically blended in just the right proportions to build bone, muscle and heat as well as supplying the elements that make milk. It produces the most milk we are capable of giving down, naturally.

The men who are at the head of the International Sugar Feed Company and the men who sell International Feeds to your dealer are practical feeders. Thousands of dairy farmers all over the country are feeding *their* cows International Special Dairy Feed and making big profits.

International Special Dairy Feed is absolutely guaranteed to increase our milk flows. You can't lose. Feed us a trial ton and watch us "perk up" and make your milk checks bigger.

If there is no International dealer near here write to the Company. They will supply you promptly. Their address is

INTERNATIONAL SUGAR FEED CO.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Functionless Quarter

We have a valuable two-year-old pure-bred Holstein heifer that is due to calve in about two months. She is in splendid condition and bagging up nicely in three quarters, but one front quarter is not developing as it should though it does not seem to be entirely "bad" only is flabby and not so large as the others.

We have been massaging it daily for fifteen minutes and think it shows some improvement.

Ada, O. A. BROS.

Derangement of the nerve and blood supply of the quarter explains such a condition in many cases, but in others, and they are common, the cause is an attack of garget, often unnoticed, and induced by sucking of the teats by calves in the early days of life. That pernicious habit should be stopped the moment it is observed, else udders will surely be ruined.

Massage the quarter three times a day and each evening rub in warm melted lard containing a teaspoonful of pure turpentine to the ounce. Stop for a few days if the skin becomes irritated. If organic disease is not present, this treatment may stimulate nerve and blood supply so that the quarter will develop and yield a fair amount of milk at calving time. There is nothing certain as to that, however, and many cases of the sort prove incurable.

Sore Hand From Milking

Have you ever known of the udder of a cow "poisoning" the hand of the milker?

After a long period of milking test cows last winter that portion of the hand above the thumb and first finger began "breaking out" with fine blisters, followed by a dry "cracking" condition similar to salt rhume. At first I thought it due to the excessive use of a bag balm we were using. It was very persistent and yielded to treatment very slowly; and I did not get entirely free from it until relieved from milking. And now every time I go in on "relief" for a day or more it returns with increasing severity.

Woronoco, Mass. R. M. O.

Both cowpox and ringworm are contractable by man from an affected udder. Impetigo is another skin disease (pustular) contracted by men who handle cattle. In a condition such as you describe, however, you should at once see a specialist in diseases of the skin and have him determine what is wrong and what should be the best treatment.

Rhode Island Ayrshire Club

A representative gathering of breeders and others representing various organizations in Rhode Island interested in pure-bred Ayrshire cattle, met in Providence, July 19th, for the purpose of forming a Rhode Island Ayrshire Club. Mr. L. W. Lloyd, of the Rhode Island State College of Agriculture, explained the object of the meeting and the importance of forming a Rhode Island Ayrshire Club, not only from the standpoint of the breeders interested in pure-bred Ayrshire cattle, but for the benefit of the entire dairy industry in this state.

As explained in the preliminary call for the meeting, Rhode Island has been known for many years as having a considerable number of Ayrshire cattle on its farms. The Ayrshire is particularly adapted to the general farming conditions found in Rhode Island, with its generally poor pasturage and rough soil; the Ayrshire breed being especially noted for its hardy, vigorous constitution and its ability to thrive where some breeds would find the conditions impossible.

Mr. Clyde N. Smith, representing the National Association, outlined a plan of organization and submitted a draft of by-laws recommended. After full consideration and certain modifications the same was accepted and the election of officers resulted as follows:

Geo. H. Pettee, president; Joseph E. Fletcher, vice-president; J. Foss Magoon, secretary and treasurer; and J. F. Comstock, auditor.

Rhode Island. H. H. HAWES.

Oneida Holsteins Average $300

Thirty Holstein breeders of Oneida County, New York, united in an annual sale held July 30th. They consigned a uniformly good lot of cattle which sold at an average of $301.27. Eighteen head were sold to out of state buyers. Peter C. Petersen of Wisconsin topped the sale by paying $750 for a yearly record bull bred by Frances M. Jones. C. S. Muke, also of Wisconsin, secured four head. H. B. Sweet of New York was the heaviest buyer, taking six head for $1,890.

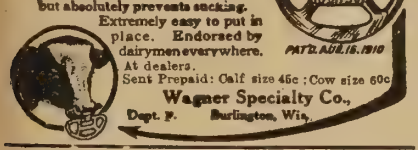
DAISY FLY KILLER PLACED ANYWHERE ATTRACTS AND KILLS ALL FLIES. Neat, clean, ornamental, convenient, cheap. Lasts all season. Made of metal, can't spill or tip over; will not soil or injure anything. Guaranteed effective. Sold by dealers, or 5 by EXPRESS, prepaid, $1.25.

HAROLD SOMERS, 150 De Kalb Ave., Brooklyn, N. Y.

No Dirt or Impurities can drop into the milk when a Non-Spill Sanitary Dairy Pail is used. A closely woven brass sieve with a non-splash rim protects the milk from contamination. The switching of the cow's tail cannot throw dirt into the pail. Flies or germ-laden insects cannot fall or crawl into the milk.

This New Pail is Spill-Tight. If it is kicked over a valve automatically closes the outlet. No milk can be spilled. This non-spill feature alone will pay for the pail several times over in one summer season by saving the milk when the cow kicks.

It Is Strong, Durable and Will Last many seasons. It is made of heavy charcoal tin plate, and holds 3 gallons. It is absolutely sanitary. Every part can be taken out and washed *clean*. Nothing is hidden or unreachable.



Your local dealer has it or will get it for you. It's a Schlueter metal product.

Dealers: Write for our special proposition. Your customers will want Non-Spill Sanitary Dairy Pails.

Trade Grade Bulls

In a recent meeting of the board of directors of the Pettis County, Missouri, Holstein-Friesian Company, the work that the government and state are doing to eliminate the grade and scrub sire was discussed. The board agreed that this was work of immense importance to the dairy industry and expressed a willingness to co-operate in the campaign. Just how to help was the question when it was suggested that we trade some of our young bulls for grade or scrub bulls. It was finally voted to offer to exchange a pure-bred bull calf to any one using on their dairy cows a beef bred bull of any breed or a grade Holstein bull if he is a year old or older. They will devote twenty-five bulls to this cause between now and January 1, 1921, the first twenty-five applicants getting them. This removes the last excuse for at least twenty-five men for not building up their herds. Even if they have cows of mixed breeding, by the use of a good pure-bred bull, they will soon have a herd of high grade cows.

To appreciate what the offer really means one should know about this great Pettis County herd. Their original cows, 100 head, were selected in Wisconsin by Professor C. H. Eckles, then of the Missouri Agricultural College, and in the last three years have been kept in a cow testing association and the poor producers weeded out. The herd has increased to 200 head. Their three herd bulls cost the company $6,000. One is Brookings Cornucopia whose dam, College Belle Wayne, produced 28.29 pounds butterfat in 824 lbs. milk in seven days, a world's record at that time. She has almost an 800-pound butterfat record in a year and three daughters with nearly equal records. This bull has 11 A. R. O. daughters and is a show bull. Another bull is Admiral Walker Prilly with 42 A. R. O. daughters. His dam was Lottie Walker Spoffard who five times produced over 24 pounds butterfat in seven days and has a record of over 25.6 pounds fat. Their other bull is a son of the King of the Pontiacs from a daughter of Tidy Abbekerk Prince. The King of the Pontiacs is recognized by all as the greatest bull the breed has ever produced, having 265 A. R. O. daughters or more than twice as many as any other bull. He also has a "44-pound" daughter and more than 30, "30-pound" daughters. Tidy Abbekerk Prince has 86 A. R. O. daughters and is considered one of the foundation families. This bull which is a fine individual cost the company $3,400 when only 18 months old. A part of this herd will be at the State Fair at Sedalia this fall.

C. M. LONG, County Agent.

Don't Take a Chance With Fire

"It never pays to take a chance with fire," says a circular issued by the Forest Service, United States Department of Agriculture, in its campaign against forest fires. "If you have got to gamble take a 'flyer' on the stock market or play the ponies, but don't take a chance on fire."

"Every thousand feet of green timber near your home is worth at least $10 in wages to you and your neighbors, besides its stumpage value to its owner. If it is on national forest land, you are part owner, and if it is destroyed by fire, you lose both values.

"Burned timber pays no wages," the circular says. "The prosperity and development of your locality is going to depend upon keeping that timber green.

"Don't take a chance with fire yourself, and don't let your neighbor do it. When you burn brush take every precaution to obey the law and see that your neighbor does. Remember that your home and his can go up in smoke from one piece of carelessness.

"The biggest fires in history were started by those who didn't think the woods would burn. Be as careful of fire as you are of powder; it's just as dangerous."

When writing advertisers please mention Hoard's Dairyman.

Successful Community Efforts in the Show Ring

(Continued from page 69)

his faith in growing animals eligible to the show ring and brings his stock in competition with his fellow breeders and under the criticism, either favorable or otherwise, by his community and the judge.

After the list had been completed a majority of the men found that the committee had selected one or several in some cases from among his herd to be fitted. This the breeder did willingly with the understanding that his winnings were to be divided 50-50 with the county club, which in turn was to provide help and feed to care for stock while on the grounds. The owner was to show his stock on judging day and to display them in the parade. Each farmer identified himself as a breeder of true to type individuals through representation of his herd, and advertised himself as a breeder by placards displayed near his stock.

Anyone visiting the Green County Fair last fall would have thought he had lost his way when he entered the grounds. Almost unknown to himself he was following the crowd which seemed to be elbowing and pushing its way toward the dairy barns. Here he found every stall filled. Imagine, if you please, the tops of some thirty or forty herds represented in various classes fitted and groomed to perfection, every animal a fitting contestant for the ribbons and their owners in friendly rivalry glibbly discussing the outcome of the morrow's judging.

Friday found Professor G. C. Humphrey, College of Agriculture, who judged the stock, fairly mobbed by interested spectators while he worked from early in the morning until well into the afternoon placing the winners. Take the aged bull class with seven contenders for honors. Then the "get of sire" and the sire and his get with twenty-eight representatives, a class seldom found in county fair lists. In short, using Professor Humphrey's own expression, "the entire Holstein exhibit would have fared well at the state fair."

What caused this transformation? To ask this question and then not to answer it would leave too much in doubt and probably reflect unjust criticism on the heretofore passive disposition of the breeders themselves. In short, to co-operate is to strengthen. The same efforts that have been exemplified in the operation of the co-operative Swiss cheese factory which has spelled success for the dairymen since the manufacture of cheese had its inception into the county brought success in co-operative showing of stock at the fair. Each breeder caused his efforts to be unified with those of his neighbors in furthering through the County Holstein Breeders' Club the breeds' best interest.

The Board of Directors at a special meeting in the spring revised the fair premium list which had become obsolete from lack of use. Too often, as was the case with this premium list, many premiums are offered that afford nothing to encourage the exhibitor. To induce a breeder to show an aged bull, for example, and to popularize that class was to add the "get of sire" and the "sire and his get" with commensurate offerings for this class. With the revision and re-classification of the list came the responsibility of justly filling and providing entries. Many times breeders are too busy to give the necessary time to the showing of their stock at fairs. Some men are utterly lacking in the knowledge of what constitutes a fit contestant for honors in the ring, which fact brings about the necessity of co-operative showing under competent direction. Therefore, in fairness to the exhibition as a whole some discrimination must be affected which insures success along this line. It is unfair to exercise this just prior to the opening of the fair since it results in dissatisfaction and dissension among the breeders showing. Take the matter of fitting, many men do too much a day or so before the opening of the fair and too little at an earlier date. When one stops to figure the importance a competent judge places on the matter of quality, conditioning, and general conformation it behooves those in charge to lay plans well in advance of the fair. Over 175 head in the parade, decorated with their respective winnings and preceded by the band, made this day one to be remembered by the exhibitors and cherished by the officers of the fair who had given the stock show their loyal support.

Community breeders' clubs could adopt some such plan as this to make their fairs successful and as a booster for their particular breed. Considerable breed rivalry already exists in some counties and a very creditable showing of stock could be affected by each community fitting and showing its particular breed and vieing with each other for honors at their local fair. The state fair and finally the National Dairy Show should later find the winners of each local fair contending for the highest honors.

Tractor Ignition Difficulties

(Continued from page 68)

wrong, except to remove it when the tractor is to be stored. However, any careful workman may take the magneto apart and put it back in good shape.

The farmer has got to become as familiar with his tractor as he is with the milk sheet if he is to get the most out of it. When the magneto goes back to the factory for repairs, nine times out of ten all it needs is a good cleaning and maybe a carbon brush or two. Such repairs take an hour or two and the job costs the farmer a good big sum.

SWINE

Alfamarl Springs

Offers for sale Rex of Alfamarl Springs by Union Star, a richly bred Yeksa bull whose dam, Reunion made 576 lbs. fat at three years; out of Goldie Belle, a good daughter of Tricksey's Sam. He is ready for service.

Economy in Production ← GUERNSEYS → Quality of Products

Guernseys produce large quantities of milk and butterfat when given a fair chance. For example, ten leading cows average 19,960.96 lbs. of milk and 997.56 lbs. of butterfat. Send for our free booklets.

THE AMERICAN GUERNSEY CATTLE CLUB, BOX H 74, PETERBORO, N. H.

The Second Southeastern Guernsey Breeders' Sale

to be Held at Salisbury, N. C., Aug. 12th, 1920

In Co-operation with Rowan County Guernsey Breeders' Ass'n

This offering will consist of thirty-five selected Guernseys, and will come from four different states and about twelve different herds. These animals were selected by a Committee and are pronounced the best bunch of Guernseys ever offered at public auction in the South. They are from herds all under Federal inspection and every animal is guaranteed a breeder. There will be five bulls, whose dams average over 600 lbs. of fat each, and thirty females from six months to four years of age. Among them are daughters of some of the best bulls of the breed and granddaughters of the sensational Guernsey bulls. Two granddaughters of King of Chilmark, one of them bred to a son of Chilmark; eight granddaughters of Itchen Daisy's May King of Langwater, a granddaughter of Dolly Dimple's May King of Langwater, granddaughters of Ne Plus Ultra, granddaughters of Border Raider, and some of the very choicest Guernseys from the best herds in the Southern States. Three splendid heifers bred to a son of King of Chilmark, who is full brother to Lady Du Chene.

We feel that all Guernsey breeders will be interested in the kind of animals that will be offered in this sale and would suggest that you write early for catalog to

WOODCREST SIR CLYDE FROM A 33-LB. AND 970-LB. DAM

His 18 A. R. O. daughters, headed by a 30-lb. 3-year-old, and including 13 2-year-olds from 20 to 25 lbs., average 22.01 lbs. butter at 2 years, 10 months.

A son of the great Alma Clyde, whose yearly record of 970 lbs. butter from 22,560 lbs. milk, was debarred from 8th Ass'n prize, 1911-12, and who is dam of a 30-lb. daughter and three great sons. His sire's dam, former world champion from 7 days to 6 months.

Three daughters sold at auction the past season averaged $2,050 each.

Write today about one of his good sons from a yearly record dam.

Ready For Service

Iowana Pontiac Homestead 267584, a son of OAK DE KOL OLLIE HOMESTEAD 85529, and therefore a brother to Piebe Laura Ollie Homestead King, (5 20,000-pound two-year-old daughters). His dam, Iowana Aaggie Pontiac Fayne, is a daughter of SIR JOHANNA FAYNE 42147, (8 20,000-pound daughters) has a record of 22.9 pounds in seven days as a four-year-old and is now doing well on yearly test. Her dam is a great foundation cow with over 750 pounds butter in a year. Buy him now as he will undoubtedly be worth more money when his dam finishes her year. Price $750; send for pedigree and photo.

Our herd is under Federal Supervision.

IOWANA FARMS, - DAVENPORT, IOWA

Do You Want

A 30-lb.—1000-lb. Ormsby Bull?

If you want one of that kind—and a real individual, write for our sale catalog. We are moving our herd to California and rather than take these bull calves we are offering them at sacrifice prices.

They are sons of Sir Ormsby Skylark, the sire of Duchess Skylark Ormsby, and they're from cows with records of from 27 to 40 lbs. that either have or are making good yearly records. (Several of those dams have over 30 lbs. and will finish the year well above 1,000 lbs.)

Better write today for that sale catalog.

A SON OF THIS GREAT SIRE

AT THE HEAD OF YOUR HERD WILL MEAN DOLLARS IN YOUR POCKET

MATADOR SEGIS WALKER, Jr. 6-year-old

DON'T OVERLOOK THIS YOUNGSTER

E. T. 1061. MATADOR SEGIS WALKER HARTOG. Born 4-27-19.
This young bull is 90% white. His sire is MATADOR SEGIS WALKER, who at the present time has 29 tested daughters, and still a Junior 6-year-old bull. We have over 125 of his daughters in our herd and about 50 will freshen during the year, from which we expect great results. 28 of his daughters in two-year-old form average 20.08 lbs. butter from 405.59 lbs. milk. 3 of his daughters in three-year-old form average 30.03 lbs. butter from 531 lbs. milk. His first three 2-year-old daughters to finish yearly work averaged 798.68 lbs. butter from 20,761.5 lbs. milk. We predict MATADOR to be one of the youngest century sires of the breed.
His dam, HAZELWOOD AAGGIE HARTOG, has a very creditable record of 24.94 lbs. butter in 7 days. She will freshen again in May and is a very good prospect. We will run her for a year. She is a very good show animal, very large and weighs 750 lbs. In fact, she is one of the good foundation cows in our herd. She is beautifully marked, just as straight as a string, the real dairy type, and her son is a chip of the old block. Don't overlook this bull, for he is going to make some one a great future herd sire.
Price on him for immediate sale $750.00

Head Your Herd With a Bull!

Get a son of King Superba out of one of our good cows. King Superba's offspring won first and second in get-of-sire and calf herd at the Wisconsin State Fair, 1918. His four daughters sold in the Waukesha Sale, Nov. 1919, averaged $959. King Superba's dam was the first cow to be strictly officially tested for the entire year. She produced 1231 lbs. butter, 26,433 lbs. milk as a four-year-old. She has twice produced over 33 lbs. butter in 7 days. If you wish to combine individuality and production, head your herd with a Son of King Superba. We now offer a number of his choice sons, serviceable age and younger, out of dams with records up to 24 lbs. Several of the dams are on yearly test. Don't wait. Come and see them now.

BAIRD BROTHERS, WAUKESHA, WISCONSIN.

The Wisdom of Keeping Strictly Dairy Cows

The class of cows that should be kept for dairy purposes is well illustrated by a farm survey made by P. H. Ross, county agent of Leavenworth County, Kansas, in which he states: "Blood will tell." The greatest producers and the most profitable producing cows always have been and always will be of dairy breeds, bred to produce milk and butter economically. Fifty-nine farms included in this survey were dairy farms, and the comparison with other breeds in producing milk and profits, showed $38 more return for the Holstein-Friesian per year per cow than the other breeds, and more than three times as great an income per cow as did the dual purpose cows.

Send for the valuable Holstein booklets. They are sent free.

The Holstein-Friesian Association

101 Hudson Street, Brattleboro, Vermont.

BEECHER WYTHE 2ND

Butter 7 days 19.65, milk 534.6 at 15 years of age, 75 days after freshening; 19.1 lbs. butter, 548 lbs. milk, 109 days after freshening.

At 14 years of age, Grand Champion Cow of Indiana 1918; 22,554 lbs. of milk, 800 lbs. of butter, as a ten-year-old. Dam of 12 consecutive heifer calves and one bull calf. Nine A. R. O. daughters.

2 Serviceable Bulls For Sale

Sired by King Colantha Lyons, a 35.68-lb. son of King Lyons, out of a 29-lb. daughter of King Segis.

No. 1. Born April 18, 1919. Two-thirds white, nicely marked, good individual. Dam: 16 lbs. butter in seven days at 24 months. His grandam, Beecher Wythe 2nd. This cow has produced over 100 tons of milk and is now nearly 16 years old, is still milking at a great clip. Price $500.

No. 2. Born March 11, 1919. Five-sixths white, good individual. His dam, 13 lbs. butter at 2 years. Price $250.

A Good Consistent Pedigree

Isn't it worth more than a high record or two in a weak pedigree, which shows no certainty of transmitting Production?

We offer *3 SERVICEABLE BULLS* with good solid pedigrees.

No. 1—Double grandson of 40-lb. sire, from a 22.6 Jr. 2-yr.-old, 7 nearest dams average 23.7, all above 21 lbs. No. 2—Son of No. 1, A. R. O. dam, 15 nearest dams average 21 lbs. butter, 520 lbs. milk. All tested. No. 3—Yearling sired by No. 1, 7 nearest tested dams average 23.46. Priced for quick sale.

BROOKENS BROS., PARKER, S. DAK.

FOR SALE AND EXCHANGE

25 head of Holstein cows, 23 of which are high grade and 2 are registered. Also herd bull, a grandson of K. S. P. A., the fifty thousand dollar bull. This bull is from a 27-lb. cow. Most of these cows bred to this bull. All young cows and well marked, good heavy producers. Price $200 per head if the herd is bought together. Will take two good teams of draft mares or mules as a partial payment. Might consider a good automobile as a partial payment.

G. A. HIGGINBOTHAM, ROSSVILLE, KANSAS.

Larro-feed

THE READY RATION FOR DAIRY COWS

Larro Brings Prosperity to the Dairy Farm

The dairymen who feed Larro are unusually successful because they are operating on a *certainty*.

There is no chance involved in feeding Larro because the Larro guarantee reproduced below means just what it says—you get more milk or you get your money back.

This is the same guarantee of more milk which has stood back of Larro for seven years. To the man who is not yet a Larro user it is an absolute promise of better results from his cows—to the veteran Larro user it is double assurance that Larro today is the same as it was in the beginning—that its quality will never be changed.

At last—a truly-balanced dairy feed!

Pillsbury's Dairy Ration

A Pillsbury product with a Pillsbury guarantee

We Were Interested In Scientific Feeding

For years we have followed with interest the scientific feeding of the dairy cow. Her milk yield—and therefore her value—depends to a great extent upon the feed given. Three factors must be considered: the greatest milk production, economy of production, and the health of the cow.

Feed Should Maintain Health Of Cow

We have long felt that the third factor, the health of the cow, has, in the past, received too little consideration. Feeds have been mixed with the sole idea of obtaining high milk records. Not enough thought has been given to the necessity of replacing the wasted tissues worn down under the strain of the 7-day or yearly test.

So We Added Mineral Salts

In mixing Pillsbury's Dairy Ration we have made allowance for this tremendous drain on the animal by adding certain mineral salts. These salts have been combined with the other ingredients in just the right proportions to aid digestion, maintain the constitution and vitality of the cow, and insure healthy calves.

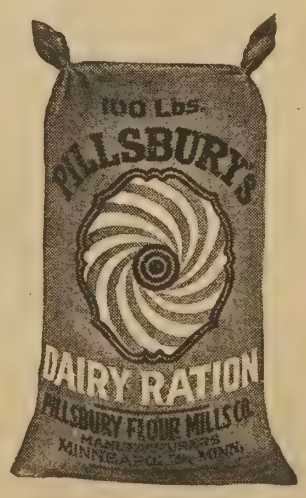
Proved By Tests—A Perfect Ration

When our laboratory tests assured us that we had the correct proportions of protein, fats, carbohydrates and mineral salts, when we knew that our mixing machines were mixing the various ingredients so thoroughly that analyses of different samples tallied exactly; then—and not until then—we took the feed to several of the largest dairy farms in Minnesota for *actual cow tests.*

The tests proved that here at last was a real feed. The cows liked it, production increased almost immediately, feeding costs came down and every feeder was enthusiastic. All realized that we had produced a remarkable feed. Read our guarantee.

Maintains Every Cow At Greatest Milk-Producing Capacity!

Pillsbury's Dairy Ration will bring every cow into a full flow of milk and ***keep her there*** during the entire lactation period. *This we guarantee.*



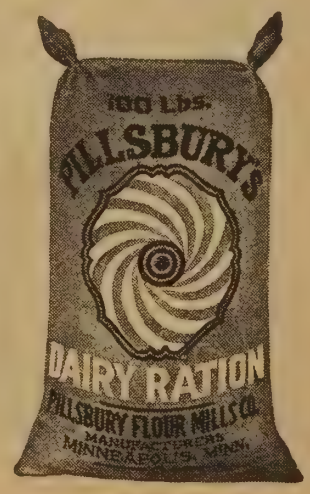
As one Minnesota dairyman put it, "I believe that if Pillsbury's Dairy Ration will not increase a cow's milk yield to the point where she returns a profit to her owner, she should be disposed of."

The Reputation Of Pillsbury Is At Stake

You would naturally expect an exceptional feed from Pillsbury. Pillsbury's Dairy Ration maintains the Pillsbury reputation for quality.

It is a clean, honest dependable feed. In competition with other feeds, both commercial and the uncertain "hand mixed" variety, it has proved its worth, time after time, both in volume and economy of production.

Pillsbury's Dairy Ration contains no "filler" of any sort. It is all feed.



Pillsbury's Dairy Ration Contains:

Ground Oats, Wheat Bran, Hominy Feed, Linseed Meal, Standard Middlings, Corn Gluten, Cotton Seed Meal, Mineral Salts, ***and nothing else.***

Guaranteed Analysis:

Crude Protein	19%
Crude Fat	4%
Crude Fibre	11%
Carbohydrates	50%
Mineral Matter	6%

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

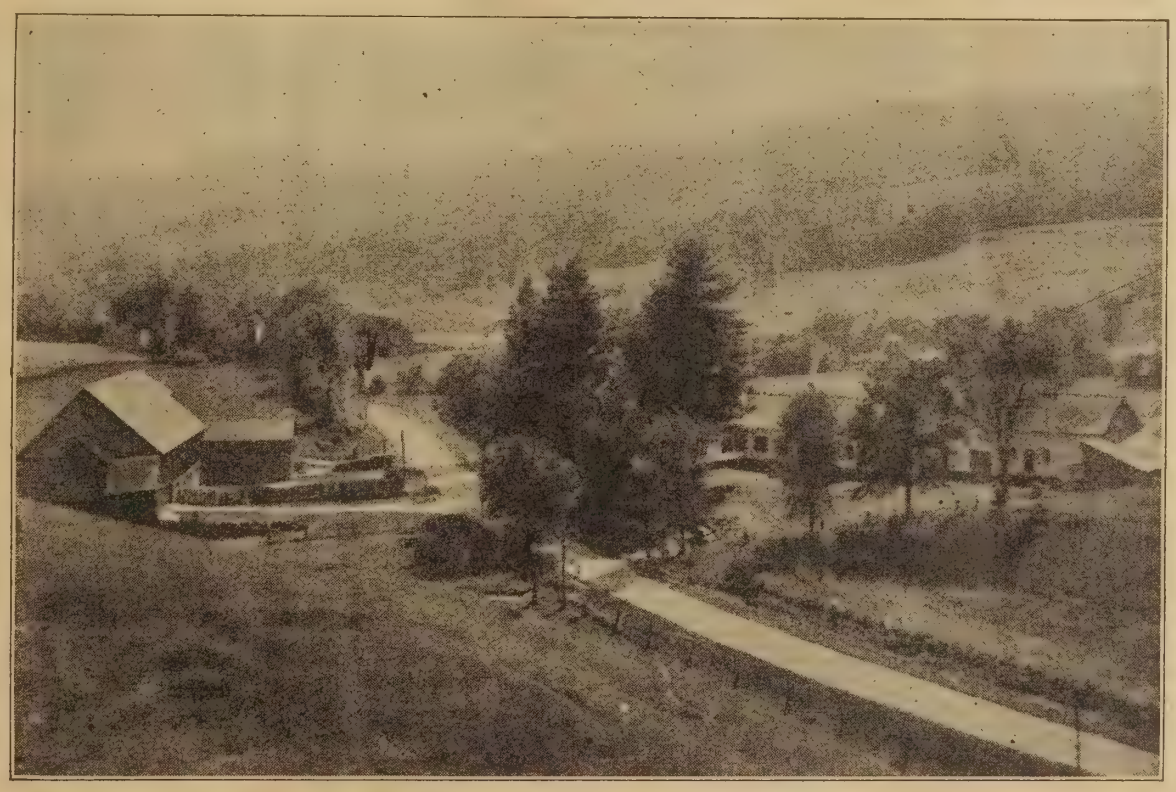
Volume LX | FORT ATKINSON, WIS., AUGUST 13, 1920. | Number 4

California Dairy Council Meets

SAM H. GREENE, SECRETARY

CALIFORNIA Dairy Council held its first annual convention during June. It was a two-day affair. Elaborate preparations had been made by the local committee and a program of unusual interest was given. This program was arranged so as to touch upon the four great questions in which the dairying industry throughout the United States is interested—production and quality of product, education and health of people.

The following seven directors were elected to fill expired terms: J. H. Gwinn, Banker of Petaluma; L. W. Wilson, Ice Cream Manufacturers; H. F. Robb, Milk Dealers. Directors G. M. Brown, Ed. H. Webster, D. M. Dorman, and W. B. Hopkins were re-elected. At the conclusion of the business session the convention convened and elected the following officers for the ensuing year: President, John Denman, dairyman, Petaluma; vice-president, Geo. E. Platt, Los Angeles, dairyman and president Los Angeles Creamery Company; secretary-manager, Sam H. Greene; assistant secretary, Mrs. Cynthia Price.



The educational program opened with an interesting and instructive talk and demonstration by Dr. C. L. Roadhouse, who displayed milk, butter, and cheese of both good and poor quality and explained in an extremely interesting and clear manner the relationship of the treatment of milk on the farm to the quality of the product. At the conclusion of his address a short recess was taken to enable the audience to sample both qualities of product. Dr. Roadhouse was followed by Professor C. V. Castle, the title of his address being: "The Relation of Production and Consumption of Dairy Products to General Agriculture". He demonstrated to the satisfaction of his hearers the dependence of general agriculture upon dairying and pointed out graphically the necessity for the development of wide consumption and of economical production. Professor Castle laid great emphasis upon the losses caused by the keeping of large numbers of low-producing cows. They are a loss to everyone on account of the extra labor required and they are a factor in keeping down consumption because of high prices. They are an expense to the dairymen in the matter of labor and of large quantities of feed which they eat but do not pay for. Professor Castle made the assertion that if one-third of the cows in California would be put out of the way, the dairymen of the state would be making much more money than they now are. He made the point clear, however, that this could not be done because of the rights of the consumers in the matter, but pleaded for a rapid extension of cow testing associations and the use of pure-bred sires as a cure for the present situation.

Mr. E. F. Moran, a representative of the San Francisco Milk Dealers' Association, read an exhaustive paper upon the problems which surround the distributors of milk in large cities. Mr. Moran's treatise was highly entertaining and instructive. He said in part: "The milk distributors of a large city are in the position of a buffer state. On the north they are bounded by the ever increasing cost of production; on the east by the constantly increasing wage of labor; on the south by the increases in the price of bottles, and of cans and tanks and caps and machinery and operating expenses; and on the west by a threatening army with banners bearing in letters of flaming red the legend: 'The price of milk must be reduced'.

"Fifteen years ago, when I became attorney for the Milk Dealers' Association of San Francisco, there were about 180 persons, firms, and corporations delivering milk in the city. Today, fully ninety per cent of all the milk delivered is handled by not more than a dozen different concerns, each of which is the result of a combination of former distributors.

"In reviewing the course of the business for the last decade it is interesting to note that with the development of sanitation as applied to milk both on the dairy ranch and in connection with distribution, and the passage and enforcement of state and municipal laws limiting, defining, and regulating the milk business, the increasing costs arising from the observance of such laws gradually forced out of business many small distributors who found that their limited means did not warrant the expenditure of the money required to improve their plants so as to place them in the condition exacted by the law and demanded by the health authorities. These either sold their business and engaged in other lines of endeavor, or combined with others similarly situated, and by thus obtaining larger capital were able to continue.

"Better co-operation between producer and distributor is essential to make the business of producing and delivering milk as successful as its great importance demands. Recent figures show that the value of dairy cattle places the dairy industry of this state among the most important of all our industries. While it is true that much of the product is not consumed as fluid milk, the fact remains that fluid milk is the most important food known to man. The duty is cast upon both producer and distributor, therefore, to work in harmony to the end that by intelligent co-operation they may not only give their business the success which is its due, but may also confer a real benefit upon the people of the state by educating them to a realization of the fact that they have awaiting them at their very doors a natural food product which science may imitate but not replace, and which, from the standpoints both of health and economy, is alone in its own field."

THE E. P. RIFORD FARM IN VERMONT

The struggle against adversity which has been fought cheerfully and successfully on this farm is the basis for the editorial, "Pessimism vs. Thinking", on page 122 of this issue.

Los Angeles Milk Survey

At the evening session Dr. Everett C. Beach, Director of Physical Education of the Los Angeles School Department, described the recent milk survey of the children in the elementary grades of the Los Angeles schools. Fifty-two thousand five hundren children were questioned as to the amount of milk they consumed daily, their ages were recorded and heights and weights obtained. It was found that 16,720 or 32% of the children received a glass of milk daily, 12,504 or 23% consumed a pint or more, and 23,276, or 45 per cent, did not receive any milk regularly. The heights and weights of these children were compared on the basis of their

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Breeding Improved Timothy

Timothy is by far the most important American hay grass. The plant is extremely variable, as can be seen by close inspection of any field. It is evident that if the best of the varieties can be isolated there should be a considerable increase in yield obtained. Work on this problem has been conducted for some years, mainly at North Ridgeville, Ohio, in co-operation with the Ohio Experiment Station. The actual work of isolating and multiplying superior strains has proven much involved and time-consuming, as practically every good timothy plant is a heterozygote—that is, it does not breed true. However, by painstaking work a number have been secured which reproduce themselves from seed with considerable uniformity. Under plot tests their superior yielding capacity is marked. Of two of these strains seed has been grown in quantity and fields are now under test by many Ohio farmers. It is anticipated that their results will coincide with those obtained from plots and demonstrate the practical value of selected strains. Previous work has shown that improved timothy, like corn, has narrow adaptations; that is, each superior timothy retains its superiority only under conditions very similar to those under which it was selected. It is, therefore, likely that breeding will have to be done for each distinct region. The potential increases in yield will, if realized in practice, make the work of large financial importance.—C. V. PIPER, U. S. Department of Agriculture.

Want to wear your tractor out quickly? Stopped tubes that do not carry grease to the journal and loose cup covers are both excellent ways.

Keep the garden coming. A few crops may still be planted for fall use; spinach is one of them.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

Smilin' Jim

Smilin' Jim, that's smilin' Jim,
The world is mighty kind to him.
Or is it that he's kind himself,
And puts dull sorrow on th' shelf?
The weather may be good or bad,
But Jim is always smilin'—glad.
"It don't help none to worry, see!"
Is what he always says to me.

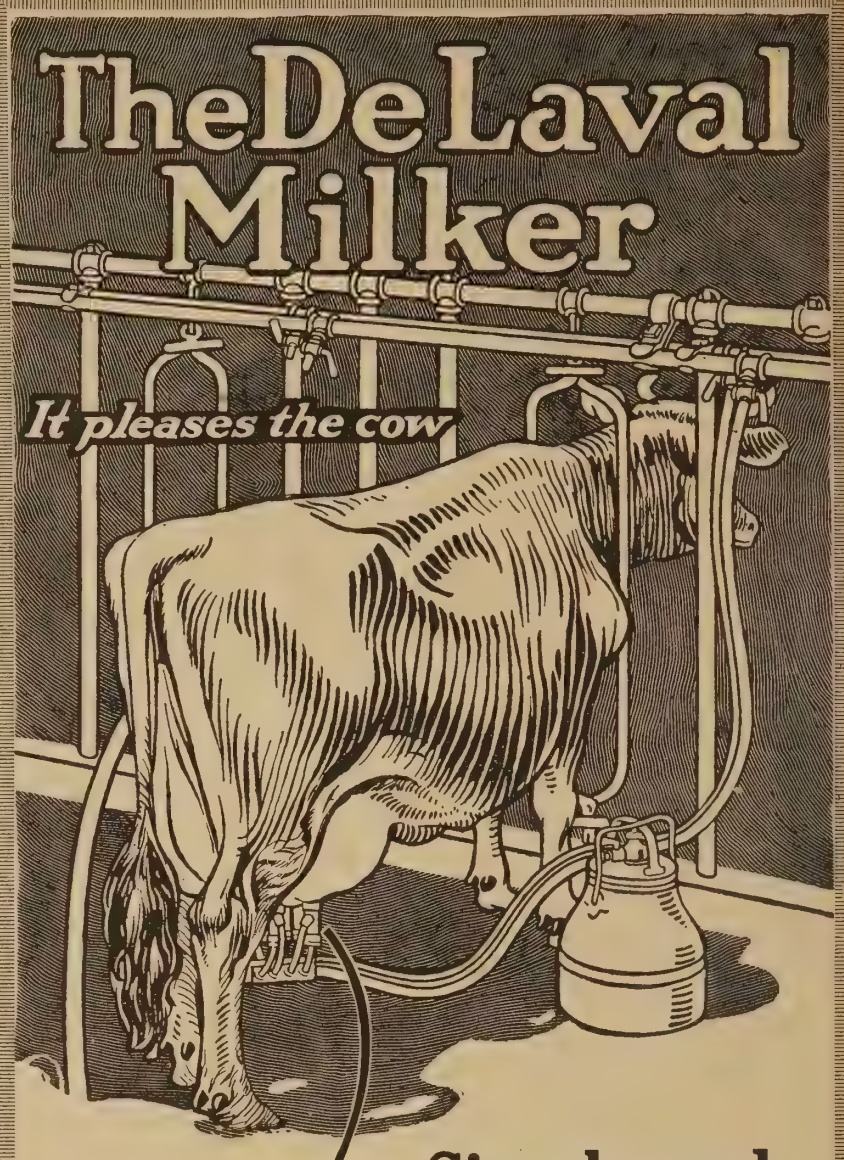
Smilin' Jim, dear smilin' Jim,
And when his pocket-book grows slim,
And crops are poor and cattle slick,
He always turns that smilin' trick.
Folks like to see him come their way
Because he grins th' livelong day.
Good natured people spread content,
And worryin' don't pay th' rent.

Smilin' Jim, our smilin' Jim,
And not until th' stars grow dim
And suns shall fade and moon go out,
Will Jim be filled with woe and doubt.
There's sunshine in his very soul,
And hope has always been his goal.
"God's good," he says, "it all comes right,
Why deal in darkness when there's light?

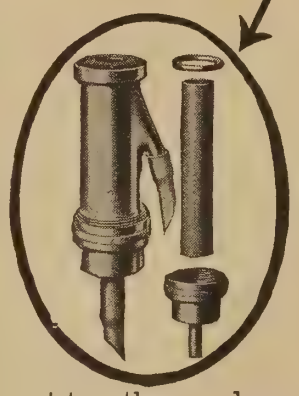
"How have you solved the labor problem?"

"Oh, I advertised in city papers for girls to work during the summer months, and said that powder puffs would be given away free, on application, and that every room was supplied with a mirror."

An Old Sweetheart of Mine



I can remember her
Just as plainly as though
It happened yesterday.
She lived on the farm adjoining ours,
And she was as fair as a flower,
With milky cheeks.
And light, fluffy hair,
And her lips were red—
The red of ripe cherries.
She wore sunbonnets
As if they were crowns of glory
And the summer time dresses
That her mother made for her
Were better than the tailored kind
Of the big city
And sweeter, by far.
And she sat next to me
At Sunday School,
And she blushed every time
I glanced in that direction
And I blushed, too.
And I thought, when I grew up
And had a herd of my own
And a silo,
And a nice new cream separator,
That we'd be married.
For she was the only girl
In the world.
But one day,
She stuck her wad of chewing gum
In the wrong place on the seat
And I sat on it,
And couldn't move,
And we quarreled,
And that was the end
Of a perfectly good rural romance.



Dairy Joe's Philosophy

When a man on a farm tells me he's too busy to read, I wonder if he's too busy to pray. Knowledge is as necessary as religion, because one engenders the other.

Chased a crowd of small boys out of my apple orchard yesterday. They think it's because I'm a stingy old duffer. But I did it because I knew how that stomachache would hurt if I left 'em there—I've been a boy myself.

Cows have mighty purty eyes. Ever looked at 'em much? Animals with eyes like that are sure to be almost human. And they ought to be treated that way.

Simple and Sanitary Teat-cups

The simplicity of construction of the De Laval teat-cups is plainly shown in the illustration. They are easily taken apart and put together, and very easy to clean and keep clean.

The rubber lining is simply a straight piece of rubber tubing. It is small enough to fit the smallest teat and is held in the metal casing, which is large enough to fit the largest teat. Hence the De Laval teat-cups are self-adjusting. They are made in only one size, which fits all teats.

The liner is made of pure rubber, scientifically correct in construction and design, producing a massaging action on the teat between suction periods.

A flexible rubber mouthpiece is formed by the top of the liner in such a way that no metal touches the teat.

The De Laval Milker is faster, more economical and more reliable than any other method of milking. The sanitary features are of special importance. It is quickly and easily cleaned, and is used by many dairies in A. R. O. work and where certified milk is produced.

An additional insurance of lasting satisfaction to users of De Laval Milkers lies in the De Laval Company's well-known facilities and reputation for service.

WEED SEEDS IN MANURE

A. L. STONE, WISCONSIN EXPERIMENT STATION

FOR several years the agricultural chemists have emphasized the desirability of hauling the manure directly from the barn to the field. Two important reasons are given for adopting this procedure. One is the economy of handling the manure but once instead of twice as is necessary when the manure is piled in the barnyard and must again be loaded into the wagon or manure spreader before it can be taken to the field. There is no doubt, whatever, that loading the manure directly into the wagon or spreader from the trenches and at once spreading it on the field is the most economical method of handling it.

The second reason which the chemist gives for his recommendation is that there is no leaching away of the fertility from the exposure to rains and washing such as occurs where the manure is left piled in the barnyard for two or more months. If the manure is spread over the fields in the winter as rapidly as it is made there will undoubtedly be some washing and leaching of fertility out of the manure during the winter and spring. In a majority of cases, however, this fertility will be washed directly into the soil on some portion of the field. If the field is fairly level the fertility will undoubtedly remain on the portion of the field where it was applied. On the other hand, if the field is on a hillside it is probable much of the fertility may be washed entirely off the field to which the manure is applied.

There is one fact in connection with this method of handling farm manures which many of the chemists do not seem to realize, or at least take into consideration. This is the very large number of weed seeds often contained in the manure. If all the feed fed to live stock were absolutely free from weed seeds, no harm could result from hauling the manure directly to the field. This condition is so rare, however, that it may be dismissed without further comment. Either in the concentrates or in the roughage, weed seeds are almost certain to be present, often in very large numbers. These weed seeds are not ground by the teeth of the animals because they are too small and are not easily destroyed by passage through the stomachs and intestines of animals. As a matter of fact, it has been shown that some weed seeds are in even better condition to germinate after passing through the alimentary tract. If then the manure containing such weed seeds is hauled to the field during the spring, summer, or fall they will be placed under the very best conditions for growth into splendid specimens of their kind. On the other hand, seeds of many weeds are not at all affected by the passage through the animal. If taken to the field, in manure, during winter the seeds would remain unharmed and be ready to take advantage of the fertile soil when spring arrived.

It may not have occurred to many that manures may be of any importance as a factor in the spread of noxious or troublesome weeds. In some barnyards it happens that weeds are allowed to flourish and produce seed on the manure heaps where the manure is allowed to remain in the yard during the summer and hauled to the field in the fall after harvest. It would be expected that under such conditions many weeds would grow from the seeds which fall upon the manure piles to be carted to and spread upon the field.

There would seem to be no other way in which weed seeds could get into the manure. A little thought will convince anyone that it is impossible to feed forage or concentrates containing weed seeds without some of them reaching the manure through the bedding and any uneaten feeds thrown into the manure trenches or out in the barnyard. This is sure to be true if in the hay there are ripe weeds of Canada thistles, rose bushes, Russian thistles, or other weeds which are so spiny or thorny that live stock leave them untouched.

OX-EYE DAISIES IN A MEADOW

If the hay is cut and fed to live stock the seeds are almost certain to get into the manure and be carried to other fields.

A SAMPLE OF OATS INFESTED WITH (1) QUACK GRASS, (2) CORN COCKLE, (3) WILD OATS, (4) WILD BUCKWHEAT, (5) CHESS OR CHEAT

Feeding such oats can only result in infesting fields with these weeds, the seeds of which are certain to get into the manure and thus be carried to the fields.

WILD OATS ADJOINING A HAY FIELD

The wild oats ripen at the top of the head early and at the base of the head late. Some of the oats would ripen in the hay and if fed to live stock would certainly get into the manure.

It will greatly surprise many farmers to learn that the concentrates which they buy in the form of oil meal, bran, and mixed dairy feeds, contain large quantities of weed seeds.

In the milling of wheat and other grains immense quantities of weed seeds are cleaned out of the grain before it can be made up into manufactured products. Much of this material which goes under the name of "screenings" contains a fairly high percentage of seeds which have a great deal of feeding value. Unless the screenings contain seeds which are bitter, acrid, or otherwise disagreeable in flavor or odor they may be ground up with varying quantities of grain making a feed easily meeting the standards for protein, carbohydrates, and ash required to make the feed salable. Sometimes these weed seeds are found in feeds where the farmer least expects to find them. A farmer who had purchased some oil meal noticed some dark specks in it and sent a sample to the experiment station for examination. Much to the amazement of all concerned the feed was found to contain approximately 128,484,000 unground weed seeds to the ton. Included were the seeds of such noxious weeds as Canada thistle, Russian thistle, wild mustard, Indian mustard, and wild oats. The unground weed seeds constituted 10 per cent, by weight, of the feed. A lot of bran for which a big price had been paid was found to contain 108,256,900 weed seeds to the ton. Altogether there were 32 different kinds of weed seeds in the bran, among them being wild oats, wild mustard, Russian thistle, Canada thistle, and yellow dock, all noxious weeds. Another farmer sent in a sample of unground screenings which a neighbor was feeding to sheep. He feared the weeds would begin growing on the neighbor's farm and the seeds be washed or blown over to his own. There were approximately 870,188,000 weed seeds in a ton of the screenings and they constituted 55.52 per cent, by weight, of the entire bulk of feed. Grains of various kinds made up 1.9 per cent and the remaining 42.58 per cent was broken seeds, dirt, sand, chaff, etc. While it is a well known fact that sheep masticate their food thoroughly many of the seeds are so small they will be swallowed without being crushed and will later be found in the manure. Not only this but many of the seeds are certain to get into the bedding, or if fed out of doors will fall to the ground and produce plants, the seeds of which may be easily carried to adjoining farms.

Another type of feed which often contains large numbers of weed seeds is the chick feed of various kinds offered on the market. Two lots of chick feed were recently examined, one of which contained approximately 20,660,800 and the other approximately 313,346,380 weed seeds to the ton. Any seeds eaten by the poultry would undoubtedly be destroyed but again there is danger of the seeds reaching the manure and later the fields.

It seems then that it is hardly safe to haul manure directly to the field unless great care is taken to see that there are no weed seeds in the feeds supplied to the farm animals.

Suppose it is necessary to use such feed, can anything be done to prevent danger of infesting the fields with weeds? The answer is, yes. The method lies in piling the manure in piles eight or more feet in depth and leaving it there for sixty days. The fermentation of the manure generates enough heat to destroy the vitality of the moistened and softened seeds. Whenever possible the manure should be stored in concrete pits, or at least be protected by a covering of some kind from rains and washing or leaching away of its fertilizing value. It is possible also that at the time the manure is to be hauled to the field, the surface foot of manure should be taken off and repiled for a time. While this may not be necessary it will avoid any possible chance of carrying weed seeds to the field in the manure.

The weed problem has become so serious that no precaution should be neglected but every source of new introduction guarded against with extreme care. Only as this is done can our farms be made to produce maximum crops.

(Comment on the statements in this article appears on the editorial page of this issue.—Editors.)

DAIRY PROGRESS IN IDAHO

J. F. BRUINS, IDAHO

THE bedfellowship of the lion and lamb had nothing on a spectacle which Boise Valley dairying recently presented. Jersey and Holstein men, united in fraternal amity, went out to Oregon together to buy four carloads of pure-bred stock.

The project was engineered by the farm bureaus of Ada, Canyon, and Gem Counties. It began as a calf club plan but several dairymen took occasion to buy pure-bred stock and increased the size of the shipment. Forty-eight head of Jerseys were bought and 28 of Holsteins.

The plan of selling the stock at an auction open only to those ordering the stock was adopted as it was felt that this would avoid the dissatisfaction often felt at having to take what was ordered without personal inspection. It had the additional advantage of placing an initial value on the stock and of exercising the wits of the bidders. Those who applied for stock signed notes which guaranteed any deficit and any excess was prorated. As a matter of fact, at the sale of Jerseys the surplus amounted to about 30% over the cost price and in the case of the Holsteins, 20%.

As evidence of the local standing of dairying these deals are examples. The banks advanced some $8,000 for the shipment of Jerseys, taking notes of dairymen or in the case of the boys taking the parents' notes. There does not seem to have been any hesitation in accepting the note of any person for this purpose.

The stock sold amazingly well. Thirteen Jersey cows which cost an average of $280 sold for an average of $440, the top price being $800. The calves sold at $120 to $400 for yearlings. These prices were of course subject to discount to actual cost of the stock, but there is little question but what at public auction the stock would have brought as much or more.

The average for the Holstein sale was $310, or about the same as for the Jerseys. The top price was $650 for two cows, this amount being bid for each. The Holsteins were of good breeding but handicapped by being in less favorable condition than the Jerseys. Buyers for both breeds reported stock was very difficult to obtain and breeders were willing to part with it only on account of the great difficulty in securing and holding help and the very high prices for feed prevailing.

A Calf Club Sire

The Boise Valley Jersey breeders have undertaken a "stunt" which is without precedent so far as known. When the members for the calf club were being secured the question of service for these calves was brought up. Few local breeders will allow the use of their sires to the public so the club took the matter in hand. It was decided that the club would buy the bull for this purpose and at the same time use him for the general improvement of local stock.

La Creole's Oxford Dolly Boy was purchased of Mr. W. O. Morrow. He is a proven sire whose daughters have already sold for sums running well into four figures. One grandsire was Oxford You'll Do, and the other Golden Glow's Chief, both gold medal bulls. His dam has a record of over 700 lbs. fat. The service to this bull will be free to Jersey calf club members and he will be used also by owners of pure-breds for a fee which it is hoped will eventually retire his purchase price. In order to keep him he was placed at the farm of the Boise high school. Several local Jersey breeders have promised to donate a pure-bred heifer apiece to start a herd at this farm.

Other Idaho Sale Importations

The sales mentioned are not the only instances of recent importations of pure-breds into Idaho. Most of the females of the famous Stump herd were brought into the Payette Valley by a dairy purchasing association and there publicly auctioned off. The top price was $1,000 for the heifer, Bonnie Rochette, and others fell not far short of it. Stockwell's Dahlia brought $600. She has a record of 743 lbs. as a 10-year-old and but for her age would have brought much more. The 43 animals in this sale sold for an average of $336. The surplus over purchase price in this case will be used to finance the purchase of additional stock for the Payette Valley.

The Twin Falls County has also purchased a shipment of well bred Jerseys. In this case the calf club became a cow club and the boys bought cows at $250 to $450 each. The idea is that they will largely pay for themselves before the notes come due.

Dairy extension specialists would be glad to know the source of the report that western breeders were about to import a shipload of Guernseys. There is room for them and they would be welcome but the story seems to have no foundation in fact.

Idaho dairying has had its hard sledding. The last summer was a period of prolonged drought and shortage of irrigation water so the feed crop was cut very short. On top of that, winter came a month early and was unusually severe and the spring was late and cold with backward pasture. It has, however, strikingly shown the essential soundness of dairying. The range beef and sheep business is simply demoralized. Even hogs are getting scarce. In the face of unheard of prices for feed good dairy cows are selling higher than ever and are rarely found on the market. Dairying has been steadily gaining in this section for years and a crisis in the live stock industry merely emphasizes its fitness to survive.

Manufacturing and Marketing Problems

Marketing problems have not generally given us great concern during the period of rising prices but the recent slump has brought this question again to the fore. The local market is divided between a condensery, a co-operative cheese company, and various commercial creamery establishments. The co-operative operates six cheese factories besides a creamery and retail business in Boise. The slump in cheese prices the past winter caused them grave difficulty and for a time they skimmed their milk and made butter and casein. The company seems to feel keenly the competition of the condensery.

The present plan is to build a powdered milk plant. It is said to require $50,000 to $60,000 and as the company has close to 600 stockholders this will require $100 apiece. The plans are not yet fully matured. A chief difficulty is the heavy royalty, 5% of the gross sales, demanded by the Merrill—Soule Company. The local concern does a business of about half a million dollars a year and at this rate would have to pay $25,000 a year to this concern in royalties alone for this one valley.

Prices for butterfat in this region have gone down as elsewhere but as there is little product marketed as city milk the difference is not so striking and there is no surplus milk problem. Creameries have been paying 55 to 60 cents for fat in some creameries and the condensery 65 to 70 cents for fat. The cheese factories have paid as low as 55 cents for whole milk but have consequently lost patronage heavily to the condensery.

Feed prices have ruled high, $3 to $3.75 per cwt. for whole grains and $6 for linseed with mill feed scarce at $2.40. Alfalfa hay has sold most of the winter at around $20 but is now practically unobtainable. The high feed prices have greatly stimulated interest in silage and owners of even small herds are planting a few acres of corn this year.

One unusual feature of the feed situation this year was the importation through the Ada County Farm Bureau of a carload of cane molasses. It cost $2.45 per cwt. barreled, laid down here. Dairymen have been much pleased with the results of feeding it and are talking of bringing it in in a tank car and storing it in tanks formerly used for fruit spray.

Interest in testing has been making considerable progress. There are now four associations in the state doing testing with three more in prospect. Interest in official testing has increased greatly also. Jerseys lead at present with 10 herds and about 70 cows on test followed by Holsteins and Guernseys. Many new records for the state are promised this year.

Land Booms and Reactions

Idaho has experienced a land boom as well as other sections. Land has changed hands so rapidly that any one who has been on his present place more than three years is apt to consider himself an early settler and entitled to tell how deep the snow was back in the winter of 1917. Some farms have changed hands at as high as $500 per acre, but the general land price in this valley seems to have advanced from about $150 to $250 an acre in the past two years. The results seem to have been to unsettle crop production, break up rural communities, raise taxes, and enrich the real estate dealers. Any section having these objects in view should encourage a boom.

It is much to be regretted that the dairy industry has been used as a large part of the excuse for the recent land boom. It is no trick at all for a realty dealer to raise 20 tons silage, 5 to 8 tons alfalfa, or pasture 3 to 5 cows for the summer on an acre of land. Fortunately their stern sense of public duty keeps these gentlemen from engaging in this lucrative occupation. Dairying in Idaho is nevertheless making remarkable and real progress with ordinary sanity, and by depending on cows instead of conversation it should continue.

Texas News

The Dairymen's Co-operative Association has been incorporated at Paris, Texas, with a capital stock of $10,000. The incorporators are R. F. Scott, Jr., W. M. House, and M. C. Gullege, all of Paris.

The Yoakum Dairy Club has been organized at Yoakum, Texas. Louis Poth is president; M. S. Hagan, vice-president; and J. J. Kutack, secretary.

The Addicks Dairy Farmers' Co-operative Society has been incorporated at Addicks, Texas. It has no capital stock. The incorporators are L. Koch, C. Kobs, and G. Groschna, all of Addicks.

The Pearland Dairy Farmers' Co-operative Society has been incorporated at Pearland, Texas; no capital stock. Incorporators: J. A. Geyer, R. W. Higgins, and Joe Bennes, all of Pearland. W. D. HORNADAY.

DAIRYING IN IDAHO—AS IT WAS

DAIRYING IN IDAHO—AS IT IS—IN SPOTS

Wisconsin Jersey Record Broken

R. S. HULCE, Wisconsin College of Agriculture

A NEW record recently completed at the University of Wisconsin puts University Kenna Climax No. 306657, as a producer of butterfat, at the head of the mature class of Jersey cows in Wisconsin. Her yearly record of 15,849.8 pounds of milk and 746.76 pounds of butterfat displaces that of Croatia of St. Lambert with a record of 705.29 pounds of fat. The university cow carried a calf seven months of her test, which puts her well in Class "AA", since 155 days in calf before completing the test would have qualified her for that honor.

Her production by months is shown in the accompanying table.

University Kenna Climax was bred at the University of Wisconsin. Her sire was King Sappho King, formerly at the head of the well known herd of J. Q. Emery & Son of Wisconsin. Her dam, King's Miss Kenna, was one of the best cows ever owned at the university. She made as a junior three-year-old a semi-official record of 11,490 pounds of milk, containing 543 pounds of fat, and later made a stable record which surpassed it.

1918	Lbs. milk	% fat	Lbs. fat
December 29—31	108.4	4.98	5.40
1919			
January	1,597.1	4.95	79.06
February	1,630.0	4.24	69.11
March	1,769.2	4.02	71.12
April	1,640.2	4.27	70.04
May	1,478.8	4.65	68.76
June	1,204.8	4.71	56.75
July	1,180.6	4.96	58.56
August	1,182.1	4.51	53.31
September	1,128.2	4.94	55.73
October	1,091.3	5.67	61.88
November	986.1	5.30	52.26
December 1—28	853.0	5.25	44.78
Total	15,849.8		746.76

The accompanying illustration of the university cow was taken after her last freshening and shows her in a thin condition, due to the very short time she went dry. She is an excellent example of a hard working machine for her ability to consume feed is equalled by few cows of her size and her tendency to convert feed into milk and butterfat is well illustrated in the photograph.

Her last calf is a fine heifer sired by Pogis 99th of Hood Farm 21st.

UNIVERSITY KENNA CLIMAX, JERSEY RECORD COW OF WISCONSIN
Year's record, class AA; Milk, 15,849.8 lbs.; fat, 746.76 lbs.
OWNED BY UNIVERSITY OF WISCONSIN

A CO-OPERATIVE MILK DELIVERY PLANT

ELLSWORTH BROWN, PENNSYLVANIA

PREVIOUS to the spring of 1918 there were ten farmers in the dairy business who made a specialty of delivering milk and cream to private customers in our little city of Greenville, Pennsylvania. As each wagon was driven on nearly every street in town and but a few quarts sold on each street, there was much duplication and the waste of time and effort became more and more apparent each season. Those dairymen who had to hire drivers to do the delivering, experienced additional difficulty in retaining competent men for this work, as each man must make the trips every day—Sundays, holidays, rainy days, and cold days. The result was frequent strikes, and the drivers, without the customary 20 days or even 20 minutes' notice, would slip quietly away and the double work of milking, delivering the milk, and washing the milk utensils fell upon the dairyman, and any amount of cussing was useless.

As the war clouds grew thicker and hired help became an unknown quantity, the prospects for a milk famine in town began to assume shape. The Board of Health finally took up the matter with the milk men. A meeting of this body was held with the milk men to discuss the situation. A co-operative association was suggested and plans for carrying out this movement began to be made. A committee was appointed to visit a plant where co-operative dairying was successful. This committee reported favorably and a corporation with a capitalization of $9,000 was formed. Here is where we made our first mistake. It soon became apparent that a $20,000 capitalized corporation would be needed. A petition was presented to the state government for the increase. The increase was granted, but it cost us $60 in fees. As soon as our charter was granted we proceeded to organize. Our county agent was elected one of the three auditors.

TWENTY-THOUSAND DOLLAR FARMER-OWNED MILK PLANT

Our next difficulty was to secure a suitable building in which to operate our business. We finally applied to the Board of Trade and they helped us to secure a two-story, brick building 30x 120 feet and we began to plan for installing machinery. The next difficulty was in getting the railroad to transport the machinery to us from the factory. After long waiting it finally arrived and all the dairymen turned out and helped to move it from the station to the plant.

Considerable changing in the building had to be done before the machinery could be installed and this was done largely by the dairymen.

Finally the start in the new system of delivering was made. Instead of ten wagons to do the delivering, four wagons and four drivers were employed. These four drivers did the same work that the ten persons formerly performed. Each driver makes two trips each forenoon and covers one-fourth of the town in the two trips. There is no duplication in routes.

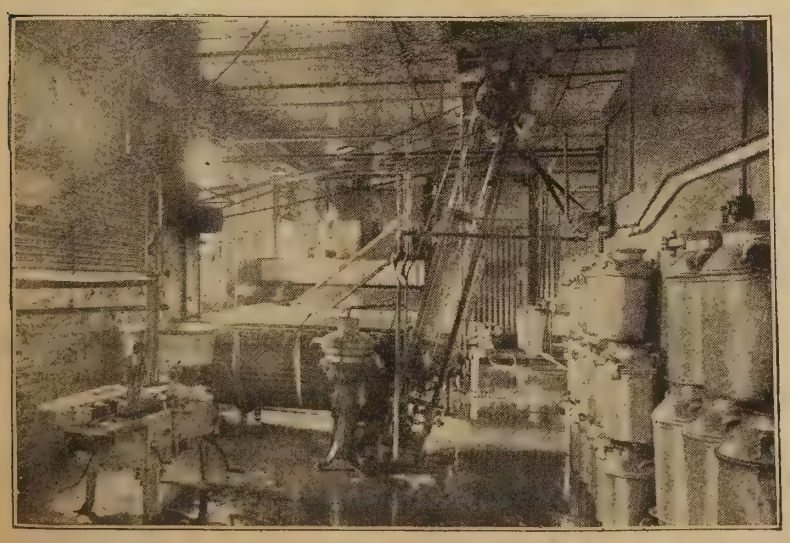
The milk is pasteurized and the citizens who had been buying raw milk were treated to the pasteurized product. Many who had never tasted the new process milk—and there were many of the citizens who had never heard of pasteurized milk—began to complain that there was something wrong with the milk.

Any radical change from the regular routine of a system which has been followed for years is sure to meet with a storm of protest. So the dairy association's new methods of handling the milk and selling "cooked stuff" met with condemnation from nearly every patron. Some said the milk was not clean, others proclaimed it tainted, still others were positive it had been watered, and a few wise ones were sure that dope had been added. The many telephone messages that were sent in to the manager and officers of the association from irate customers kept up the interest intensively.

But now after two years' use of pasteurized milk and cream, nearly all of the patrons are well satisfied and do not want to return to the use of milk in its raw state.

The advantages to the dairymen in the formation of their association is apparent. The farmer can select his own time to deliver this milk to the milk plant up to ten o'clock each morning. After unloading his milk or cream at the factory he can hurry home. The tiresome job of washing one or two hundred bottles each day is eliminated. Duplication of routes is "cut out". His pay is sure to come each month.

The method of distributing the payment for the milk is simple. The expense for hired help, overhead charges, etc., are deducted from the receipts. The balance goes to the producers, pro rata, on a butterfat basis or 3.5% milk, with five cents added or deducted for each one-tenth point above or below the 3.5% basis.



Each driver before he starts on his trip is charged up with the amount of his load and credit given him for surplus which he brings back. It was the original intention to deduct all losses in the collection of bills for products sold from the monthly salaries of the drivers, but this provision could not be carried out.

Besides milk and cream the association manufactures ice cream and buttermilk and other dairy products. Large quantities of cottage cheese are manufactured and packed in neat cartons holding nearly a pound each. These are sold to the grocery men throughout the town. A good deal is also shipped to other towns in tubs.

The success of our corporation was made possible through the help of the citizens of our town who bought stock in the enterprise and assisted us in many ways.

The work of pasteurizing, bottling, and delivering the milk and other products of the creamery, also keeping the books, etc., requires about a dozen

(Continued on page 119)

THE INTERIOR OF THE MILK PLANT AT GREENVILLE, PENNSYLVANIA

Showing Dairy Cattle

R. S. HULCE, Wisconsin College of Agriculture

THE stockman who is planning to exhibit live stock during the rapidly approaching show season should already have made his selections. To exhibit animals with rough coats and in a very thin condition is not fair to either the stock or the exhibitor when one considers the reason for showing.

There are several reasons why owners of good live stock should exhibit. A first class representation of any breed is an important element in the promotion of breed interests. Many a man considering the choice of a breed has been influenced in his choice by the character of the breed exhibits he has seen. Beginners who have already started the breeding of live stock are encouraged, and obtain much information at live stock shows. Breed and agricultural associations have long realized these facts and consequently prize money is offered to stimulate the realization of the ends in view.

There are advantages that come to the individual exhibitor in the way of advertising his own animals. The writer was at one time located in a community where the sale of pure-bred dairy cattle was rather slow. It was therefore decided to try out the advertising effects of exhibiting at fairs. The results briefly were that enough prize money was won to practically pay expenses and the inquiries for stock and sales later made more than justified the adventure from every standpoint.

The element of competition does and should enter in very strongly. We like to know whether or not an animal we own is better individually than the one exhibited by some one else. If we win, the satisfaction would in many cases be sufficient without prize money. The placings, if not made according to our ideas, may or may not change our prejudices, but we must learn to be good losers as well as good winners. A prominent breeder and exhibitor of swine makes the statement that he learned more about swine the week that he exhibited at a neighboring state fair, where he lost heavily, than he had ever learned about swine previously.

Dairy animals to be selected for fitting should be good sized for their age, possess straight top lines, good middles, prominent back bones and clean-cut features in general. In females udder development, including size, shape, quality, and well placed teats are important. Animals about to freshen show to an advantage.

A good fitting ration might consist of equal parts by weight of wheat bran, ground oats, ground corn, and oil meal. If the animal is very thin, add more corn or barley. Bran and oats tend to lighten the ration and give variety, while oil meal helps to put on a sleek coat. Good clover or alfalfa hay and corn silage are important. The silage, however, should be discontinued some time before the animals leave home, so that they will be receiving the same feeds that are to be fed while at the fair.

Clip each animal all over and blanket it several weeks before the date for showing. If clippers are not available, work out the old hair by brushing the body with sand paper tacked to a block for convenience in handling.

The purposes of blanketing are:

1. Keep the animal clean.
2. Sweat the hide and better its handling qualities.
3. Help shed old hair and make the rest straight.

To aid in putting the skin and hair in condition, wash several times a week with soap and water. When the hair has dried, apply cottonseed or olive oil and rub with a woolen rag. This not only improves the quality of the skin, but adds a gloss to the hair and gives the body a very clean appearance. For grooming, a soft brush is advisable. Avoid the use of a curry comb except for the purpose of removing dirt that clings tightly.

The horns must receive attention. Scrape down the rough portions by the use of a file or the edge of a broken piece of glass. Be careful not to make the skin sore at the base of the horns. When the horns have been worked down nicely, rub them with emery cloth to put on a smooth surface. For polishing, fix up a paste, using sweet oil, powdered pumice stone, and add a little shellac. Apply this paste mixture to the horn and rub with a woolen cloth. If the horns have been put in good condition before leaving home, polishing will be all that is necessary at the fair. The hoofs may be trimmed by use of pinchers followed by a rasp.

It is necessary to do some clipping just previous to showing. This will include the tail above the switch and usually the ears and portions of the head or face. In case of cows, the udder should be clipped just previous to showing.

A point often overlooked is that of breaking the animal to lead and to stand properly. If the efforts of the attendant are taken up in dragging and pushing an entry about, many of the good points which the animal might otherwise show are concealed. An exhibitor should have just one thought in mind while showing in the ring, and that is to give his entry every possible chance to show at an advantage. By this is meant that his animal stands squarely on its feet, back straight and head alert. Any movement either on the part of the attendant or animal should be as graceful as possible. A good animal poorly shown does not always get its just dues.

Two or more breeders who feel that each individually does not have a sufficient number of animals that they wish to enter may well go together and put on a combination exhibit. This plan, carried out on a more comprehensive scale, may be made an excellent advertisement for a community or county association.

LADY AAGGIE ECHO HENGERVELD

I AM pleased to be able to report that the Holstein-Friesian cow, Lady Aaggie Echo Hengerveld 323463, has broken the record for fat production in the senior three-year class of the semi-official yearly division, by producing in 365 consecutive days, 28,008 lbs. milk containing 960.56 lbs. fat. She freshened at the age of 3 years, 7 months, 13 days. Her best seven days' official production, made in the early part of the lactation period, is 684 lbs. milk containing 25.49 lbs. fat, while in thirty days she produced 2,894.2 lbs. milk containing 97.268 lbs. fat. During an official test, beginning 255 days from freshening, she produced in the division covering tests begun not less than 240 days from freshening, 494.4 lbs. milk containing 19.753 lbs. fat. Her sire is Paul Aaggie Oakhurst 55387; her dam is Lady Echo Hengerveld De Kol 2d 159461. She was bred by Mr. Albert E. Smith, Washington; and she is now owned by the Toyon Farm Association, cent basis, the equivalent butter claimed for Lady Aaggie Echo Hen- California. In the senior three-year class of the yearly division she displaces Jewel Pontiac Segis 229261, whose record for 365 days is 27,068.5 lbs. milk containing 936.92 lbs. fat. Computed on the 80 per gerveld amounts to 1,200.7 lbs.—MALCOLM H. GARDNER, Supt. A. R.

Maxims posted on the walls of his bank by the elder Rothschild:

Dare to go forward.
Never be discouraged.
Never tell business lies.
Be polite to everybody.
Employ your time well.
Be prompt in everything.
Pay your debts promptly.
Bear all trouble patiently.
Do not reckon upon chance.
Maintain your integrity as a sacred thing.

If you can't spray, then whisk! An old brush-broom will spread the spray materials on the insect and disease infected plants of your backyard garden.

Association Notes

Edgar—Marathon, Wisconsin:—One cow sold for beef. Association has ordered a carload of oil meal for August delivery. June milk testing 3.5 per cent sold for $1.96 per 100 lbs. The creamery paid $.59 for fat and the cheese factory $.52 to $.60.

Monadnock, New Hampshire:—Twenty-six cows were tested for semi-official records. Ten separators were tested for cleanliness in skimming. Three profitable and two unprofitable cows were sold and one pure-bred Guernsey sire was purchased. For the last two years every herd in this association has had a pure-bred sire at its head. Bran sold for $68 per ton; gluten, $82; cottonseed meal, $83; oil meal, $77; ground oats, $95; corn meal, $85; bran middlings, $72; hay, $50; Schumacher feed, $76; Larro, $84.

Lake County No. 2, Illinois:—Owing to the extreme hot and dry weather during July, most of the herds in this association dropped considerably in production and had to be fed winter rations. Two members have purchased milking machines. One member purchased two pure-bred Holsteins, very choice individual daughters of King Lyons and Prince Hengerveld Pietje. Market milk sold for $3.20 per hundred. Unicorn cost $82 per ton; bran, $56; Big Q, $80; oil meal, $78; cottonseed meal, $80; silage, $8; pasture, $2.00 per cow per month; oats, $1.00 per bushel.

Richland County—Sabin, Wisconsin:—One pure-bred bull was bought. One set of drinking cups was installed and 7 unprofitable cows sold for beef. Several members have started their cows on grain rations which have not been fed for the past two months. One barn was remodeled and one new barn was built. Market milk sold for $2.60 per hundred pounds. The condensery paid 80c per pound for fat; the creamery, 62c and the cheese factory, 59c. Milk retailed for 12c per quart; butter, 56c per pound and cheese for 24c per pound. Oil meal cost $90 per ton; bran, $53; oats, $67; corn, $58; gluten, $82; Schumacher feed, $62.50; alfalfa hay, $80; barley, $69; cottonseed meal, $89.

Meadville, Pennsylvania:—Market milk sold for $2.90 per hundred pounds. Milk retailed at 14c per quart and butter 65c per pound. Oil meal cost $78 per ton; corn meal, $85; cottonseed meal, $78; gluten, $80; Unicorn, $84.

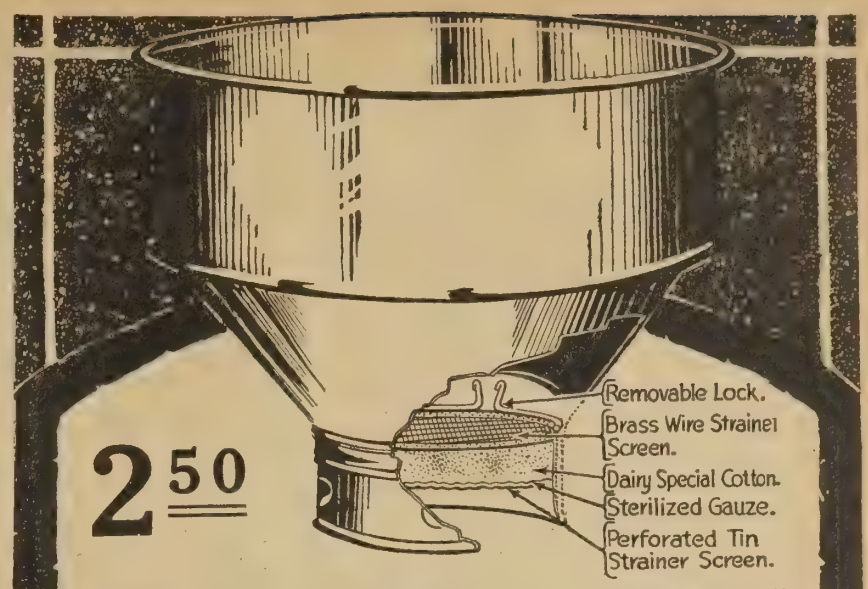
Orleans, Indiana:—A few cows are being sold as unprofitable. Sometimes they are kept at a profit after being tested and correctly fed. Market milk sold for $3.60 per hundred pounds.

Lake County No. 5, Illinois:—Market milk sold for $3.20 per hundred pounds. Bran cost $4.85 per cwt.; corn, $3.60; oats, $3.90; barley, $3.60; hominy, $3.40; oil meal, $4.25; cottonseed meal, $4.25; alfalfa hay, $40 per ton; clover hay, $35.

Pioneer, Minnesota:—Market milk sold for $4.50 per cwt. The creamery paid 70 cents per pound for fat. Milk retailed for 13c per quart and butter 64 cents per pound.

Coos, New Hampshire:—Market milk sold for $2.85 per cwt. Bran cost $68 per ton; corn meal, $84; hominy, $80; gluten, $80; cottonseed meal, $80; linseed, $80.

Vermilion—Champaign, Illinois:—Twelve unprofitable cows were sold. A carload of feed was ordered. Market milk sold for $3.60 per cwt. Milk retailed for 17c a quart.



To Manufacture Feed

HOARD'S DAIRYMAN:—Stockholders of a proposed flour and grist mill company at Porterfield, Marinette County, Wisconsin, met July 31, for the purpose of completing the organization of a $20,000 company. At a preliminary meeting at Harmony Corners in the same county, July 24, reports showed that $19,000 of the capital had been subscribed and confidence was expressed that $1,000 more would be taken before the coming meeting.

The purpose of this mill is largely to manufacture dairy cattle feed, flour being a secondary consideration. These farmers, who are specializing on dairying, as are most of the farmers of Marinette County, found last winter that commercial feeds constituted a serious burden and they have decided they can with advantage manufacture their own feeds of this class.

At the same meeting of July 24, the Marinette County Cow Testing Association was organized with Ed. Race, D. C. Taylor, Alton Francour, Carl Hart, Ed. Seiles, John Thompson, and B. F. Miller as directors. The association, which began testing August 1, has 59 members owning 725 cows.

Wisconsin. LEO P. COOK.

2.50

FILTER YOUR MILK

CP CHAPMAN STRAINER AND FILTER

A combined strainer and filter for the price of strainer only. To use the Chapman as filter, insert a layer of cotton and sheet of gauze between the two screens.

The filter will remove bacteria, dandruff, hair, blood corpuscles, straw and other substances that a strainer only can't catch. Thus will greatly improve the quality and flavor of the milk and prevent it from souring quickly.

Can be quickly taken apart for cleaning.

Consists of heavily tinned charcoal steel bowl, ring lock, fine mesh brass screen and perforated tin screen. Cotton and gauze furnished at extra prices below.

Strainer and Filter Complete $2.50

Postage extra, 30c

Wgt. 2 lbs. Size 12" in diameter.

Save Time and Labor Get Better Results

Success in breeding cattle, in the production of milk, or in raising chickens or other farm animals depends so much on healthful living quarters that no farmer can afford to neglect sanitation even when labor is hard to get. But there is no need to spend as much time and labor as the mixing and application, first of whitewash and then of disinfectants, call for. Not only the most troublesome part of the work of mixing and applying whitewash, but all the extra work of applying a disinfectant over whitewash can be saved by using

CARBOLA
The Disinfecting White Paint

which kills lice, mites, fly eggs, etc., and prevents the germs of contagious disease from getting a start in flock or herd. Carbola is a white paint in powder form. And right in the paint is a germicide many times stronger than pure carbolic acid, but neither caustic nor poisonous—harmless to the smallest chick or to stock that licks a painted surface.

Makes It Easier To Do Work That Must Be Done

Carbola is turned into smooth-spreading, liquid paint simply by mixing with water. No waiting, straining or bother—takes less than five minutes' time. May be mixed today and applied whenever convenient—does not spoil by standing. Put it on with a brush or spray pump to wood, brick, stone or cement, or over whitewash. It dries snow-white, and one gallon—one pound of powder—will cover 200 square feet. It will not clog the sprayer, nor flake or fall off as whitewash does, and the germicide, strong from the first, grows stronger as the paint dries, and is there day and night guarding your herd and flock against disease.

Use Carbola Instead of Whitewash and Disinfectants

in stables, kennels, poultry houses, rabbit hutches, cellars, hog pens, creameries, outbuildings, garages, factories, warehouses and on tree trunks.

Carbola will save you time, labor and trouble, and give you better results than you possibly can get from whitewash and disinfectants. The dry powder is excellent as a lice powder. Carbola is used by leading poultry, dairy and stock farms, and by U. S. Experiment Stations and Agricultural Colleges.

Your hardware, paint, drug or seed dealer has Carbola or can get it. If not, order direct. Prompt shipment by parcel post or express.

10 lbs. (10 gals.) $1.25 and postage **20 lbs. (20 gals.) $2.50 delivered**
50 lbs. (50 gals.) $5.00 delivered

NU-WAY

Sanitary Milker

No Other Milker Has This Sanitary Feature

THE exclusive sanitary advantage of the Nu-Way is the easily detachable pulsator, which can be entirely removed from the lid.

All parts coming in contact with the milk can be placed in the sterilizing solution without detaching a single tube. This explains the increasing demand for the Nu-Way Milker, because it keeps milk in the can as clean as it is in the cow.

The Nu-Way is also the only alternate action machine with milk flow visible in every cup. The Nu-Way Teat Cup has an indestructible sanitary glass bottom keeping the milk from each quarter in plain sight.

The Nu-Way will cut your milking time two-thirds, increase your profits and increase your reputation for clean milk, which means that you will always secure the highest market price for your milk.

Write for a booklet today containing full description of this wonderful milker.

Nu-Way Milker Company, Inc. 103 Decker St., Syracuse, New York

Cost of Making Cheese and the Future of the Dairy Industry

The cost of making cheese is a problem of grave importance to the future of the cheese industry and is attracting the attention of those who really have the best interests of the work at heart. A condition exists that has today grown to such proportions as to directly menace the welfare of those engaged in the business of manufacturing and marketing cheese.

For years there was a steady increase in the cost of the necessary buildings, equipment, and supplies for the manufacture of cheese. However, we were not greatly concerned in the matter until coming of war conditions when prices of all kinds of supplies began to mount rapidly. The price paid for making was increased, but in too many instances it has not been in proportion to the cost of manufacture.

Many of our best makers, attracted by better money making possibilities, have gone out of the business, leaving the way open to younger and less experienced men. In their enthusiasm and inexperience many of these younger men eagerly bought out the establishments of the older men and in many instances found that in face of the overhead expense and ever increasing cost of supplies the profits were often conspicuous by their absence. Many of the "old reliables" who have remained in the business have been confronted by this same problem and the profits of the business have not been such as to always provide for the necessary up-keep of buildings and replacement of worn-out equipment.

As could naturally be expected conditions of this kind have resulted in discouraged and dissatisfied makers and a general lack of interest in their work. The tendency has been to follow the line of least resistance, a policy that is today working greatly to the injury of Wisconsin cheese.

To get results the dairy farmer must realize that he should allow a price for making consistent with the cost of manufacture. This price must be sufficient to allow the manufacturer a decent living and a fair profit, a profit that will be some incentive for a good man to stay in the business and to give the best service possible. In return for a fair allowance to the manufacturer the farmer has the right to demand a class of work that will insure the best possible results. In too many instances the patrons of factories are so insistent upon better returns for their milk that the maker is compelled to increase his yield by methods that mean injury to quality, and injury to quality, consistently and generally followed, must eventually ruin the reputation of Wisconsin cheese and bring an incalculable loss in which everyone engaged in the cheese industry must share. This question of sufficient remuneration to keep good cheesemakers in the business is one of vital importance to the patrons of cheese factories and one that they should give their most careful consideration.

In many instances makers are receiving satisfactory prices but many others are unable to convince the farmer that they must have an increase in the price of making. Only by organization and co-operation on the part of the makers in making reasonable demands can any relief be attained in many localities and for the good of all concerned it is to be hoped that permanent relief for such problems will be attained.

Both the dairy farmer and the cheesemakers must realize that the future of the cheese industry depends entirely upon the quality of the goods. Put upon the market only cheese of high grade and there need be no fear of over production—GEO. J. WEIGLE, Wisconsin Dairy & Food Commissioner.

California Items

HOARD'S DAIRYMAN:—Dairymen and other alfalfa consumers are at present greatly concerned over the short hay crop. With the exception of a few spots, there is a general shortage of alfalfa throughout the state, and reports indicate that the shortage is general throughout Nevada and Arizona. Alfalfa growers in these three states are unable to meet the demand for hay. To conserve the supply for local needs, the alfalfa growers of California, Inc., are not shipping alfalfa meal out of the state.

In Modoc County, where feed is usually plentiful, nearly 100 head of Holstein dairy cattle were offered for sale by Roberts & Summers the other day at public auction, giving as the reason for the sale, the shortage of pasture and feed. In the Sierra Valley, where harvesting is now in progress, reports state that there is a heavy crop where there was plenty of water for irrigation but that the crop is short elsewhere. In the San Joaquin Valley, farmers under the Modesto Irrigation District Control will receive water up to August 1st according to a report of the chief engineer, this being an effort to relieve the shortage of alfalfa by making it possible for farmers to harvest an additional crop.

Throughout the hay sections, the movement of the crops is being retarded because of a shortage of cars. In some sections this shortage is acute. California depends on the East for its cars, and none are coming in because of congestion and shortage in the East.

Alfalfa prices, in consequence of all this, are high. In addition to the short crop, everything that goes into the production of alfalfa and alfalfa meal tends to increase the price this year, wages, baling costs, freights, storage, etc., all being higher.

The result of these high prices places California dairymen in a hard position. They are up against the proposition of quitting business or raising prices for their products, a thing that is not easily done in the face of public opposition. The State Market Director is said to have admitted that dairymen will either have to raise prices or close down their business. It is reported from various sections of the state, notably in Imperial where cotton growing is coming into favor, that many dairymen are selling off their herds and going into other business.

On the other hand, dairy farms are changing hands and being restocked in certain localities. Near Modesto, Joe Vosti has sold his 160-acre ranch to F. Patocchie and Son of Oakdale for $75,000. The new owners will restock the ranch with 200 head of dairy cattle. Similar changes have taken place the past month in the various dairy sections.

Oakland, Cal. L. L. D.

Jersey Cattle Notes

For week ending July 23rd:

Number of animals registered: Bulls, 300; cows, 688; total, 988. Number of transfers recorded: Bulls, 219; cows, 1,109; total, 1,328.

Milk Bar at Picnic

HOARD'S DAIRYMAN:—In spite of the fact that farm labor is about impossible to get and farmers are overworked, farmers' picnics are more frequent and better attended than in former years. One of these affairs came off recently at the county seat of Delaware County, N. Y., and the attendance was estimated at 1,000. The State School of Agriculture at Delhi, the County Farm Bureau, the Dairymen's League, and the Grange were the organizations particularly responsible for putting on the picnic, but the college of agriculture contributed in the way of a milk show and bar.

Of course, games were a feature and there was music; these cannot be omitted from such a gathering. The fields and buildings at the school were visited. The grange and the bureau were soliciting members. There were addresses by Grange and League men. Such, at a glance, was the picnic. Of course, there were eats and drinks. Some privileges were sold. What do you think of this? Coffee and soft drinks were forbidden at all booths. All drinks sold must be milk drinks.

Some folks do not like milk drinks, but, never mind, you wouldn't suspect you were drinking milk the way some of those drinks were put out. Mine was chocolate. I do not care particularly for milk to drink, but that tablespoonful of chocolate, sugar, etc., in the glass of milk, well shaken together, made the taste equal to the best put out at the soda fountain.

Any fruit juices, such as strawberry, raspberry, etc., can be used in the same way and you are really getting something when you buy milk flavored after this fashion. This with milk, buttermilk, etc., were sold at the milk bar at very reasonable prices, milk at three cents a glass and buttermilk at two cents.

Mr. Eastman of the League News gave a description of the development of organization in the last four years, at which time he came into the county as bureau agent. Then there was almost nothing, only something of a grange and a farm bureau just developing. The grange now has in the state practically 125,000 members, the farm bureaus 70,000, and the League 60,000. The bureau and the League has, of course, only men commonly counted as members, while the grange counts women and children. In the county the bureau has 1,200 members and the League 2,700. All these organizations are working unitedly. In addition we have the Exchange which is rapidly getting together a million dollars capital, and the League co-operative that is developing as rapidly as seems safe and sane. Then to go further, there are milk producers' organizations at every city in the country and these are working in the utmost harmony. We are able to say things to the legislatures and have them noticed, and even got about all asked for at the Chicago convention except packer control, and a similar delegation was at San Francisco, not partizan but agricultural.

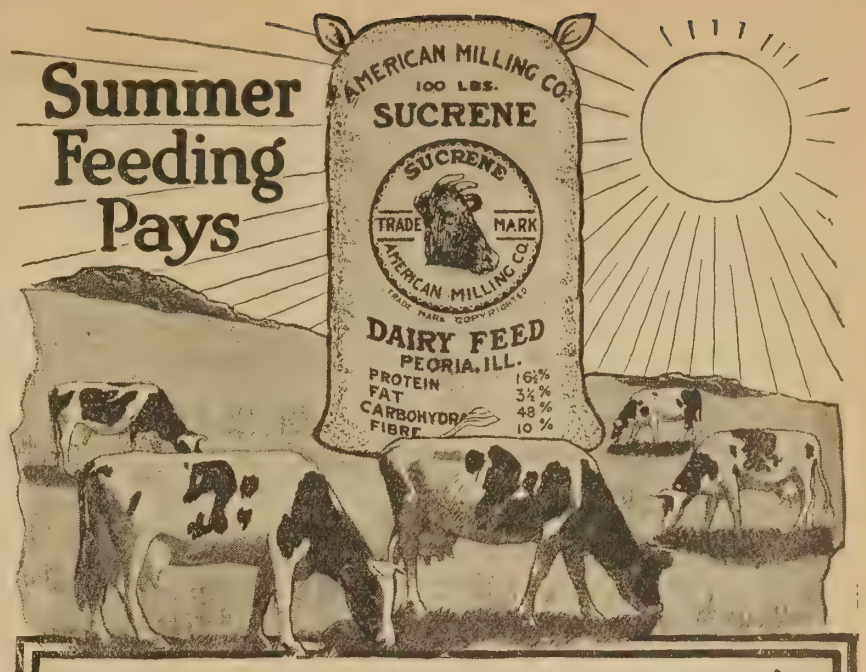
New York. H. H. LYON.

SKIMMILK HOLSTEINS

"These two calves never had a drop of whole milk after they were four days old." So writes their owner, W. E. Bishop of Wisconsin. One was four days under and the other eleven days over six months when the picture was taken. Do they look likely? Calf meal was used with skimmilk in substituting whole milk. Apparently the calves found that feed satisfactory. Feeding large amounts of whole milk to calves is an expensive proposition. With proper management, it is unnecessary.

Has Another View

HOARD'S DAIRYMAN:—On page 1517 of the July 16th, 1920, issue of your valuable paper appears a statement to the effect that my "headquarters are in Washington and backed by the packers and margarine interests," and that my recent address before the Interstate Cottonseed Crushers' Association "was an appeal for vigorous and concerted action against the butter industry." This interpretation of my address is an incorrect one.



The "packer", as the term is generally understood, is not contributing one cent to the expenses of this institute. Only a small part of the margarine industry is backing it. The rest of the industry may or may not be in sympathy with it. For your information I am enclosing a list of the names and addresses of our present membership.

My address was not an appeal for any action against the butter industry. No man can point to a single thing I ever said against milk or milk products. My appeal was for concerted action against laws that make a market for one product by making it impossible to market a competitive product. The man who raises peanuts, cotton, beef, hogs, and cocoanuts under the American flag has as much right in the food markets of America as a man who keeps a dairy cow. Any law that favors the one at the expense of the other is a vicious law and cannot be defended on any theory of government.

My chief function as secretary of this institute, briefly expressed, is to tell the American people the whole truth about margarine and as far as possible to keep other people from telling untruths and half truths about it. The performance of this function ought not to be looked upon as an action against the butter industry.

J. S. ABBOTT.

See editorial comment on page 122.

COWS on grass alone go down rapidly in milk flow and bodily vigor when the drought comes or when the grazing season is over. Spring-freshened cows, fed Sucrene Dairy Feed while on pasture, keep up their heavy milk flow through fall and winter. Fall-fresh cows are in better condition for calving.

"Sucrene Dairy Feed has made me more money than any feed I ever bought. It produces larger quantities of milk at low cost and keeps stock in the best of health, with practically no calving troubles."—Thos. Y. Hackett, Daretown, N. J.

Sucrene Dairy Feed backs up the stimulating effects of grass—is many times stronger than the finest pasture in milk making and body-maintaining nutrients. Butter made from cows fed Sucrene while grazing is firm and crispy—not smeary like butter from cows on grass alone.

Composed of wheat bran, linseed meal, prime cottonseed meal, cocoanut meal, corn gluten feed, corn feed meal, ground and bolted grain screenings, clipped oat by-product, molasses, salt, calcium carbonate.

Guaranteed analysis: 16½% protein, 3½% fat, 48% carbohydrates, 10% fibre.

Try this feed. Order a ton from your dealer. If he cannot supply you write us. The coupon brings you full information on Sucrene Feeds.

The Shedd Jersey Calf Club

F. L. BALLARD, OREGON

THE Willamette Valley in Oregon is known as a famous Jersey center. Enthusiasm over excellent Jerseys extends into the ranks of the boys and girls, and there are several calf clubs in the state which have selected Jerseys as the live stock with which the members prefer to work.

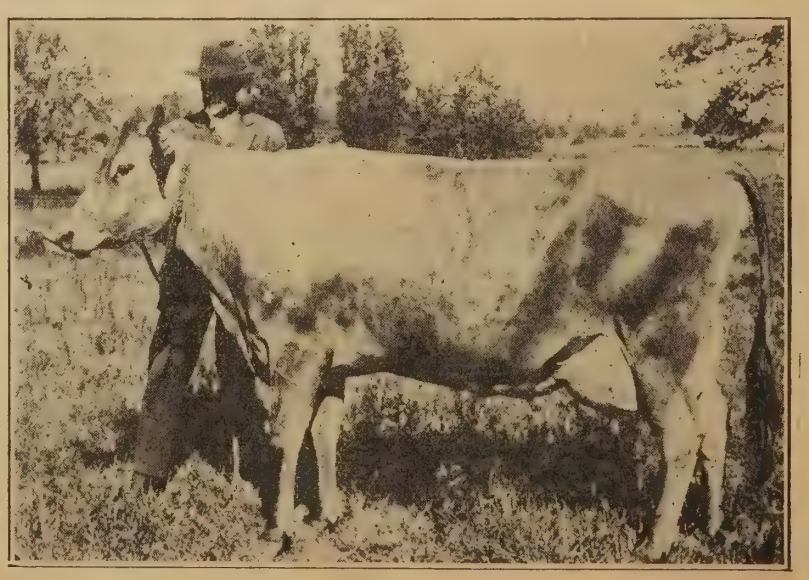
One of the most noteworthy of the clubs is at Shedd, which was visited recently by the breeders who participated in the Oregon Jersey Jubilee. The Shedd Club, composed of 30 boys and girls, all owning Jerseys, was one of the first in the United States to be awarded a $75 prize by the American Jersey Cattle Club. The influence of this number of young people in a rural community grouped together for the purpose of studying and practicing the fundamentals of live stock care and improvement, is felt well beyond the membership of the club. The entire community is proud of the work of the young people, and large gatherings assemble whenever the club holds a special meeting, judging demonstration, or exhibit. An annual community fair is held by the young people in conjunction with the local Shorthorn club. This event is largely attended. The club is training what promises to be a strong stock judging team to participate in county, state, and inter-state contests this fall.

Recently on the occasion of the Jersey Jubilee, three hundred persons devoted an hour to viewing the calves which were exhibited by 27 of the 30 members. The club members participated in a general program, a feature of which was an address by President Munn. Officers of this organization of future dairymen and farm women are Harold Troutman, president, and Elene Davis, secretary.

Mrs. C. W. Shedd, who acts as local leader, is largely responsible for the enthusiasm which pervades the Shedd Calf Club. S. V. Smith, county agent, and L. J. Allen, state live stock club leader, have also devoted considerable time to assisting the club members with their problems.

SHEDD, OREGON, JERSEY CALF CLUB

Another Jersey Breaks World's Record



POPPY'S Dortha, owned by Frank E. Lynn, Oregon, has established a new world's record for junior three-year-old Jersey cows by making 17,904 pounds of milk, 994 pounds of butterfat, in a year's test.

Mr. Lynn gives an interesting account of the record in these words:

"I was not doing testing when this cow freshened and had no intention of starting her, so she had no grain of any kind for two months before freshening and was not prepared for a test in any way. It was only after she started milking so heavily that I decided to again start testing. Even then I had no idea that she could make a world's record.

"It was only after six months that I realized she really had a chance to make a remarkable record, and she was then fed and milked at regular intervals, although she was not coddled in any way. She has never had a blanket on or had her drinking water warmed in the coldest weather.

"Her feed for the last six months of her test was 12 pounds mill-run,

FRANK E. LYNN OF OREGON AND HIS WORLD'S CHAMPION JERSEY COW, POPPY'S DORTHA

9 pounds chopped oats, 6 pounds beet pulp, and 3 pounds oil meal. She also had 50 pounds of silage and 30 pounds of kale per day until the first of May, when she was turned on pasture. One of the cow's peculiarities is that she knows when she has had enough to eat, and will not take any more feed than is good for her."

This statement, coming from the man who owned a cow that did not appear to be championship material, emphasizes again the fact that appearances are ofttimes deceiving, and that the best way to tell what a cow can do is to put her on official test.

Poppy's Dortha comes by her productiveness through inheritance, as her pedigree shows her to be a granddaughter of Rosaire's Olga Lad, a gold and silver medal bull, and her grandam on her dam's side is St. Mawes Poppy, a cow with three official records of over 700 pounds of fat, the highest of which was 952 pounds fat. In her next generation she reveals the blood of St. Mawes, a gold medal sire. This adds further evidence that great producers reproduce, and offers valuable material to students of dairy cattle breeding.

Besides being the new three-year-old champion, Poppy's Dortha has won the distinction of having made the fifth highest fat record, the sixth highest milk record of the Jersey breed, and the highest milk record ever made by a Jersey under seven years of age.—AMERICAN JERSEY CATTLE CLUB.

Sawdust Chemically Treated is Tried as a Stock Food

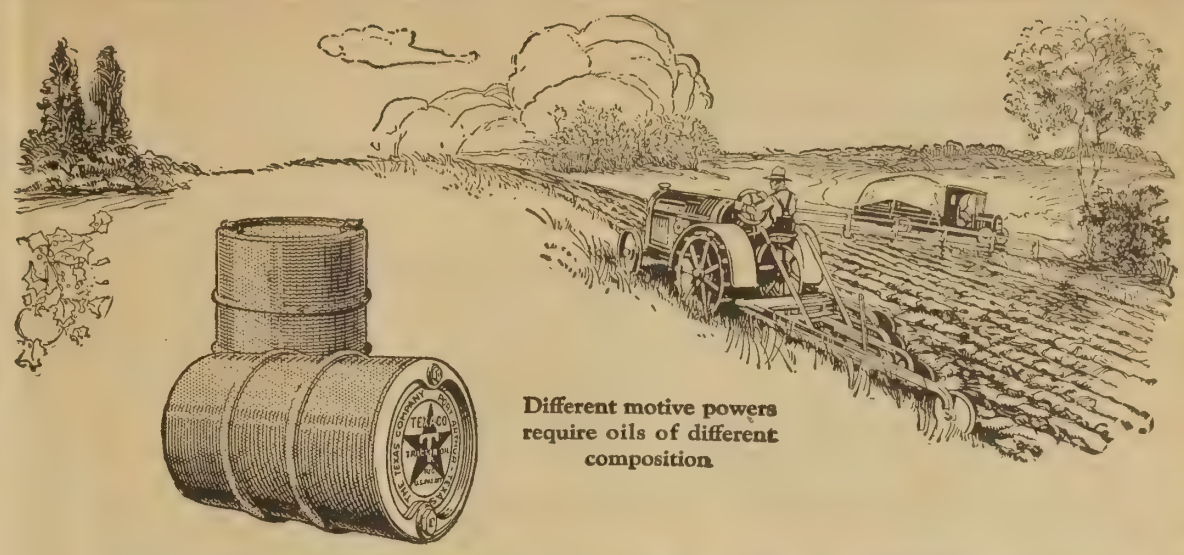
Sawdust as a possible feed for stock has been considered favorably for many years, but it remained for the Forest Products Laboratory and the Wisconsin College of Agriculture to conduct the first trial.

The feeding experiments in which chemically treated softwood sawdust was fed were under the direction of F. B. Morrison of the College of Agriculture. The sawdust was prepared by means of a new process perfected by E. C. Sherrard of the Forest Products Laboratory. The amount of treated sawdust which could be prepared under laboratory conditions was limited so that only a short feeding test was made. More extensive trials will be necessary before definite conclusions can be made as to the feeding value of the hydrolized sawdust.

"Three cows were fed for three periods of four weeks each. In the first and third feeding periods," says Mr. Morrison, "the cows were given an excellent ration consisting of alfalfa hay, corn silage, and a concentrate mixture consisting of 55 parts of ground barley, 30 parts of wheat bran, and 15 parts of linseed meal. In the second feeding period the hydrolized or treated sawdust was substituted for a part of the barley in the mixture. Two pounds of sawdust were used in place of one of barley. The grain mixture then consisted of 30 parts of sawdust, 40 parts of ground barley, 30 parts of wheat bran, and 15 parts of linseed meal. The cows kept up their production through this period and maintained their weight even better than on the ration fed during the first and third periods.

"While it is unsafe to draw definite conclusions from such a short test, it would seem that cattle may be fed a limited amount of hydrolized sawdust. As a feed it contains only a negligible amount of protein and for that reason cannot be compared with barley. In both of the rations used in the trial the protein was furnished by the other feeds. Before attempting the manufacture of this new feed on a commercial scale it will be necessary to carry on much longer feeding tests to find out whether the sawdust has any injurious effects when its use is long continued," says Mr. Morrison.

"Sensational reports circulating to the effect that the saving in feed will be enormous and that the use of sawdust will revolutionize the dairy industry are false and misleading," states Mr. Morrison. "No one can yet state whether or not it will prove of practical application."



Making Hydrolized Sawdust

"Hydrolized sawdust is not ordinary sawdust, but that which has undergone many changes through chemical treatment. It requires clean sawdust from certain woods; some sawdust cannot be treated. The first step in changing the sawdust is to treat with dilute sulphuric acid for from 15 to 20 minutes under a steam pressure of 115 pounds to the square inch. During the cooking about 25 per cent of the dry weight of the wood is changed into sugar and the fibrous part of the wood is greatly changed, becoming brittle and friable, an intermediate product between cellulose and sugar," explains Dr. Sherrard.

"The sugars are then extracted from the digested dust with hot water and the sulphuric acid removed by neutralizing with lime. After settling or in some cases after filtering, the sugar solutions were evaporated to a thick molasses under reduced pressure and mixed with the digested residue which had been partially dried. The mixed material was then placed in an oven and dried at a temperature of 70 to 80 degrees C. until it contained not more than 12 per cent of moisture. In this handling some sugars were lost so that in the final product the sugars averaged from 14 to 18 per cent of the dry food. It has been found that the sawdust free from chips and pieces of bark is best suited for this purpose since a more even penetration and digestion is obtained with the smaller particles."

From experience and data gathered from investigations upon the preparation of ethyl alcohol from wood, Dr. Sherrard believes that similar feeds can be obtained from any of the non-resinous coniferous woods and perhaps some of the more resinous woods. Larch should be partially adapted to this use since it contains approximately 12 per cent of galactin, a compound which gives rise to galactose upon treatment with dilute acids.—Wisconsin College of Agriculture.

TEXACO MOTOR OIL ★ THUBAN COMPOUND ★ HARVESTER OIL ★ AXLE GREASE

Different motive powers require oils of different composition

TEXACO
TRACTOR OIL

Are you using the same oil in your tractor as you use in your automobile or truck?

Compare the work done: The average auto motor carries a relatively light load with many periods of rest. The tractor motor develops its full-rated power with wide-open throttle the whole day long. Higher explosion temperatures and higher pressures must be dealt with. A heavier and more substantial oil must be used.

TEXACO TRACTOR OIL meets the conditions perfectly. It does the work without excessive thinning down. It burns clean—without excessive carbon deposits. It withstands the greatest pressures. It reduces wear. It means more power.

It comes in 33 and 55 gallon well-built steel drums, wooden barrels and half-barrels, and five-gallon cans. Try it. You'll see a difference right away. You'll find it mighty cheap compared to replacing worn parts or frequent repairing.

BEFORE USING TARVIA
South Denton Street, Gainesville, Texas, a gravel road before treatment with Tarvia. Note how road has gone to pieces under traffic.

AFTER USING TARVIA
The same section of street after resurfacing with local gravel, made smooth, dustless and traffic-proof by treatment with "Tarvia A" and "Tarvia B".

"There are no arguments against saving what you've got"—

THE war taught us many things, not the least of which was thrift—pertinently termed "saving what you've got." Thrift showed us that last year's shoes could be resoled and that the old suit—with little mending and pressing—had another year's wear in it.

It showed many cities and towns that the policy of "saving what you've got" could be applied to their road problems. They reasoned this way:

"High costs may offer good arguments for delaying new road construction at this time, but *there are no arguments against saving what you've got.* To neglect the roads already built is waste, and *waste is a crime.*"

If your macadam roads are good, keep them good; if they are in bad shape, *repair them!*

That may mean Tarvia patching and surface treating; the widening of narrow roads by adding Tarvia macadam shoulders, or it may mean utilizing the old macadam as the foundation for a traffic-proof Tarvia top.

Road improvements like these are not makeshift methods. They are the logical solution of the good roads problem in hundreds of communities today.

Best of all, the cost is low, the maintenance cheap and the satisfaction a blessing to the entire community.

Tarvia roads are mudless, dustless, waterproof and frost-proof. The smooth-running, durable surface resists the hardest traffic.

Our engineers will gladly consult with you, without obligation, in solving your road problems with Tarvia.

Special Service Department

In order to bring the facts before taxpayers as well as road authorities, The Barrett Company has organized a Special Service Department, which keeps up to the minute on all road problems.

If you will write to the nearest office regarding road conditions or problems in your vicinity, the matter will have the prompt attention of experienced engineers. This service is free for the asking. If you want *better roads* and *lower taxes*, this Department can greatly assist you.

Illustrated booklets of the various Tarvia treatments free on request. Address nearest office.

DECLINING FEED PRICES

SANDERS SOSLAND, MISSOURI

THE feedstuffs industry of the United States has entered, or at least is about to enter, a new era in prices. Not in many months, if at all in the past few years, have such broad and general downturns in values occurred on markets as have been recorded within the past month. The commodities used on a large scale in the rations for dairy cattle have shared generously in the price depression. For instance, bran is more than $15 a ton lower than the high point of values reached in the early summer period, when the trade was marveling at the ability of the offal to maintain the record height. Alfalfa hay has declined about $12 a ton, and alfalfa meal and alfalfa mixed feeds have suffered similar depression. Since the inauguration of trading in cottonseed cake and meal for new crop shipment, the market has receded about $10 a ton. Corn and oats, in fact practically every important feed, have declined sharply in price.

One is not obliged to scan market gossip closely to discover the basic influences contributing to the strong bearish pressure on prices for feedstuffs. Enormous feed crop production is the bear club. The excellent outturns of feed crops thus far, including oats, barley, other grains, alfalfa, clover, and prairie hay, and the ideal condition of crops which are yet to be harvested, particularly corn, the sorghum grains, cotton, and flaxseed, and plants of lesser importance, have brought about a sharp reduction in the demand on markets. Pastures in every section of the country are in excellent condition and are being utilized more generally than during any summer or fall of recent years.

Serious drouth or prolonged dry spells have in the past few years stimulated sharply the demand for feeds during the summer months, this having served to offset the effect of the enlarged supply resulting from harvests. The buying came from the Southwest, possibly Texas, Kansas, and surrounding states, or the far West, such as California, Nevada, and Utah, or from the Middle West, the Northwest, Northeast, or the East. Buying of feed to tide over stock through a drouth period usually is on a larger scale than actual needs require, the fear of a bulge in prices because of the weather conditions and possible crop failure stimulating the demand. Nor is the buying confined merely to the feeders within the drouthy areas; demand develops from other sections, due to the excitement which is created in the general trade. However, this is not the condition today. Not only is the excellent growth of pastures checking the demand for feed, but it is increasing on a large scale the surplus available for commercial marketing channels.

So far as the dairy industry is concerned, most attention centers around the price movements in the market for bran, the offal of the flour mill. Millers, jobbers, the country merchant, and the dairyman have come to look upon bran in recent months as a luxurious feed, and have thought of the offal in terms of $50 and even $60 a ton. The speculative element, or that portion of it which considered bran high around $40 to $45 a ton in the Middle West during March and April, pocketed heavy losses on short accounts. Naturally, when the trade entered July with a market around $50 a ton, few were willing to sell short for deferred shipment, despite the large alfalfa and other crop outturns and the excellent condition of pastures. Instead, there was a considerable "long" interest in the bran market. The bulls of the earlier months were so confident of their position, basing their views largely on the prospects of a very light production by mills of the country during July, that they bought large quantities for deferred shipment. No doubt they would have realized a profit if the drouth of former years had developed, which would have sustained the interior local demand. But the buying strength of the country fell off to an insignificant volume, with the result that production of the offal by mills, while comparatively scant, was large and burdensome in contrast with the demand.

So bran has declined, and promises to decline further. On the Minneapolis market, the leading spring wheat terminal, bran is available around $43 to $44 a ton for spot shipment, sacked; in Kansas City around $44, and in St. Louis and Chicago around $46 to $47 a ton. At the present writing, jobbers are offering bran for thirty-day shipment at a discount of five to ten cents under the spot market, and for sixty- and ninety-day delivery, important milling points have recently quoted down to $40. But the trade is of an insignificant volume in the deferred deliveries and does not fully reflect the sentiment of market operators as to the probable price movements up to October. The important fact concerning the trade position is the freer selling than the volume buyers are willing to absorb. The

PERGUE'S CRESCENT, GUERNSEY COW OWNED BY SASS BROS., ILLINOIS
She has produced 13,316.9 lbs. milk, 581.01 lbs. fat, in one year and holds second place in Class EE.

selling pressure is coming from both mills and the speculative trade, the latter being forced to unload their holdings upon the market when received, owing to inability to find an outlet such as was previously anticipated.

The outlook for bran is naturally bearish. Since the high point of values in May, prices have receded approximately $12 a ton. If it has been possible to witness such a sharp depression during a period of very light production and small stocks in the hands of the consuming trade, what may be expected when mills begin operating at full capacity? It is only reasonable to anticipate further downturns the remainder of the summer, which might possibly extend into the fall season. The stocks of flour in consuming channels of the country have dwindled sharply, and with a more settled tone in the market for wheat, bakers, jobbers, and other buyers will begin to accumulate their stocks. Millers in both the spring and winter wheat sections are confident of a broad domestic demand by the middle of August, and full time operations by the opening of September are quite probable. This, of course, means production on a full capacity scale of bran and shorts.

Whether demand for the offal will increase in proportion to the enlarged production by mills is a question, however. Much depends upon the character of the weather. A late summer drouth, which is a possibility, would doubtless stimulate sharply the demand for bran, and with the present low stocks in hands of the consuming trade, a wave of buying overbalancing the increased production could easily result. However, there are no signs of drouth for the immediate future, and a continuation of present favorable weather with outturns of late feed crops such as now promised would have a depressing influence on the later trade. Unless the unusual occurs, the dairy trade can arrange its buying of bran on the theory that prices will continue on a downward scale. And that means buying on a hand-to-mouth basis or only for current needs will prove the most profitable.

Hog producers have not thus far enjoyed the lower scale of prices in their purchases of shorts, the heavier offal of the flour mill. Light production was the basic factor in the maintenance of values at near record levels, but it required a semblance of demand to sustain prices. Demand for the heavier offal has not been broad and generally active, but there was sufficient buying of a scattered character to absorb the scant supply available on the market. Some of the buying of shorts in recent weeks, it is interesting to note, came from mills themselves, their production having dwindled to a point below the actual consumptive needs of the local trade. Gray shorts or flour middlings at the present writing are bringing around $62 a ton on the Minneapolis market, $61 in Chicago, $60 to $61 in St. Louis, and around $57 to $58 in Kansas City. Brown shorts or standard middlings have not met with any important demand, selling around $54 in Kansas City, $54 to $55 in Minneapolis, $55 in Chicago, and about $56 in St. Louis. There is at present a premium of approximately $15 a ton on shorts over bran, a very abnormal difference, but this disparity will not long prevail. Shorts should work downward more rapidly than bran.

Alfalfa and other varieties of forage have felt probably more than any other feedstuffs the effect of excellent pasturage. Hay is in a very weak position, only the acute shortage of cars and the partial breakdown of the nation's transportation system checking declines in prices. The lack of baling wire and ties and the scarcity of labor on farms are contributing influences to the restricted movement of hay to market, but are playing only a minor part as a bullish influence in the general trade. It is important to remember that in the past crop year the shortage of cars and motive power for moving hay from the country to terminals was the basic factor in causing the upward swing of prices. Of course, there were other influences tending to force the market up which do not prevail on the current trade, including short production in the East, the northwestern and southwestern dry spells and scarcity of other feeds. Many in the hay trade, while manifesting doubt whether values will soar to the high levels reached in the past crop year, believe the car situation sufficiently bullish on the market to at least maintain prices around current levels.

Demand for alfalfa is of a scattered character. Some hay is moving to the east, southwest, and the north, but no section is buying on a generous scale. The fact that clover production in the East is considerably greater than a year ago is reducing demand for alfalfa from the dairy districts of that territory, and this will tell later in the crop season. Much forage and roughage is available in the South and Southeast, and while that territory will buy considerable hay, the extent of purchases will be dependent to a great extent on the prosperity of the cotton belt, which is largely based on the price of cotton. Alfalfa production is somewhat greater than a year ago in the West, and the quality is far

Cletrac
TANK-TYPE TRACTOR

Wheels on a track—the Cletrac way—take less power

Fall's the Time to Plow

FALL-PLOWING turns sod and stubble into rich food for next year's crop and stores reserve moisture for hot, dry spells.

Get going with a Cletrac the day you finish harvesting. Then, if spring comes late, you'll have plenty of time for seed-bed work and be ready to plant at just the right time.

The Cletrac plows fast, breaking up the soil into well-mulched furrows that completely bury trash, stubble or cover crop. And it keeps plowing steadily all fall unless there's an important belt job, hauling or other work for it to do.

An improved water air-washer protects the powerful motor from dust and dirt. Broad, ground-gripping tracks carry this tank-type tractor over any soil in any weather.

If you're still using horses sell some of them *now* before they eat up this year's profits. Break in your Cletrac this fall and be all lined up for a quick start next spring. Talk to the Cletrac dealer near you or write for more information.

The Public Confidence

An important part of the management of the Bell System is to keep the public informed concerning all matters relating to the telephone.

We consider this an essential part of our stewardship in the operation of this public utility. It is due not only the 130,000 shareholders, but it is due the whole citizenship of the country.

We have told you of new inventions to improve service, of the growth of service, of problems involved in securing materials, employing and training workers, of financing new developments, and of rates necessary to maintain service.

You have been taken into our confidence as to what we are doing, how we do it, why we do it. You have been told of our efforts to meet unusual conditions; of how we have bent every energy to provide service in the face of storms, floods, fires.

It is an enormous task today to provide adequate service in the face of shortage of workers, raw materials, manufacturing production and transportation.

Nevertheless the service of the Bell System has been improved and extended this year. Over 350,000 new stations have been put into operation. And the loyal workers of the Bell System are establishing new records for efficiency and will establish new records for service.

Calves Make Smaller Gains on Skimmilk Fed Cold

HOARD'S DAIRYMAN:—An experiment that will interest dairymen who feed skimmilk to calves was recently completed at the United States Dairy Division experimental farm, Beltsville, Md. The results of this work indicate that calves fed on cold skimmilk make smaller total gains and smaller gains per pound of milk, than when the skimmilk is fed warm, or when fed warm and cold alternately.

It is commonly believed that cold skimmilk, or sour milk, when fed to calves will cause scours. Earlier work has shown that the sourness of milk itself will not have this effect. It was therefore desired to test the effect of cold skimmilk and to find out the relative gains that will be made on warm and cold skimmilk.

Twelve calves, balanced as nearly as possible with reference to breed and body weight, were used in the test, and were divided into three groups of four each. The skimmilk feeding began when the calves were 10 days old, with the exception of one calf, which was 20 days old. The experiment ran for 60 days. One group received skimmilk at a temperature between 90 degrees and 100 degrees F. Another group was fed warm and cold skimmilk in alternate periods of two days, the cold skimmilk having a temperature ranging usually between 50 degrees and 60 degrees F., although it sometimes went lower. The third group was fed cold skimmilk at a temperature averaging a little above 50 degrees F. Each calf was fed 12 lbs. of milk daily until it attained a weight of 100 lbs., when the quantity was increased to 14 lbs.

Result of Feeding Skimmilk Warm, Cold, and at Alternating Temperatures

Group	Initial weight lbs.	Final weight lbs.	Total gain lbs.	Daily gain lbs.	Total skimmilk lbs.	Milk per lb. of gain lbs.	Temperature of milk F°
Warm skimmilk	88.2	139.2	51	.85	803.5	16.35	93.02
Alternate warm and cold skimmilk	90	144	54	.90	801.5	15.12	71.97
Cold skimmilk	85.5	122	36.5	.61	775	24.47	52.2

Cold Skimmilk Chilled Calves

This experiment was conducted during the winter months, at which time it is probable that the cold skimmilk will show to poorer advantage than during warmer weather. It was noted that the cold milk was taken by the calves less readily than the warm milk, and that it chilled them. One calf which started on cold skimmilk had to be dropped from the experiment and a substitute provided on account of its refusing to drink the cold milk. Another calf fed cold skimmilk scoured some but not enough to make it necessary to change the ration, nor to remove the calf from the experiment.

Except for some very slight digestive disturbances, the calves on warm skimmilk, and those on warm and cold skimmilk alternately, went through the experiment in good condition.

It will be observed from this table that the calves which were fed alternately warm and cold skimmilk apparently did a little better than those fed warm skimmilk. Those fed cold milk alone made much smaller gains. It is not to be concluded from this that alternate feeding as described is advisable, as it is realized that four calves are an insufficient number from which to draw definite conclusions. While no change in the commonly accepted method of feeding is recommended as a result of this experiment, we can conclude that cold skimmilk is not necessarily productive of scours, and that alternate warm and cold feeding gives better results than cold feeding alone.—United States Dairy Division.

HOLSTEIN BREEDERS OF JEFFERSON COUNTY PICNIC

Three thousand people attended the second annual picnic of the Jefferson County Holstein-Friesian Breeders' Association held at Jefferson, Wisconsin, July 8. Even this attendance would have been greatly increased with favorable weather.

Speakers for the day's program were R. C. Pollock of the Holstein-Friesian Association of America; L. L. Oldham, secretary of the Wisconsin Holstein-Friesian Breeders' Association; and A. J. Glover, editor of Hoard's Dairyman. Mr. Pollock outlined the work of the National Association in the organization of state associations and pointed out the advantages gained through co-operative promotion of Holstein interests. Mr. Oldham called on the breeders for increased support of their state association and reviewed the work already being accomplished. Mr. Glover spoke of the Farm Bureau movement and the effort of the Wisconsin Dairy Council. He told of the necessity and wisdom of dairymen supporting their industry through the increased consumption of dairy products on the farm.

In a free lottery to all attendants of the picnic a Holstein bull calf was given to the holder of the winning number. The fortunate one was John E. Fromader, a farm boy.

Cow Waters Herself

with this wonderful new **Libbey Automatic Water Bowl.** Animal moves lever, opening water valve, when it starts to drink. Lever swings back, closing valve, when animal stops drinking.

15% More Milk

Milk is 87% water, and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15% to 20%, which soon pays for the bowls.

Libbey Automatic Water Bowls

are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circular and prices, also FREE DAILY MILK AND FEED RECORD.

If interested in Stanchions, Stalls, Carriers, etc., ask for free General Catalog.

persons. The drivers of the delivery wagons are paid a monthly salary and in addition a bonus is granted them for sales above a specified amount. They have been earning a bonus each month for some time.

We have passed through some dark financial periods but now the future looks bright for our association. A large factor in our success has been the assurance from citizens of our town that they stood ready to help us in times of need. They bought stock in the enterprise and assisted in other ways. But possibly the most important consideration is the proper operation of the plant and its business management. In this respect we have been fortunate in securing the services of J. C. Joslin, formerly manager of the Federal Creamery at Grove City, Pennsylvania.

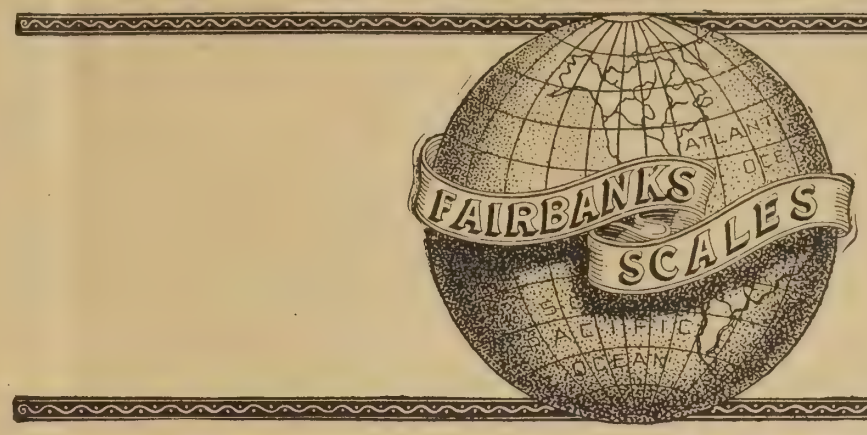
Get Ready for the Tester

HOARD'S DARYMAN:—When doing official testing among Ohio herds I often wanted to tell many dairymen about the advantage to themselves and to the tester if they would fix up a little for the tester's work. I could not do this but now that I have about finished my testing work I can say what I have wanted to say when working.

In summer testing the matter of working equipment is all that matters. Water and a bench to work on are the main ones. But in winter time, when the samples are brought in out of the barn where the temperature is only kept above zero by the heat of the cows, it is a different matter.

The kind of a bottle that the sample is to be taken in is of some importance. A wide mouth is much easier to fill than a tall, narrow bottle. The half pint milk or cream bottles are the best sample bottles I have ever found. They are of a standard that is easy to buy. Any paper cap fits them so if a bottle should be accidently tipped over the sample is safe. I have used everything from a two-quart Mason fruit jar to an olive bottle for getting the samples. Maybe some testers don't care about such equipment but I appreciate things to work with. Such a bottle as the half pint is easy to warm up and easy to mix the sample in just before starting the actual testing operation.

In winter it surely does not pay any owner of cows to send the tester out to a shanty or a milk room where his feet and hands are cold all the time he is making the tests. One can not do accurate work under this influence. Testing is accurate work when it comes to reading fat columns and measuring acid and milk. When fingers are cold this can not be done the best. There is another bigger reason, though, for a warm room. Milk samples do not mix well unless warm. Nor will every bit of the fat come out when reading the fat columns if the water is cooler than it should be. A warm room will tend to make the best working conditions and the test will come the very best.



Running water and a sink of some sort facilitate working. I have worked on farms where I tested a larger number of cows than would have been possible without every convenience to work with, including a 24-bottle steam testing centrifuge. Part of a herd may be milked three times a day and part of it two times. This makes about six hours a day to be spent in the barn watching the cows during milking time. The time left needs to be well put in to get the tests out before the next milking time arrives. With a drygoods box and a pail to dump water in and wash up with I couldn't do this test without dividing it into two sections. This would have cost the owner $6 extra for my time each testing period besides board. That amount will fix up most any farm with a comfortable, convenient place for the tester to work.

Very few testers will be any more careful with a good working condition than without it. Yet a few might. Carelessness most always gets a lower test rather than an exact one or a higher one. In a case of this sort the owner loses. However, when a tester wants to do his very best, no matter what the conditions, he can't do it when working conditions won't allow it. A warm room is necessary. Just a warm stove will not do the business. A fire might easily be warm but the room ought to be comfortable. Clean milk test bottles can not be had without hot water. Some sort of a cleanser for taking the fat from the milk bottles ought to be used, too. Testers can seldom carry a case of any cleanser along with them. They have considerable of a load as it is. The sample bottles ought to be cleaned after each test. One can not do a satisfactory job with warm water alone. The water must be hot or some cleaner must be used. Without conveniences to work with the outfit used is apt to be left dirty for the next run and neither the tester nor the owner will be any ahead in this case.

Not only is a convenient place for washing bottles and milking equipment worth while for the testing times but it is a convenience for every day. Many dairymen do not take the milk buckets or parts of the cream separator to the house for the women folks at all. They can take care of this work in the milk room or dairy and have a good job done at that. Usually the farm dairy furnishes plenty of work for the women folks so such an arrangement would meet with approval from that quarter.

Ohio. EARL ROGERS.

FAIRBANKS SCALES

Accurate Weights now even more important

TO GET first hand facts about your farm crop weights you must have a dependable scale. Such a scale tells you whether or not you are feeding your stock for profit.

It tells you exactly what that stock should market. It assures you greatest returns from your produce.

It checks the weights of what you buy—whether it be fertilizer, feed, live stock or seed.

You should have a Fairbanks Scale for Wagon and Stock use. In your neighborhood it will become the local standard by which all other weights are judged.

Fairbanks, Morse & Co.
INCORPORATED CHICAGO
The Canadian Fairbanks-Morse Co., Ltd., Montreal

PAT. 7-2-07
ANTI-COW-KICKER
Save your temper, your cows, your milk. Does not excite the cow, nor disturb the flow of milk. Indispensible for breaking heifers, cows with sore teats, or vicious kickers. Cannot wear out. Put on or off in 15 seconds. Guaranteed to be an absolutely perfect anti-kicker, or put on loosely as hobble for cow, horse or mule. Price $1.15. Postage extra. Weight 2 lbs. Send for it today, when you need it you won't have time.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, D. C., August 2—Dr. W. C. Fowler suddenly changed his mind last week, after the National Grange had asked him to either produce his records to show what farmers in the milk producing area supplying Washington were "pouring milk on the ground" or else stand convicted of trying to blacken the reputation and standing of all the farmers and milk producers in this area. Dr. Fowler is health officer of the District of Columbia, holding his office at the will of a District Commission, subject to the congress of the United States, and is an open and avowed opponent of higher prices for milk.

As told in Hoard's Dairyman last week in a first letter to the Grange Dr. Fowler said he "had the evidence" but declined to make known the names because "it would not serve any good purpose." In a second letter, the Grange put the other angle of the problem up to him, and he very promptly issued a statement to the newspapers on the day following the receipt of this letter, backing down completely, and announcing that "further investigation had shown that no farmers had thrown away any milk". He saved his face, however, by alleging that a receiving station had been compelled to throw away some milk, after saving the cream, and making a "small quantity of cheese". This may be true.

⚜

Today's Washington papers report a "complaint" filed with the federal officials here, asking for a grand jury investigation of a Maryland—Virginia Milk Trust. The newspaper story sets forth that a gigantic conspiracy is being entered into whereby the milk producers are being involved in a conspiracy in restraint of trade, to hold up the whole consuming public here and force great increases in the price of milk. As a piece of demagoguery the newspaper article is a work of art. The facts are that a new contract is being negotiated between the milk producers and the Maryland—Virginia Milk Producers' Association whereby the association becomes the agent, in fact, of the milk producers. This contract is the same as is being carried out in Baltimore and has been in use there for some time with entire satisfaction. The association contract is no secret to anyone, perfectly open and above board. If the appeal of the newspapers has any result, it will be only that the milk producers will be made to suffer the trouble and inconvenience of proving their own case as they have in every other persecution. In this connection one sentence in the Dr. Fowler letter which the Grange has made public is of interest. In answer to a request for information as to the cost of production of milk in this territory he frankly states that his office has no information on this subject.

⚜

Figures are now available showing the foreign trade in dairy products for the past fiscal year. Net imports decreased during this period, the equivalent of three-quarters of a billion pounds of milk, according to the chart which has been prepared showing all the details, by C. W. Larson, dairy specialist and acting chief of the Dairy Division of the Department of Agriculture. Butter and cheese are now on a net import basis.

⚜

The I. C. C. decision on increased freight and other rates has been widely published and needs no comment here. It will be noted that the valuation which the railroad executives asked to have made the basis of their claims was slashed seriously by the commission. The Farm Bureau Federation attorney, who summed the case up for agricultural interests, asked that this be fixed at a figure not over seventeen billion dollars. The I. C. C. used eighteen billion as their basis. The original claim of the railroads was at least 33 per cent over this figure. Milk rates were given a twenty per cent boost in the I. C. C. decision. This was to be expected, but it means that every milk producers' association has its own fight on hand to keep this rate down, as the I. C. C. decision only established a maximum. It does not of itself warrant a blanket increase to this maximum in every case.

PEARL'S ALPHA, A JERSEY CHAMPION BUTTERFAT PRODUCER OF ARKANSAS

Record: 10,239 lbs. milk, 553.8 lbs. fat at age of 3 years, 8 months.

⚜

Somebody is lying about the wheat crop. The result of it is the slump last week. But it is an ill wind which blows no good, and this is proven by the corresponding slump in wheat feeds. Wheat feeds went down by good sized margins during the past few days. To come back to the wheat situation, the same day the Kansas State Board of Agriculture issues a statement estimating the Kansas crop at 147 million bushels, a former grain administration man says it will be a 175 million bushels and all the newspapers quote the big figure. The day the market took its biggest drop, reports reached Washington of a serious outbreak of rust in southern Minnesota and South Dakota. The reports are well verified, but the market sag continues. Once more it is a question of who is lying?

Storage Butter Contest at 1920 National Dairy Show

When Mr. White, in charge of Dairy Manufacturing Investigations, in the Dairy Division at Washington, suggested to the management of the National Dairy Show that a very important butter class could be added to the contests of the show, i. e., a Storage Butter Contest, and gave his reasons, the management very quickly agreed with Mr. White that it would be a very good class to add. As late as April 26th, the classes to cover this storage butter were agreed upon as whole milk and hand separator cream. By the time the announcements were given to the press, and the form prepared to make entry, there was a very limited time before June 12th for the creamery men to make up their minds to enter these contests, but the proof that a great many creamery men agreed with Mr. White that these storage classes would develop a great interest, is demonstrated by the fact that sixteen whole milk entries were made and forty-five hand separator—in all, sixty-one entries of storage butter now in storage awaiting judgment next October, and we believe this will be one of the exciting events for the creamery men at the Show.—National Dairy Show.

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

New York Dairy News

Holstein Exhibition Herd:—The Holstein herd which is to represent Onondaga County at the state fair in competition for the premiums for county herds, amounting to $850, was selected July 24 by the committee appointed by the executive board of the Onondaga County Holstein Club.

The committee was successful in finding outstanding individuals for its first choice of 20 animals. The animals will be carefully fitted and inspected, and the exhibition herd made up of the best 12.

⚜

Netherland Company Sold?—Arrangements have been made whereby the Netherland Dairy Company will open a milk station at Phoenix, N. Y., according to a recent announcement by officials of the company. It will have a capacity of 200 cans of milk a day. Officials of the company believe the opening of this station will mean a great deal to the milk producers of this section, as the business will amount to $15,000 a month, or $180,000 a year. The opening of this raw milk station will mean a permanent market for raw milk at Dairymen's League prices, with a premium for quality.

It is rumored that the Netherland Dairy Company will soon merge with the Sheffield Farms Company. The Sheffield Company operates a large milk station near Tully.

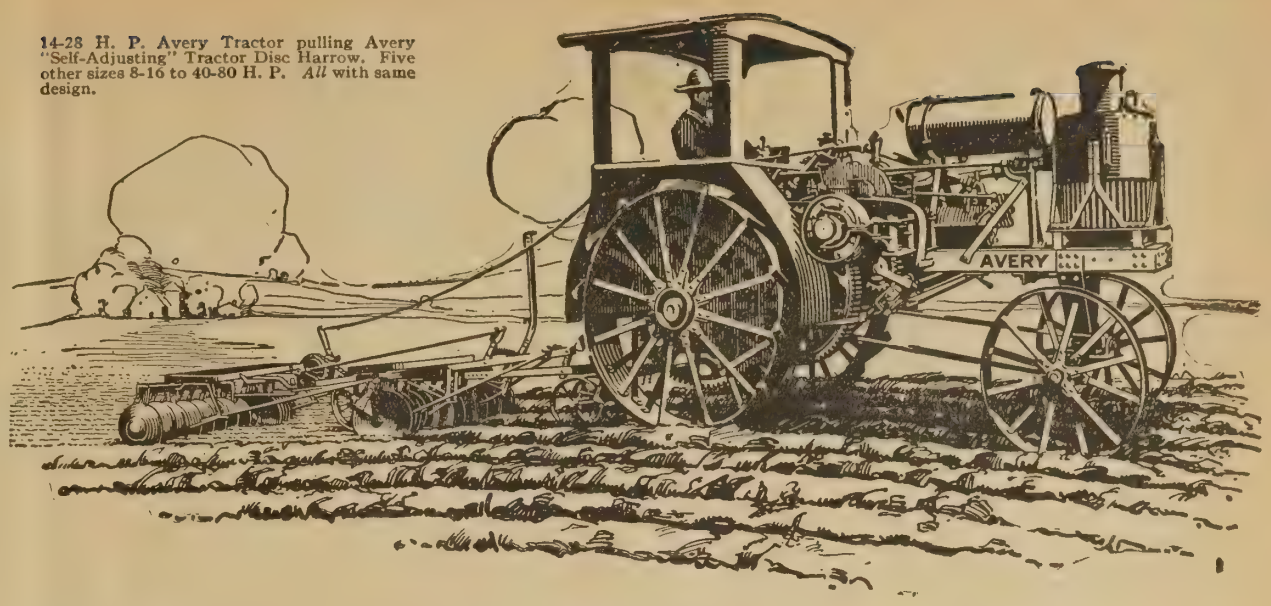
⚜

New York Leads in Holsteins:—New York State leads the country in the number of pure-bred Holstein cattle it possesses, according to a report just made public by the Holstein-Friesian Association of America. The statistics are based on returns made in the census which the national organization has been carrying on during the past year.

New York State has a total of 83,546 pure-bred Holsteins, more than all the New England States put together. These states have a total of 27,702.

Wisconsin, which was popularly believed to be the biggest Holstein state in the country, has 58,092 head. The report shows that New York leads Minnesota, Illinois, Michigan, and Ohio combined by 219 head. The total of the four states is 83,327.

⚜



Creameries for Sale:—Much comment is being made on the large number of cheese factories and creameries combined that are being advertised for sale throughout New York State. Some of them have done a large business for over fifty years.

⚜

Imitation Cream:—The state and city authorities' attention has been called to the fact that a fraudulent thing is occurring each day in New York City and Brooklyn, that will prove injurious to the public health as well as the milk industry if allowed to go on. A mixture of skimmilk, butterfat, and vegetable oil is being sold as a substitute for cream. The cans are labeled "Neucream", "Neu-Kream', "Newco", or some similar name. Then the product is sold to so-called "splitters", chiefly, who mix it with skimmilk and a little cream and sell to retailers. After it leaves the "splitters" hands, this sour cream combination is sold as "Pasteurized cream—grade B". Most of it is being sold on the East side and some in Brooklyn. Large quantities are said to be marketed in Connecticut.

To protect themselves, a number of the larger sour cream dealers have organized an association called the Merchants' Pure Cream and Can Protective Association, designed to eradicate the sale of adulterated cream and to insure the return of empty containers. This new association is conducting an educational campaign by placing warning ads in the Jewish papers of the city and are taking energetic steps to stamp out the fraud.

New York. E. M. L. BLANCHER.

14-28 H. P. Avery Tractor pulling Avery "Self-Adjusting" Tractor Disc Harrow. Five other sizes 8-16 to 40-80 H. P. *All* with same design.

Get Your Avery Now When You Need It Most

Fall time is indeed *tractor* time—the time when the advantages of power farming are many—the time when an Avery will mean most to you in getting your work done in the right way. With an Avery *now*, you can get your fall plowing, discing, harrowing, seeding all finished double quick—also have your own power for threshing, silo filling, shelling corn, grinding feed, road work and other power jobs.

You may have said, "Some day I will have an Avery." Why wait till "someday" when having an Avery *right now* would mean so much to you in speeding up your work, getting it done in the right way, and insuring a big next year's crop.

A Size for Any Farm

You can get an Avery in just the right size to fit your needs best. Also "Power-Lift" Moldboard or Disc Plows to fit any size Avery Tractor and "Self-Adjusting" Tractor Disc Harrows and "Power-Lift" Tractor Grain Drills. All these tools are operated from the tractor platform—real *one-man* outfits.

When you get an Avery you put speed and certainty into your farm work. Five sizes of Avery Tractors from the 8-16 to 40-80 H. P. have the low speed, heavy-duty **"Draft-Horse" Motor**—the motor that gives years of service with minimum upkeep cost. Has Renewable Inner Cylinder Walls, Adjustable Crankshaft Boxes, Valves in Head, Centrifugal Gasifiers that burn *all* the kerosene, and many other exclusive features.

The power is delivered through the **"Direct-Drive" Transmission** with only three shafts and straight spur gears between the motor and the drawbar. Belt pulley is mounted *direct* on the crankshaft—you get all the power of the motor in the belt. That's why the Avery is the real puller in the belt and at the drawbar.

Write for Catalog

Get your Avery now when you need its service most in getting a good crop started for next year. See your local Avery dealer or write us for catalog showing complete Avery line of Tractors, Tractor Drawn or Tractor Driven Machinery.

Avery Six-Cylinder Model "C". A small tractor making a big hit. The Avery 5-10 H. P. is similar to this model but smaller.

Avery Motor Cultivator Harvesting—one of the most useful power machines ever built for farm work. One and two row sizes

Avery Separators are the Champion Grain Savers. Hyatt Roller Bearing equipped.

AVERY COMPANY, 6108 Iowa St., Peoria, Ill.

Branch Houses, Distributors and Service Stations Covering Every State in the Union

AVERY

Motor Farming, Threshing and Road Building Machinery

Avery 40-80 H. P. Special Road Tractor. Built in five sizes—make better roads at less expense.

Silage Investigations

The work of many scattered investigators has shown that almost any plant, preserved as silage, makes palatable good feed. Among the plants which have been thus preserved and have yielded satisfactory ensilage are:—besides corn and sorghum—sunflowers, sweet clover, various grasses, cockle-burs, Canada thistle, bull thistle, Russian thistle, and others. It is practically certain that any plant not too woody will make desirable feed as ensilage. Apart from their fiber content, these plants all show very similar content when analyzed, and some of them which are not palatable as green plants become palatable after fermentation in the silo.

From these facts it becomes evident that the outstanding consideration in a silage plant is the one which will give maximum yield, provided it does not present too great difficulties in preparing for the silo.

Recent investigations by the Office of Forage Crop Investigations have shown that ordinary oil barrels make extremely efficient experimental silos in which silage tests can be made from a relatively small area of land. These experiments have likewise demonstrated that the factor of enormous importance in securing good silage is the exclusion of air as completely as possible. Under such conditions alfalfa made extremely good silage whereas ordinarily—that is, when the air is not fully excluded—it tends to forego putrefactive fermentation and becomes ill-smelling.

During the present season the office is growing a very large variety of plants which produce large tonnage and is putting up silage from each of them.

In the United States, broadly speaking, corn is the principal silage crop throughout the region in which it is grown. In the drier regions it is mainly replaced by sorghum. In the extreme South, along the Gulf coast, Japanese sugar cane and Napier grass are being used extensively. And in the extreme northern states, too cool to obtain large yields of corn, the sunflower is meeting with high favor. For special parts of the country it is very certain that among the plants being experimented with are some which will yield larger tonnage per acre than any of those mentioned.—C. V. PIPER, United States Department of Agriculture.

A Correction

In the illustration appearing on the front page of our issue for July 30, bearing the legend, "Carved Out of the Forest", we inadvertently made the statement that this farm was owned by Murphy Brothers. As a matter of fact, the farm is known as Murphy Farm, and is owned by Frank E. Murphy and his nephew, E. N. Murphy.

EDITORIAL COMMENT

It is estimated that at least 30 per cent of pure-bred bull calves born are sold for veal. This is unfortunate. A certain number of bull calves should be sold for veal but in view of the fact that a large majority of the dairy herds in this country are headed by scrub bulls, it shows that only a few people appreciate improved dairy blood and that the breeder has large opportunities in educating these men to see that there is more profit in keeping a pure-bred bull than a scrub at the head of the herd.

It is very doubtful whether any pure-bred bull calf should be vealed until all of the scrub bulls have been eliminated. In dairy sections, we believe the farm bureau could engage in establishing agencies through which the pure-bred calves could be distributed to dairy farmers owning scrubs. Only a few states in the past year or two have provided ways and means of saving the pure-bred bull calf and eliminating the scrub.

The indifference to the spread of bovine tuberculosis is appalling. It seems that some feel, even with all the demonstrations which have been made, that tuberculosis is not a disease to be dreaded. These men are blind to facts and to their own financial returns. They do not appreciate that the person who keeps tubercular animals is paying the penalty. The United States Department of Agriculture, in its Weekly News Letter, gives an example of how tuberculosis, if uncontrolled, runs its course through a herd of cattle.

A report of a field inspector gives an incident where every animal in a herd of grade Holsteins and Jerseys reacted to the tuberculin test. The herd consisted of 14 cows, 2 calves, and 2 bulls. Upon post-mortem examination, six of the animals showed such extensive lesions that the entire carcass was condemned and destroyed. All other reactors likewise showed lesions. The hogs of this farm were likewise infected.

Last winter the farmer shipped 50 of his cows to market and after 21 had been slaughtered, the remaining number was refused. The loss this man sustained in his cattle and hogs has surely convinced him that the person who permits tuberculosis to run its course, pays a severe penalty. It should not be necessary for every farmer to have this expense before he takes steps to eradicate this disease from his farm.

WEED SEEDS IN FARM MANURE

Elsewhere in this issue we publish an article by Professor A. L. Stone, of the Wisconsin Experiment Station, entitled "Weed Seeds in Farm Manure". There is no question but that many of the weed seeds which cause much work and considerable expense find their way to the fields through manure. The way to destroy these seeds is through placing the manure in large, deep piles and permitting it to stand for eight weeks. In making such piles provision should be made to prevent the loss of fertility.

It is very noticeable that on a majority of our farms little or no attention is paid to saving the fertility in the barnyard or to where the manure is piled. It is not uncommon to find manure close to the barn where the drippings from the eaves fall upon it, and that, together with the rains, will carry away in a short time at least one-half of the plant food in the manure. Not only does the fertility escape through leaching, but by not mixing the horse manure with cow manure. Horse manure piled separately heats to a very high temperature and nitrogen escapes. The ammonia gas which arises is often very biting, both to the eyes and to the nose. When this condition obtains, the farmer may well know that nitrogen is being lost. If horse manure is piled separately, it should be kept moist in order to prevent undue fermentation, or "fire-fanging" as it is termed. Using too much water will create heavy losses, as has been stated. But, as Professor Stone points out, if manure has noxious weed seeds in it, the best way is to place it in piles so that it can ferment and heat, and in this way destroy the germination of the seed.

For years we have advocated hauling the manure direct from the barn to the fields whenever it is possible. It is less work to handle the manure in this way and it conserves a larger amount of the fertility. But if the manure has weed seeds, storing in piles for two months is an effective way of destroying them. The losses, however, which are apt to come by this practice are heavy unless provision is made to prevent leaching and undue fermentation. In many ways it is the choice between two evils, and except where the feed is known to contain noxious weed seeds we would prefer the practice of daily hauling of manure. If the other procedure is adopted, compliance with Professor Stone's suggestion as to proper storage should be followed in order to avoid fertility losses that may be quite as large and as costly as the control of weeds resulting from the unfermented manure.

HAS ANOTHER VIEW

Elsewhere in this issue we publish a communication from Mr. J. S. Abbott, Secretary of the Institute of Independent Margarine Manufacturers, and under the caption, "Has Another View". He takes exception to a statement made in our Washington letter published in the issue of July 16th, page 1517. The statement was: "Mr. Abbott's address before the Interstate Cottonseed Crushers' Association was an appeal for vigorous and concerted action against the butter industry."

Mr. Abbott apparently forgets that in his address he said: "They differ, however, in one fundamental particular from the purpose of that giant organization (Referring to the National Dairy Union,—Eds.), whose product is in competition with margarine. It appears that the chief purpose of that organization is to kill outright the margarine industry, and to kill it, not by clean competition but by methods pursued in the spirit of an attempt to kill it by vicious prohibitory laws, and other tricks of commercial knavery, such as the boycott, false doctrines of economics, and misrepresentation of the facts of nutrition."

He also states that the present law is a prohibitory law and then follows by this statement: "Only a few years ago there was only one pound of margarine to ten pounds of butter consumed in the United States. Today there is consumed one pound of margarine to every two and one-half pounds of butter." An increased consumption of from one pound of margaine to ten pounds of butter to two and one-half pounds of butter to one of margarine, does not make it appear that the present law, which taxes oleomargarine 10c when colored in semblance of yellow butter, as being in any way prohibitory.

Oleomargarine sold in its natural color, which is white, is taxed only one-fourth cent per pound. The ten-cent tax on oleomargarine was placed on colored margarine in order to drive out deception and fraud. The oleomargarine manufacturer desires the privilege of coloring oleomargarine in order that he may sell his products as butter. The tax of 10 cents per pound was levied on colored oleomargarine to prevent counterfeiting. Further, yellow is the trade-mark of butter and we do not believe a so-called substitute is entitled to use this trade-mark.

Mr. C. H. Thom, the first dairy and food commissioner of Wisconsin, epitomized the reason for asking a tax of 10c per pound to be placed upon colored oleomargarine as follows: "No corner of the state is too remote for the presence of fraud. No table so humble; no dining room so grand; no lumber camp so rough that oleomargarine with its mellow name would not walk upon it and into it with a deceitful and brazen smile with the claim that its name is butter."

The motive of the present law was to tax the fraud out of oleomargarine and to force it to sell upon its own merits and in competition with butter. Mr. Abbott speaks of oleomargarine as a competitive product of butter. It is not a competitive product when it sells as butter and this was a common practice in the days before the law was passed, levying a tax of 10 cents a pound on colored oleomargarine and one-fourth cent on uncolored. Where substitution is possible, competition is impossible.

PESSIMISM VS. THINKING

There is an unfortunate amount of complaining about conditions on dairy farms. Too many have fallen in the habit of discontent and chronic carping. By their lamentations they magnify the real and the imagined difficulties confronting dairying. No one can doubt that the situation in many sections could be improved, but fault finding is a poor improver. Disgruntled, purposeless pessimism never raised milk prices or cut down the expenses of production. It's another kind of thinking that gets us over the rough places. If things aren't right with a man he does well to get active in righting them. Leaning back on a milk stool and wailing about prices and conditions doesn't help anyone. Folks love optimism. They thrive on good cheer. It puts them in a mood to do things. Pessimism doesn't.

Every time we hear one of these fellows who says there's no money in cows—that every pound of milk produced nets a loss and the dairy industry is doomed, we want to tell about E. P. Riford.

E. P. Riford lives in Vermont on a typical farm, pretty much on the slant and composed mostly of road-building material. At the best, making a living on it isn't easy sledding. Seven years ago he had a herd of cows, very limited capital, and a fair chance to "get on". Then a calamity befell him. An accident took the fingers off his right hand. He had a family of small children to provide for, a farm adapted to little else than the keeping of cows, and the cows ready for milking, but he couldn't milk them.

He made the best of available help and tackled the job of running the farm. For awhile he milked as many as eleven cows—with his left hand. But he was soon squarely against a choice between two things—buying a milking machine or quitting. He wouldn't quit; he had too much courage and too much faith in dairying for that, so the milking machine was installed.

That was nearly seven years ago. During this time the machine has made it possible for Mr. Riford to milk his herd of 20 to 22 cows alone. He says it is now in as good condition as when he purchased it, that it has never spoiled an udder, and that it has saved the expense of a hired man. He says that to be successful with a mechanical milker requires knowing more about the cows than for hand milking, that the milker must know how to fit the teat cups, be careful to strip clean, and keep the machine in the best of running order. He has found it satisfactory to wash the machine with water containing washing powder and keep the tubes in clean water.

Just when Mr. Riford was making good progress in spite of his first misfortune, another struck him. He had his herd tested for tuberculosis and found twenty-eight head diseased. He tested again in six months and lost seven more. Out of seven calves too young to inoculate at the first test, the six oldest went with the second. Out of his herd which he had spent many years in building, he was left with two cows and a bull calf.

But he didn't give up or even complain of hard luck. He set out at once to get together a new herd. He made the barn less apt to promote the spread of disease by remodeling to provide plenty of light, cement floors, and clean stalls. Now he has a milking herd of 21 cows including two-year-olds producing more than the former herd did as mature cows. His testing association record shows one has made 161 lbs. of fat in four months and in a recent month four were in the forty-pound list.

We talked with Mr. Riford a few weeks ago as he showed us through his barn. He thinks the relation of costs to returns ought to favor the producer a little more, but he doesn't spend much time complaining. He puts his efforts into increasing the efficiency of his own work. As we contemplate the advantages most dairy farmers enjoy as com-

pared to this optimistic Vermonter, we wonder if the story of his difficulties may not make those of others seem small. Every time we hear a man lamenting present day conditions, we want to tell him about E. P. Riford.

Peas for Hay

Will you please advise me as to the proper time to cut my peas as I wish to use them for hay? Also, can they be fed alone or shall I mix them with clover and timothy?

Pembine, Wis. H. G.

Field peas when grown alone for hay are cut when most of the pods are well formed. When seeding in mixtures with grain, the time of cutting is governed to a considerable extent by the maturity of the grain. If the peas are allowed to stand until the pods are fully formed, the grain may be so ripe as to produce a very strawy hay. In the combined crop, it is ordinarily cut when the oats are in the early milk stage and the peas are commencing to pod.

The pea hay may be fed alone just as clover or any other legume hay is fed.

Succulence Stimulates Secretion

HOARD'S DAIRYMAN:—In selecting a ration for dairy cows one of the important considerations is the provision of succulence. Succulent feeds have a very beneficial effect on milking cows and they are essential to profitable milk production. The benefits to be derived from succulent feeds are due to a considerable extent to the fact that they render the ration palatable, have a laxative and cooling effect on the cow's digestive system, and provide a part of the large amount of water required by high producing cows. Good pasture grass is the best succulence for dairy cattle and in the early part of summer it will provide all the succulent feed they require as a rule. In the latter part of summer when the pastures begin to dry up, soiling crops or silage should be used to provide additional succulence. In winter corn silage forms the most economical succulence though it can sometimes be advantageously supplemented with beet pulp or roots.

Many are feeding cows without giving attention to this problem. Some are successful, others not, but none are attaining the success they would achieve if succulent feeds were provided. Crops of a succulent character are easily and cheaply produced and the dairyman must so conduct his operations that a supply of palatable succulent feed is available for his cows throughout the year.

Iowa. A. C. MCCANDLISH.

Winter Rye and Vetch

How many cubic feet to the ton of alsike and red top hay in a small mow, 12 ft. by 22 ft. and 6 ft. deep?

In sowing winter rye and vetch how much of each would you put to the acre?

Roulette, Pa. C. S. W.

It is doubtful whether the hay mentioned will go less than 500 cubic feet to the ton and it is more likely that it will be 550 to 600 cubic feet per ton. Estimates of this character are very difficult to make and it has been our experience that estimates of hay by measure are ordinarily somewhat excessive.

The general recommendations are to sow from 20 to 25 lbs. of hairy vetch to one-half bushel of winter rye. In the state of Oregon, it is recommended to sow 20 lbs. of hairy vetch with not over 10 to 20 lbs. of rye. The basis of this recommendation is that more rye tends to smother out the vetch. This would hold particularly true if it is desired to grow a seed crop from the vetch, but if it is to be used for pasture or for hay, it is quite likely that the previous recommendation will prove quite as satisfactory.

In New York State, they have adopted a system of adding 10 lbs. of hairy vetch to the usual spring seeding of oats, timothy, and clover. The purpose of this is to supply additional value to the oats when cut as hay and also provide a somewhat quicker growing legume crop than the clover itself.

Feed Values Compared

I have to buy feed for my pigs. Shelled corn here is worth $2 per bushel. On that basis what are the following feeds worth per cwt.: Barley, oats, tankage, skimmilk, buttermilk, whey, and middlings.

Camden, Mich. J. A. P.

It is very difficult to place comparable valuations upon a number of feeds. This is true because different feeds fill various needs in the cow's rations. Also the value to a feeder depends upon what he needs, that is, if he is short of protein a high protein feed may be very much more valuable than another feed which is high in carbohydrate value but low in protein.

We have taken the several feeds listed and figured their values on the basis of their total digestible nutrients, that is, the sum of protein and carbohydrates plus the fat multiplied by 2.25. On this basis we figure that when corn is worth $2 per bushel, barley has a value of about $3.25 per hundred pounds, oats $3, tankage $3.40, middlings $3.20, skimmilk $1, buttermilk $1, and whey $.50.

Perhaps tankage is a good illustration of the fact that feeds cannot always be purchased on their total digestible nutrients. If tankage is needed in the feeding of pigs, it is protein which is sought. The high protein content of this feed may give it a valuation out of proportion to that on the basis of its total digestible nutrients.

When we value buttermilk at $1 per hundred pounds, that is, equal to skimmilk, we have in mind the undiluted product from a creamery where care is taken to see that the buttermilk is clean and of uniform quality from day to day.

Threshing Time Fires

The golden grain in stacks represents the year's product of the soil and the season's effort and labor of the farmer, his family, and hired help.

The crops throughout the state are bountiful. Shall they be safeguarded against fire, and saved for their intended use of food and feed for man and beast?

Over $50,000 worth of grain in stacks was destroyed by fires caused by threshing engines last year in Wisconsin. There was a further considerable loss on buildings and straw stacks from this cause.

A few simple, inexpensive precautions will insure the safety of your grain stacks.

Clean up and remove all dry grass, weeds, and other combustible materials from the yard in which grain is to be stacked.

On the principle of not putting "all your eggs in one basket" do not stack all your grain in one place, but have two or more sets of stacks.

Do not stack your grain too near buildings. A fire in the grain stacks may destroy your buildings also, or a chimney spark may set the stacks on fire.

Do not place the stacks within 200 feet from a railway track.

A plowed fire guard, of not less than six furrows, around each set of stacks will protect the stacks against running fires.

Smoking on or around grain or straw stacks should not be permitted.

See that the threshing engine smoke stack is equipped with a good, effective spark arrester.

Every threshing crew should carry along two or more approved chemical fire extinguishers to combat incipient fires.

Farmers should place near each set of stacks some barrels filled with water and a few pails.

The engineer should be required to keep all oily waste in metal receptacles.

Do not hazard the product on which you have spent months of care and labor.—Wisconsin Industrial Commission.

Horses in Hot Weather

The following rules for the care of work horses in hot weather were prepared by the Boston Work-Horse Relief Association:

1. A sponge on top of the head, or even a cloth is good if kept wet. If dry it is worse than nothing.

2. Water your horse as often as possible. So long as a horse is working, water in small quantities will not hurt him. But let him drink only a few swallows if he is going to stand still.

3. When he comes in after work, sponge off the harness marks and sweat, his eyes, his nose and mouth, and the dock. Wash his feet but not his legs.

4. If the thermometer is 75 degrees or higher, wipe him all over with a damp sponge, using vinegar water if possible. Do not wash the horse at night.

5. Saturday night, give a bran mash, lukewarm; add a tablespoon of saltpetre.

6. Watch your horse. If he stops sweating suddenly, or if he breathes short and quick, or if his ears droop, or if he stands with his legs braced sideways, he is in danger of a heat or sun stroke and needs attention at once.

7. If the horse is overcome by heat, get him into the shade, remove harness and bridle, wash out his mouth, sponge him all over, shower his legs, and give him two ounces of aromatic spirits of ammonia, or two ounces of sweet spirits of nitre, in a pint of water; or give him a pint of coffee, warm. Cool his head at once, using cold water, or, if necessary, chopped ice, wrapped in a cloth.

8. If the horse is off his feed, try him with two quarts of oats mixed with bran, and a little water; and add a little salt or sugar. Or give him oat meal gruel or barley water to drink.

9. Clean your horse at night, so that he can rest well, and clean him thoroughly. The salt dandruff drying on his skin makes him uncomfortable, and often produces sores under the harness.

10. Do not fail to water him at night after he has eaten his hay. If you don't he will be thirsty all night.

11. If it is so hot that the horse sweats in the stable at night, tie him outside, with bedding under him. Unless he cools off during the night, he cannot well stand the next day's heat.

Handling Help on a Big Dairy Farm

An Interview by Mr. Crooker with the Manager

"The thing about our method of handling help which makes it different from that followed on many big dairy farms is that when our men are through work they are done. This statement, probably, needs amplification in order to bring out the point which it seeks to emphasize. On the average farm the work is never done. After a day in the field there are usually enough 'chores' and 'odds and ends' to look after to keep everyone going until sheer weariness compels them to tumble into bed. No wonder farm help has drifted to the cities where a regular time schedule prevails in the trades. When such conditions prevail on a farm similar to ours it is due, I think, almost entirely to a lack of systematic plan." Thus spoke the manager of a large dairy farm in northern Illinois.

"We divide our help, as is usually done on big farms of this kind, into two classes," he went on. "There are field men and barn men. Our inflexible rule, however, is that the barn men shall never work in the field and the field men shall never work in the barn. Occasionally, of course, we are obliged to shift a man from one class to the other, but it is understood that if a barn man should go on field work he is to keep a field man's hours and busy himself solely with field men's tasks. The rule works both ways. The barn men get up at four o'clock; the field men sleep until five. The former begin work a bit earlier, you see, but they are apt to have a longer breathing spell at noon. Between the morning and evening periods of barn work they expect to do light work of various kinds about the place such as mowing lawns in summer, repair jobs, and so on. They are never sent to the field, however, 'to help out' between their regular duties. Some seasons it is difficult to find enough to keep them more than partially busy through the middle of the day. But they get up earlier, you see. It all averages up.

"Another thing we insist on is that work shall be finished promptly by half past five o'clock. The field men usually get in a little before this time. When they have put away their teams it is 'quitting time' and their day's work is done. The barn men start milking sufficiently early so that 5:30 o'clock sees everything out of the way. They, too, are then done for the day. Every man's time after he is done is his own until next morning. Not long ago there were five of my men who had 'flivers' or other cars in the farm garage. Their evenings were enjoyed as freely as though they had been mechanics who laid down their tools at the sound of the whistle.

"In regard to time off, it is our custom to give men one full day a month—more at seasons when we can spare them. Sometimes a man gets a full week if farm work is slack. This last year I have been promising men who stay through the season a bonus of $5 for each month they remain with us. This bonus is forfeited, of course, if men leave before the season's work is finished. Now and then, in the case of especially faithful or capable workers, I have surprised them by doubling this amount when I came to pay them. I find it pays to be generous and square with the men, provided one holds a firm hand. And I find it true, also, that they will enter into the spirit of the work with more zest if they know they have regular duties and regular hours."

Demonstration Days in Central Wisconsin

An attendance of over two thousand people coming from half a dozen counties in Central Wisconsin represents the high-water mark for Farmers' Week at the Marshfield Experiment Station. The session started July 27 and closed July 29. The first day was given over to Taylor and Clark Counties, the second to Wood, and the third to Marathon. Mr. R. A. Kolb and H. Knipfel had in charge the delegations from Clark and Taylor; R. A. Peterson, Wood; and Frank Swoboda, Marathon County. A dozen or more speakers, experts in their line, took part in the program. The meetings were opened by Mr. F. L. Musbach, in charge of the station, who welcomed the visitors and extended to them every facility to get information and assistance. He referred to the increasing interest on the part of the farmers in the work the station is doing. Eight years ago a one-day session with about 75 in attendance to a three-day course with 2,000 people, some of them coming from distances of 75 to 80 miles, gives some idea of the interest manifested and the co-operation existing between the farmers and the local station. It is only through such effort and interest that the station can be of greatest service to the farming community of Central Wisconsin.

The station now embraces a tract of 180 acres, three-fourths of which is under cultivation. The greater part of this is yet in demonstration tracts. As funds permit, more land will be devoted to experimental work in taking up new problems in soil management and grain testing work that are now pressing for attention.

Mrs. Nellie Kedzie Jones assisted by Miss Brady and Miss Maloche had charge of the women's program. Mrs. Jones in her talks urged the better care and feeding of the children in the farm home. She stated that a quarter of a million of boys and girls under two years of age died the past years because the mothers were not informed as to the best food and care for the little ones. The home demonstration agent, she emphasized, is one of the means of bringing information into the homes that will assist the mothers in the better selection of foods and care of children.

Miss Maloche and Miss Brady demonstrated in a practical way the use of modern appliances, the making over of garments, and household accounts.

Editor Glover of Hoard's Dairyman who is president of the State Dairy Council, emphasized the value of milk as human food. The growing child he said should have at least a quart of milk and the adult a pint a day for health's sake. A properly nourished body is much more disease-resistant than one under-nourished. Only one child out of six going to the country schools receives milk to drink.

He urged the support of the Wisconsin Dairy Council, an organization whose prime purpose is to tell the people of this state and others the value of our milk product, stating that in comparison with the prices of other foodstuffs milk is considered a very economical food.

Edward Nordman, farmer for 37 years and now director of the Division of Markets, spoke briefly of the relation of the farmer to the experiment station and also of the newly created Division of Markets. He urged the farmers to bring their problems to the experiment station for assistance in their solution. One of the important problems confronting the farmer in Central Wisconsin is how to get clover back into the soil.

"The Division of Markets," stated Mr. Nordman, "is interested in shortening the route from the producer to the consumer. This doesn't mean cutting out the middleman entirely, but making it as easy as possible to deliver the products of the farmer to the city consumer." The marketing division also aims to help the farmers in forming co-operative organizations in order to help to get better prices for the farmers' products.

Mr. F. B. Morrison discussed at length the cheaper production of pork. Four trial lots are maintained at the station in which various pastures including oats, peas, rape, and clover are being tried out. The results of this line of work will soon be published in pamphlet form.

The important part of the program in the afternoon for the farmers was given over to the inspection of crops. Mr. E. J. Delwiche, agronomist for the station, gave the results of his work in the tests he has been pursuing in the growing of grains. In oats the 5 best yielders include the Wisconsin Pedigree Nos. 1, 4, 5, 7, and the variety known as Lincoln oats. These average between 50 to 55 bushels per acre for the past five years. Winter wheat has been found a more dependable crop than spring wheat on the Colby silt loam. Pedigree No. 2 and Bascsa No. 408 average for the past three years from 26 to 30 bushels per acre. Winter rye is also a crop recommended for Central Wisconsin. Failures are practically unknown. Pedigree No. 1 and No. 1219 are two of the best varieties tested out.

Much of the Colby silt loam requires not only surface drainage but also under-drainage in order to get the maximum yields. The results of tiling were explained by Mr. L. F. Musbach and the improvement of the yield in crops due to under-drainage shown. The studies thus far show that this type of soil may be drained but that the lines of tile must be nearer than four rods apart in order to get the best results. Another set of plots is devoted to plowing at various depths and the use of a subsoiler and deep tiller. During the past seven years little if any benefits have been derived from deep tillage methods. All things considered, plowing to a depth of 6 to 6½ inches is the practice recommended.

The detrimental effect of acid soils is becoming more noticeable the longer the land is under crop. The effect of liming has been found not only beneficial in getting better stands of clover but also in improving the yields of other crops in the rotation.

Phosphate fertilizers are showing good results in not only increasing the yields but also in hastening the maturity of the corn crop.

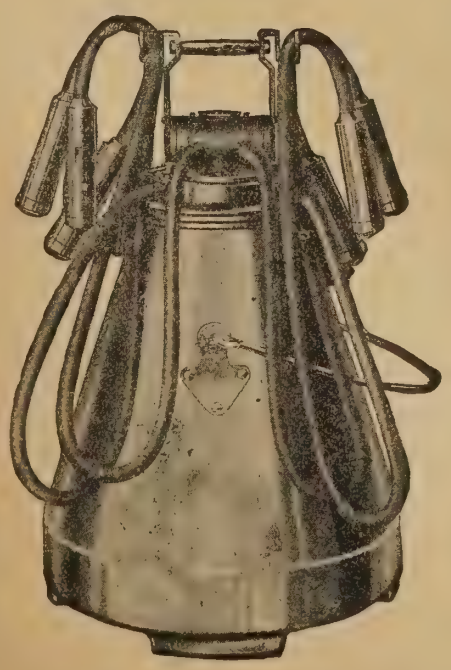
The young folks program was in charge of E. Cooper, E. Stokdyk, and J. Taylor. The program included the visiting of the experimental plots viewing the different varieties of grains grown and the effects of different soil treatments. Games and sports concluded the program for the young folks.

It is very encouraging to the men and women who are devoting their time to this type of instruction to see the great interest displayed by the visitors in the very strenuous program arranged for them. No longer can the meetings be called "Farmers' Picnics" for there is only time for a hurried lunch and greeting of friends. They are now truly demonstration days.

Wisconsin. SUBSCRIBER.

A tireless worker is the tile drain. Day and night, while the ground is wet, it keeps at its job and asks no pay nor feed.

MILK



Increasing In Favor As a Beverage

Men are patronizing the soda fountains in increasing numbers since prohibition went into effect. Their preference, in many instances, is for milk

This greater demand for milk spells greater "opportunity" for the dairyman—absolute assurance that the market will take every quart he produces.

Dairymen, awake to their own interests, are increasing their herds and adding milking machines to their equipment.

The milking machine enables one person to milk three times as many cows as he can milk by hand.. Milking machines that assure the highest grade of milk are equipped with

WEAR-EVER
ALUMINUM
TRADE MARK

The ear for the bail on the "Wear-Ever" Pail is so constructed that the bail cannot possibly fall flat against the side of the pail. As a result the bail is always held about an inch away from the side insuring a quick and easy grip.

"Wear-Ever"

Aluminum Milk Pails

The **"Wear-Ever"** pail is made *Seamless* from solid sheet aluminum. No crevices in which bacteria can lodge. *Cannot Rust*—Cannot chip.

"Wear-Ever" Aluminum Pails are easy to keep clean, are light in weight, durable; need no tinning.

Made of the same metal and in the same factory and bear the same trademark as the millions of **"Wear-Ever"** aluminum cooking utensils used in American homes.

The Aluminum Cooking Utensil Company
New Kensington, Pa.

In Canada "Wear-Ever" utensils are made by Northern Aluminum Company, Limited, Toronto, Ont.

TABER LINED SILO

"LINED" (Pat. App. for) Acid-Proof Lining keeps air out—and moisture and juices of corn away from staves. Prevents rot—freezing and spoilage.

Shipped in 24 Hours

Made of *absolutely clear* Long Leaf Yellow Pine boiled in Creosote. Acid-Proof Lined, Painted outside, Double Anchored. Won't blow down.

Non-Shrinkable

Rot-Proof Acid-Proof No shrinking or swelling of staves. No frozen silage. Finest circle doors and frame.

FREE BOOK (just out) on Silos and Silage. *Write for it Today!*

TABER LUMBER CO.
1204 Main St. Keokuk, Ia.

Est. 1855

25 Cords a Day

Easily Sawed By One Man.
Easy to move from cut to cut. Make big profits cutting wood. Cheap and easy to operate.

OTTAWA LOG SAW

Does 10 men's work at one-tenth the cost. Makes work easy. Engine can also be used for running pumps and other machinery. Saw blade easily removed. Write for our low price.
Cash or Easy Payments.

30 Day Trial
10-Year Guarantee

Ottawa Mfg. Co.
1389 Wood St.
Ottawa, Kansas.

Kill All Flies! THEY SPREAD DISEASE

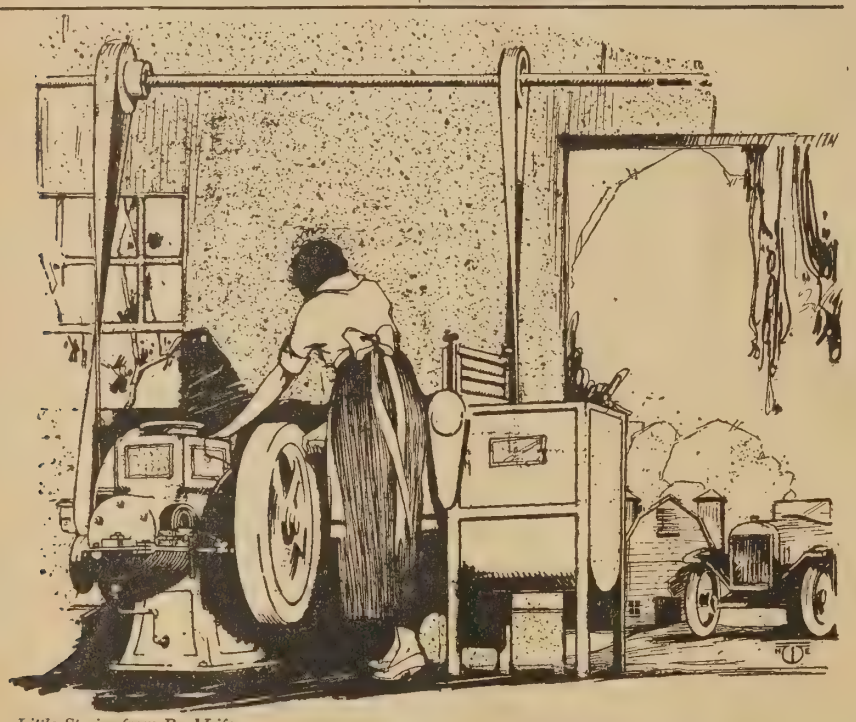
Placed anywhere, DAISY FLY KILLER attracts and kills all flies. Neat, clean, ornamental, convenient and cheap. Lasts all season. Made of metal, can't spill or tip over; will not soil or injure anything. Guaranteed.

DAISY FLY KILLER at your dealer or 5 by EXPRESS, prepaid, $1.25.
HAROLD SOMERS, 150 De Kalb Ave., Brooklyn, N. Y.

Treat All Seeds

Take no chances. Smut is a common disease which usually decreases the yield of grain as much as 20%. *Formaldehyde* is endorsed by the U. S. Department of Agriculture as the standard treatment of seed grain, to prevent smuts, fungus growth, potato scab and black-leg.

FORMALDEHYDE
The Farmer's Friend



Insures a full yield because it destroys all forms of smuts and checks all plant diseases known to affect grain crops. Can be used also on the soil. One pint bottle of *Formaldehyde*—from the Laboratories of the Perth Amboy Chemical Works—treats 40 bushels of seed. New hand-book just issued free.

Perth Amboy Chemical Works
709-717 SIXTH AVENUE NEW YORK

Dickey Glazed Tile Silos

Best of materials, six different diameters, everlasting hollow tile roof, easiest to build—such features as these have made the Dickey pre-eminent among silos.

California Dairy Council Meets

(Continued from first page.)

consumption of milk, and the figures revealed the startling fact that in every age, without exception, the milk-using children were taller and weighed more than the non-milk-using children. It was also found that the milk-using children made more rapid progress in their studies. In every grade the milk-using children were slightly younger than the non-milk-using children. The milk-using children gained on the average 2.28 years on the non-milk-using children, from the kindergarten to the eighth grade. Dr. Beach stated further that practically all of the winners of the school athletic contests received milk regularly in their diet. He stated it was his experience that the boys and girls who showed lack of inclination to engage in the more strenuous games, such as base ball, basket ball, tennis, etc., admitted under questioning that they did not receive milk.

Dr. Beach accompanied his talk with illustrative picture slides. His address was very impressive, and he pleaded for a more active interest on the part of the dairying industry in the work of educating people throughout the entire country on the importance of a more liberal use of milk, butter, cheese, and ice cream, for their own health and the welfare of their children.

Dr. Ethel M. Watters, Director Bureau of Child Hygiene, State Board of Health, told the audience the place of milk in the diet of childhood. She explained the work of the Bureau in a graphic and entertaining manner. Her hearers were surprised to learn that representatives of the Bureau who go into rural districts spreading the gospel of hygiene and nutrition find a large proportion of undernourished young children and a pitiful lack of knowledge of the food value of dairy products on the part of producers.

In the discussion of her topic Dr. Watters revealed most clearly the necessity for the existence of some organization or group of people that will persistently carry on a campaign of educational publicity concerning the nutrition value of milk and other dairy products. The uniform ignorance on the part of mothers, disclosed by Dr. Watters, is almost unbelievable. She praised the work of the California Dairy Council and urged that it be given wider and more liberal support in order that its usefulness may be rapidly extended.

The Dairyman's Big Opportunity

The second day's program was given at the county fair grounds. It opened with a practical and convincing paper on feeding dairy cows for profit by Professor Edwin C. Voorhies, assistant to Dean Hunt of the College of Agriculture. Professor Voorhies began by saying that he would not make a technical or scientific address, but would endeavor to give a practical talk on feeding. The applause at the close gave evidence that the large audience heartily appreciated his effort. Professor Voorhies took up the practice of feeding straight alfalfa and showed in a practical way how the production of cows could be increased by reducing the amount of alfalfa, and feeding silage, concentrates, and roots, according to relative costs and local conditions.

One of the most educational and interesting features of the entire program was the address of Professor H. E. Van Norman, Dean and Vice-president of University Farm School, Davis. Dean Van Norman began his talk with a forceful presentation of the opportunity with which the dairymen of the country are confronted in the discoveries of science of the vital part which dairy products play in the health and welfare of the nation. He asserted that no industry has right at its elbow such marvelous material as the dairying industry, and predicted that there would be such a demand for dairy products within the next few years as would strain the resources of the industry provided those who are engaged in it will seize the opportunity at hand and educate the consuming public to realize the truths that science has discovered.

After driving home this point he turned to the magnificent dairy cows which had been brought in and gave the finest demonstration of cow judging that was ever offered in Kings County. His audience followed his every word and description. It is to be hoped that more talks of this kind will be given to the dairymen throughout the state.

Dr. J. P. Iverson delivered a helpful and instructive paper on the best methods for the eradication of tuberculosis in dairy cows. His address was followed very closely and brought immediate fruit in the decision of the Dairymen's Department of Kings County Farm Bureau to at once commence a campaign for the eradication of this disease from the herds of the county.

For the benefit of the large number of Portuguese people, the entire program was summed in an address by Mr. J. P. Mendonza in the Portuguese language. Mr. Mendonza aroused great enthusiasm and obtained a vociferous endorsement of the work of California Dairy Council and a pledge that the Portuguese dairymen would support it in all its efforts.

The barbecue proved to be a big attraction and a great success. Fifteen hundred people were served in an hour and a half without a hitch. Milk, buttermilk, and ice cream were provided in generous quantities by the creameries and dairies of Hanford and vicinity. Costa's Boys' Band discoursed lively music during the barbecue and between numbers on the program.

Calves Auctioned

One of the most interesting features of the day was the auction sale of three pure-bred dairy calves that had been presented to the Council. C. M. Blowers Company presented a four-week-old great grandson of Tilly Alcartra. The bidding was spirited and the calf was finally purchased by two of the directors of the council for a high school boys' calf club in Sonoma County. A. B. Comfort donated a seven-month-old bull of the famous King Riverside Mead strain, and Sperry Flour Company bid him in at $250. The purchaser retained possession of the calf just long enough to name him "Suremilk" and turned him back to the auctioneer for re-sale. He was knocked down for the second time to Shore Acres Dairy, San Leandro, at $350. During the second sale H. E. Vogel of Fresno offered the successful bidder a three-week-old calf free. Sperry Flour Company added a ton of Suremilk and A. J. Quist, Caruthers, a ton of alfalfa hay, baled. Mr. Wesley G. Clark gave a three-week-old calf of equally good breeding. This animal brought $160, and also went to the Sonoma County Boys' Calf Club.

"A single glowing cigarette stub," says Secretary Meredith, "may cost the government thousands of dollars for fire fighting, to say nothing of the value of the timber destroyed, the desolation of scenic beauty, and the harm done to water flows."

Rotate the sheep pasture in the summer; don't allow lambs to run on old pasture; put them on green forage if you have it and new pasture is not available.

From actual photograph, taken in The Edison Shop, Fifth Avenue, New York City. Standing next to the New Edison, Mr. Albert Spalding, America's greatest violinist. Behind the screen, Mr. Cecil Burleigh, the eminent American composer; Mr. Berton Braley, the poet and song-writer, and Mr. Henry Hadley, who wrote the opera, "Cleopatra's Night."

Do You Know Any Violins?

YOU quickly recognize a friend by his voice. Just as quickly a musician recognizes the voice of a violin he knows.

Every good violin has a tone-quality that makes it different from every other violin. The fundamental violin tone is given an individuality by minute differences in the over-tones.

This tone individuality is inherent in the instrument itself; it is independent of the player; it gives each fine violin something that in human beings we call "personality."

RE-CREATION of Tone Characteristics

The New Edison's success in RE-CREATING these over-tones prompted the interesting test, pictured above.

We wanted to know if, to the super-critical ears of experts, the New Edison RE-CREATED, not only the fundamental violin tone and the artist's execution, but also the individual tone characteristics of a violin, so fully and absolutely, that those who knew the instrument would immediately recognize its voice by its RE-CREATION.

Test Against a Guarnerius

The test was made in the Recital Hall of The Edison Shop, Fifth Avenue, New York, just before Mr. Spalding sailed for his tour of Europe and South America. Spalding played his Guarnerius in direct comparison with one of his New Edison RE-CREATIONS.

This Guarnerius is a rare, old, highly treasured violin, noted for its brilliant, joyous, singing tone. Experts have valued it in five figures.

How the Test Was Made

Behind a screen were Henry Hadley, whose opera, "Cleopatra's Night", was performed last season at the Metropolitan; Cecil Burleigh, one of the best of American composers, and Berton Braley, who has written many song lyrics. They could not see either Spalding or the New Edison. Their judgment was formed from the only positive musical evidence—sound.

Mr. Spalding stood beside the New Edison and played a selection. Suddenly he lifted his bow. The New Edison took up his performance and continued it alone. Thus they alternated, Mr. Spalding and the New Edison.

The test ended. The experts of the jury were asked two questions: First, if they could detect any difference between Spalding's technique and its RE-CREATION. Second, if they could note any difference between the tone-quality of his Guarnerius and its RE-CREATION.

Decision of the Jury

Unanimously, they declared that they could not. The New Edison, they agreed, RE-CREATED absolutely, not only the individuality of Spalding's art, but also every tone-quality of his wonderful Guarnerius. The New Edison gives *everything* that Spalding gives with his great Guarnerius.

Mr. Edison has spent more than three million dollars in perfecting the New Edison to a point where it will RE-CREATE even the subtle tone-qualities that distinguish one violin from another. After a thorough investigation, we believe that the New Edison is the only instrument capable of sustaining this test.

The "Two-Violin" Test

Your local dealer will gladly give you the interesting "Two-Violin" Test described on this page. It will enable you to determine the New Edison's Realism for yourself. Ask for it. Thomas A. Edison, Inc., Orange, N. J.

A Test You Can Make

The "Two-Violin" Test

Albert Spalding, with his brilliant, joyous, singing Guarnerius, has made a RE-CREATION of an "Ave Maria" for the New Edison. Carl Flesch, Europe's greatest violinist, has also made a RE-CREATION of an "Ave Maria" for the New Edison. His violin is a Stradivarius, rich, profound and mellow in tone.

Go to your Edison dealer and let him play these two "Ave Maria" RE-CREATIONS for you. Ask for the "Two-Violin" Test. Contrast the tone of the RE-CREATED Guarnerius against the tone of the RE-CREATED Stradivarius. See whether the New Edison brings out the subtle distinctions between them. Get acquainted with these two famous violins.

"The Phonograph with a Soul"

POSITIONS WANTED

Married man, no children, wants position as herdsman. State wages. FRED ROSE, 1808 Adams St., Toledo, Ohio.

Position wanted by married man on stock or dairy farm, north preferred, college training, practical farmer and dairyman. Open for position Jan. 1st. Address BOX 305, care Hoard's Dairyman.

Manager, 36 years old, graduate agricultural college, thoroughly experienced in general farming, stock raising, A. R. O. work, soil development, drainage, building construction, handling of men, wants position. No proposition too large. Write BOX 302, care Hoard's Dairyman. 4-3

Here is farm help. Have you a winter string of cows to let on percentage basis or would you hire? Look me up. Address BOX 303, care Hoard's Dairyman.

Position wanted on farm. Dry hand milker. Prefer place where could become part owner in near future, but will hire by month. Married, no children. State wages first letter. H. F. HARRIS, R. 2, Long Lane, Mo.

Expert herdsman, married, desires position October 1. Cornell training, 12 years' experience. Address BOX 313, care Hoard's Dairyman.

Position wanted—By practical dairyman and farmer with family. No small children. Can handle farm and dairy without other help. Am in position to change at once. Best of reference. Address BOX 103, Granger, Iowa.

Would like to hear from S. B. C., Ohio, regarding a position that is open on this farm. MERRYGLADE FARM, Somerset, Pa.

County agent with years of farm experience desires farm management position in Eastern United States by the first of the year. Address BOX 310, care Hoard's Dairyman.

Wanted by graduate veterinarian. Position on good stock farm to look after health and general welfare of animals. Also look after advertising and sales end. Address BOX 309, care Hoard's Dairyman.

Wanted—Position on modern dairy farm. Am experienced in feeding, the production of certified milk, Babcock testing, pasteurizing, mechanical milkers and mechanical refrigeration. Single, age 32. Prefer Eastern states. E. KNOLLIN, Kennett Square, Chester County, Pa.

Wanted Position—As working manager or herdsman. A-1 farmer, dairyman, feeding for short or long time tests. Expert calfman. Run all farm machinery, keep same in repair, 30 years, married. Address BOX 315, care Hoard's Dairyman.

(Continued on page 133)

New York Butter Market

NEW YORK CITY, August 3—The foreign butter which was received during the winter and early spring months invariably reached this market at an opportune time. Had it not been for the arrival of four million pounds of Danish butter at the time of the railroad strike in April, there would have been a marked shortage in the butter supply at that time, and prices would undoubtedly have gone even higher than they did. However, the same can not be said of the last large imports of butter which arrived here about two weeks ago. The result of the arrival of that butter is an almost panicky market. Receivers are extremely nervous and there is very good reason for them being in a pessimistic frame of mind. To begin, the Danish and Holland butter is not being absorbed readily, as it is estimated that fully 50 per cent of it remains as yet unsold. Holders of it are attempting to force sales, as it is tying up large sums of money. To do so they are willing to shade prices to a considerable degree. To add to the unsettled condition, domestic production shows very little seasonal decrease. Receipts of butter in this market ran about 9000 packages higher during the past week than for the same week last year. Because of the uniformly cool weather throughout the butter producing sections, the fly nuisance is not so bad as usual at this time of the year and pastures are holding up remarkably well. There is a feeling that there will be an unprecedented butter production in this country during the coming months.

The tightness of money is also a factor that is injuring the butter market. Always at times of over supply, especially at this time of the year, receivers place large quantities of their accumulated butter in storage warehouses and depend on their banks to help them finance their holdings. While many receivers have been forced to put some of their butter in storages, they are finding it difficult to do so because of their inability to get money to finance them. Practically all banks are asking 8 per cent on money loaned on storage holdings. That condition makes receivers very careful, in view of the fact that with a large fall production certain, there is a possibility that butter prices may be lower during the fall months than at the present time. For that reason, dealers are urgent sellers and continue to shade prices. On the other hand, buyers have things their own way and are purchasing very sparingly. The present outlook is far from satisfactory and receivers are operating very carefully. It is very probable that butter prices will be at a lower level during the coming year than they have been for some time.

With conditions as they are at present the price trend could not be otherwise than downward. There is absolutely nothing to bouy the market up. If it were apparent that production would decrease there would be a possibility that the market might recover somewhat. However, as it is, while price declines are small from day to day, the price of butter is gradually going down. The total decline since Monday of the past week has been 1¾@2c. On Monday of last week, the quotation on extras was 56c. On Tuesday, there was a decline of ½@¾c. That was followed by a further decline of ¼@½c on Wednesday. On Thursday, the market recovered to a slight degree as some unexpected speculative buying materialized. That continued on Friday and the price advanced ½c although it was generally felt that the increase in price was unjustified. On Saturday, the quotation was ½c lower, but there was no change on Monday, although the market was very weak. Today, however, there was a decline of ¾@1c, and the market is very weak. Established quotations at the close today were: Extras (92 score), 54@54¼c; higher scoring than extras (93 score or higher), 54½@55½c; firsts (90—91 score), 52½@53½c; firsts (88—89 score), 51@52c; and seconds (83—87 score), 48@50c.

Ayrshires for Export

The continuous and persistent demand of foreign countries is resulting in considerable trade. Two new exports are announced. W. H. Druckemiller, Pennsylvania, has shipped to Ponce, Porto Rico, two Ayrshire cows and two Ayrshire bull calves, the purchaser being the well known planter and exporter, Vincente Usera. Capt. A. Henry Higginson, Massachusetts, announces the sale of nine females and one male for shipment to Jorge Baretto of Brazil. The latter exportation includes daughters of such well known sires as Low Milton Iron Duke, Cavalier's Lord Roseberry, Netherhall Keystone, Hobsland Record Piece, and Baron's Best.

J. G. WATSON, Sec.

Cowpox

My cows all have sore teats. There are little warts like sores all over the teat and after a scab forms they break open and a watery-like liquid runs out. It also seems to be catching. After one has it they all get it. It seems to last about 3 weeks, then goes away and after a week or so comes again. Can you advise a remedy for this?

Giese, Minn. F. W.

Isolate affected cows and milk them last, or have them milked by one who does not handle the other cows. The infection is readily carried from cow to cow by the milker's hands. Twice daily immerse affected teats for 5 minutes in hot water containing all the boric acid it will dissolve; then dry gently and apply a little benzoated oxide of zinc ointment. If any sore is obstinate in healing apply strong iodin ointment twice daily. Cleanse, disinfect, and whitewash the stable.

BIG CROPS ASSURED IN WESTERN CANADA

Need of Farm Labor Urgently Required for Harvest

Rains of the past week, which have been general throughout all portions of Western Canada, covering **Manitoba, Saskatchewan** and **Alberta,** have placed beyond all manner of doubt the certainty of vast grain crops throughout the entire district.

Reports from all points indicate marvelous and rapid growth. The conditions of a week or so back, which were decidedly less promising and led many to think there might be a partial failure, have disappeared altogether and now there is a wave of optimism circulating throughout the entire country.

In 1915 there were enormous yields reported from all parts, and it would appear now as if in many places the yields of 1915 would be equaled if not beaten.

What might appear to be a drawback is the apparent shortage of farm help. The Province of Manitoba, through its Employment Bureau in Winnipeg, is asking for 10,000 harvest hands and over, offering from $5 to $6 per day. The Province of Saskatchewan is asking for 15,000 extra hands, to take care of the immense harvest that is certain to be reaped in that Province. In Alberta the crop area is somewhat less, the labor conditions somewhat better, and a request is being made for 5,000 extra farm hands.

Interviewing the officials of the different Governments, they are inclined to the opinion that as the crops in Kansas, Nebraska, South Dakota, Illinois and other Central States are harvested, there will be a movement northward that will materially help to take care of the labor situation. With the low railroad rates that may be secured on application to the Employment Office at Winnipeg and at boundary points, or which may be secured through the Canadian Government Offices at Chicago, Ill.; Detroit, Mich.; Milwaukee, Wis.; Kansas City, Mo.; Omaha, Neb.; Des Moines, Iowa; Watertown, S. D.; St. Paul, Minn., and Grand Forks, N. D., will give to those seeking employment the opportunity to reach the harvest fields at a low cost.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Importance to Junior Poultrymen

In the year 1882 a scientific investigator by the name of Koch discovered the deadly germ of tuberculosis, a disease which has taken thousands of lives and has cost the people of the world millions of dollars.

Human tuberculosis is one of the most dreaded diseases. It does its work so slowly and silently, that it gets a good foothold upon the patient before he is aware of it. The best way to combat this disease is by keeping ourselves fit. Plenty of fresh air, outdoor exercise, good wholesome food, and regular bedtime hours will keep you in good condition. We cannot be too careful about all of these things if we want to keep in the best health.

As important as it is for us to know about tuberculosis in people, we should also be informed about this disease as it affects other animals. Since the discovery made by Koch in 1882, tuberculosis has been a problem of constant study, and we now know that the farm stock, cattle, hogs, and poultry may easily contract this disease. Knowledge of this disease is now so extensive and means of detecting it in affected animals are so successful that there seems to be little excuse for the disease in any dairy herd.

The cause of the disease, according to the discovery in 1882, and from the work of others since that time, is a very tiny germ known as the tubercle bacillus. Outside of an animal body these germs cannot develop, but once they gain an entrance they multiply rapidly and cause little knots, nodules, or tubercles to form on various organs. For this reason the disease has always been known as tuberculosis.

Tuberculosis in Poultry

It has long been known that birds of many kinds are subject to tubercular infection. However, it is only within recent times that attention has turned to a study of tuberculosis in poultry in a practical way. It is safe to say that the poultry business has suffered severe losses in the past due to a lack of knowledge of this disease. The bacillus or germ which causes the disease in poultry is smaller than the one to which human beings are subject.

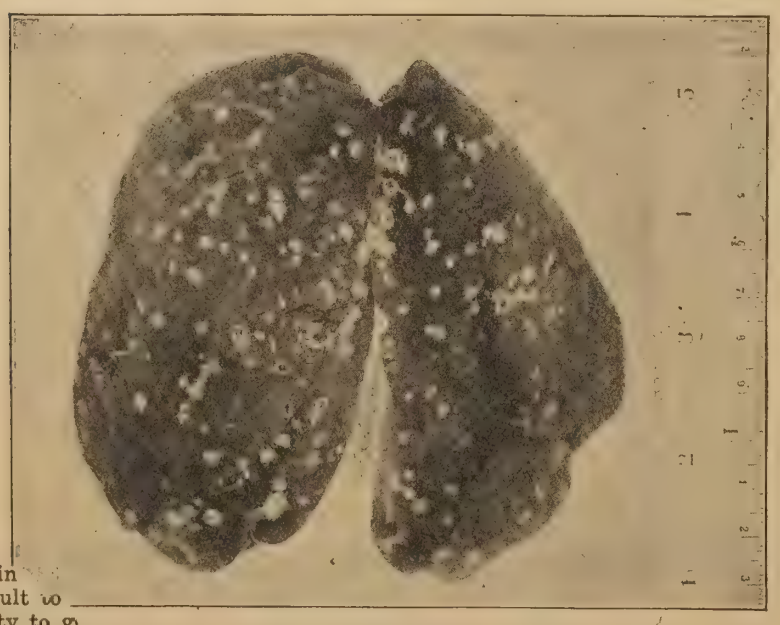
How the Disease Works

Those who have made a study of tuberculosis in poultry will tell you that the disease affects the digestive organs rather than the lungs, which is more frequently the case in man. There are usually no signs of the disease in an infected bird, until it is well along and has secured a firm grip upon the individual. Loss of flesh is probably the first indication, and in badly infected cases two-thirds of the weight may be lost. This perhaps is considered the best external evidence that the disease is present. It should at least arouse our suspicion and cause us to be on the lookout before it becomes too late.

The comb and wattles become very pale in color and sometimes lameness is present. These, of course, are all to be regarded as symptoms of the disease, and it is only after some of the individuals so affected are slaughtered and examined that the disease can be positively diagnosed. The disease usually appears in birds that are at least one year old and over.

Infection and Spread of the Disease

Tuberculosis may be introduced into a flock of healthy fowls by purchasing stock from diseased flocks. Even the eggs from infected hens may carry the germs of the disease. Sometimes the entrails of an infected bird which has been slaughtered for home consumption are thrown into the chicken yard for the others to eat. This might cause the spread of the disease. It has been proven by those who have investigated poultry diseases that the diseased fowls are the real cause for the spread of this disease.



The infected birds throw off the germs with their excreta, thus affording the greatest possible opportunity for contaminating everything about the poultry grounds. Thus the disease may spread rapidly from bird to bird until a large part of the flock has

Do You Belong to the Juniors Club?

If you are a dairy farm boy between ten and eighteen years of age, and if your father or some member of your family is a subscriber to HOARD'S DAIRYMAN, we want you to join the HOARD'S DAIRYMAN Juniors Club.

The Juniors Club consists of several thousand boys like you, banded together to help each other get more pleasure and profit from farm life, and to have the advantage of associating with other boys who live and work and think as you do.

It costs nothing to join the club—and there are no dues. All you need to do to join is just to fill out the coupon and send it to us. We'll at once enroll you as a member and send you a watch fob, a coat lapel button, and the "Dairy Farm Boy's Creed". Do it now—then you'll soon be a full fledged member of the HOARD'S DAIRYMAN Juniors Club.

COUPON

HOARD'S DAIRYMAN Juniors,
Fort Atkinson, Wisconsin.

I want to join your Juniors Club. My father's name is _____.

I am _____ years old and like _____ (name breed) cows best. Send me the watch fob, button, and creed and enroll me as a member.

Name _____

P. O. _____ State _____ R.—

contracted the disease. Evidently, then, the germs enter the body with the food that is eaten.

How to Make Sure That the Disease Exists

Although one may be quite certain that tuberculosis exists in his flock, he can only be positive of it after a post mortem examination has been made over the body of one of the sick birds.

When the liver, spleen, or the intestine, the organs usually affected in fowls, show tubercles then the case appears to be more positive. At first the tubercles are very small, no larger than a pin head, but as the disease advances they get so that they can be plainly seen. This makes the case almost a clean cut one.

But the bacteriologist would not be content with an examination that extended only this far. You ask what else can he do. He would proceed something like this. After removing some of the tubercular tissues, he would make a microscopic examination of their contents. For this work he has to have a very high power microscope, one that magnifies many, many times. If he finds countless numbers of these little tissue destroyers as he will in tubercular birds, then no doubt remains as to the cause of the trouble.

What Can Be Done

When once detected in a flock, the easiest way to get rid of it is to destroy the entire flock. There is no medical treatment known that will cure the disease. Healthy looking birds might be used for food, but only after the internal organs have been carefully examined. The carcasses of the diseased birds should be burned or buried. They should not be thrown out for the hogs to devour, for there are cases where hogs have become infected with the disease peculiar to birds.

It always stands one in hand to keep the poultry premises clean if he wants to avoid diseases. Plenty of sunlight in the poultry house will do a great deal in the way of destroying the germ of tuberculosis. Too many farm poultry houses are constructed upon the basis that sunlight is not necessary to maintain good health in the flock. But quite the contrary is true. You can hardly get too much sunlight in a poultry house.

Before stocking up again after a diseased flock has been disposed of, the inside of the house and all the utensils should be thoroughly washed or saturated with a good strong coal tar disinfectant, followed by a second treatment in the course of a couple of weeks. Every precaution should be taken and nothing left undone which might again be the means of infecting healthy birds.

Junior Letters

Hoard's Dairyman Juniors:—I have not written for a long time and I thought I would write this evening and let you know that I am still a junior.

We are still raising the Brown Swiss cattle. My brother and I sold our grade Swiss heifers and bought two twin Brown Swiss calves. They will be one year old in July. We also own a pig. We own about eight pure-bred Brown Swiss cattle. We are milking about eight cows.

We are going to buy an alfalfa ranch this fall to go with our homestead.

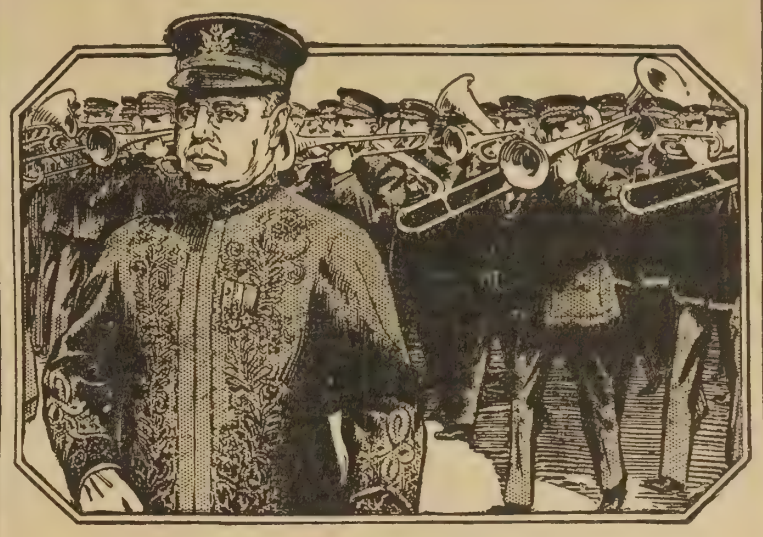
My brother and I did some trapping last winter and caught three mink, a coon, and one skunk. We got $25 for them. I do not think we got enough for them as prices were marked high. We saw a coyote while we were riding to school.

Oregon. Victor O. Freund.

Hoard's Dairyman Juniors:—I bought sixteen eggs and set them and got sixteen little chicks. They are all alive yet. My cow died.

We are going to move this fall.

My father has six cows. We have two horses. We work over a hundred-acre farm.



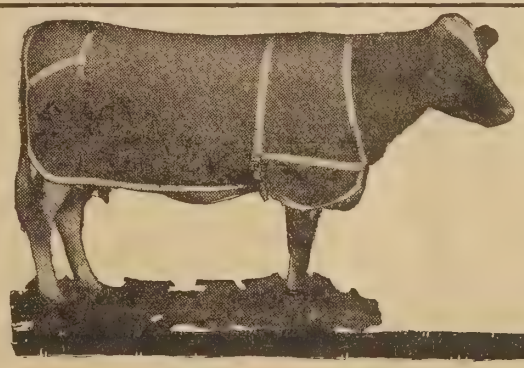
My mother raised 180 chicks.

The 29th of August I will be 11 years old. I am in the 4th grade.

My address is R. R. 3, Waupun, Wis.

Albert E. Johnson.

You can hear Sousa's Band any day when you have a Victrola



Your home, wherever it may be, is right on the line of march of Sousa's Band—of Pryor's Band, Conway's, Vessella's, U. S. Marine, Garde Republicaine of France, Black Diamonds of London, of the greatest bands of all the world. And every band *plays* as it goes marching by—on the Victrola. Plays the very music you want to hear and gives you the same thrill!

Victrolas $25 to $1500. Write to us for catalogs and name of nearest Victor dealer.

You Can't Compete With Machinery

"Better Sires—Better Stock"

We will award a money prize of $1,000 to the county that first eliminates its inferior sires.

This prize will be awarded under rules provided by the Bureau of Animal Industry, United States Department of Agriculture.

Detailed information on request.

Mixing feed on the farm is old fashioned, like threshing with a flail.

The modern time and money saving way is to have it done by machinery on a large scale.

In our mills we mix a ton of Unicorn Dairy Ration in one minute at a power cost of a few cents.

Labor is scarce and high priced. You can use yours more profitably on other work.

Unicorn requires no labor. Ready to feed, you get it as you need it. No worry or work of keeping on hand a supply of many different kinds of feed.

Made of the best feeds. Put together in the right way by men who have learned by experience.

Be wise. You can't compete with machinery. Lower your milk production cost by feeding Unicorn.

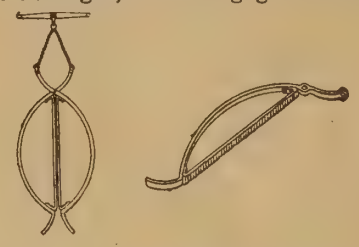
When Writing to Advertisers, Mention Hoard's Dairyman

Substitute for Teat Plugs

HOARD'S DAIRYMAN:—In place of using metal teat plugs, I would suggest the use of common cat gut or violin strings, cut to length of teat. It is well to slightly heat and burn the end so as to form a head which will prevent this plug from being drawn into the udder and makes it easier to take hold of the end to pull it out of the teat.

I am not the originator of this method of handling but it was given to me by the best cow doctor it has ever been my fortune to meet. I am glad to pass it along, although I have never tried it myself. It can be inserted each time after milking and does not irritate and is far better than either metal or wood plugs, in my opinion. Preferably, it should not be used but once but this is not so serious, perhaps, if it is used on the same cow each time and some care is taken to keep it clean and possibly disinfect it.



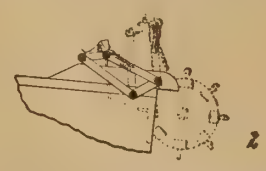
Winthrop, Me. P. A. T.

"No," said a shrewd old farmer, "I don't know as noise or talking at milking time reduces the flow of milk—but it may make the job last longer."

Inventions and Appliances of Interest to Agriculture

Brush Puller

This device is used in clearing land. It has two identical jaws, illustrated at the right, which engage the brush

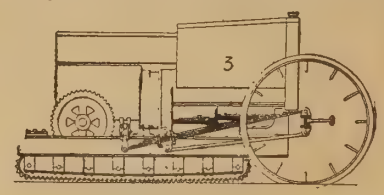


and hold it tighter the harder the horse pulls.

(W. D. Vaughan, Clarendon, Vermont. U. S. Patent 1,300,897).

Fertilizer Distributor

The new feature of this distributor is that the comb moves forward automatically to act as an end board when the box is empty, and moves

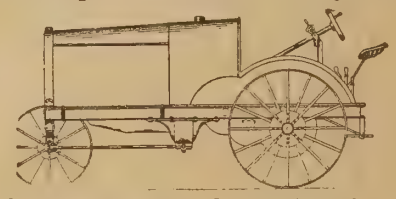


back to its operative position when the load moves to the rear.

(Deere and Co., Moline, Ill. U. S. Patent 1,325,287).

Spring Construction

This tractor has two cantilever springs so placed between the frame and axles that the load rests largely on the caterpillar tread, and only sufficiently on the front wheels to give

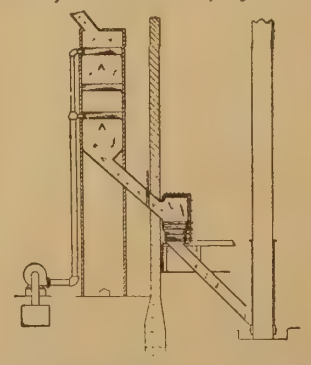


proper steering pressure.

(General machinery and Investment Co., St. Paul, Minn. U. S. Patent 1,324,974).

Tractor

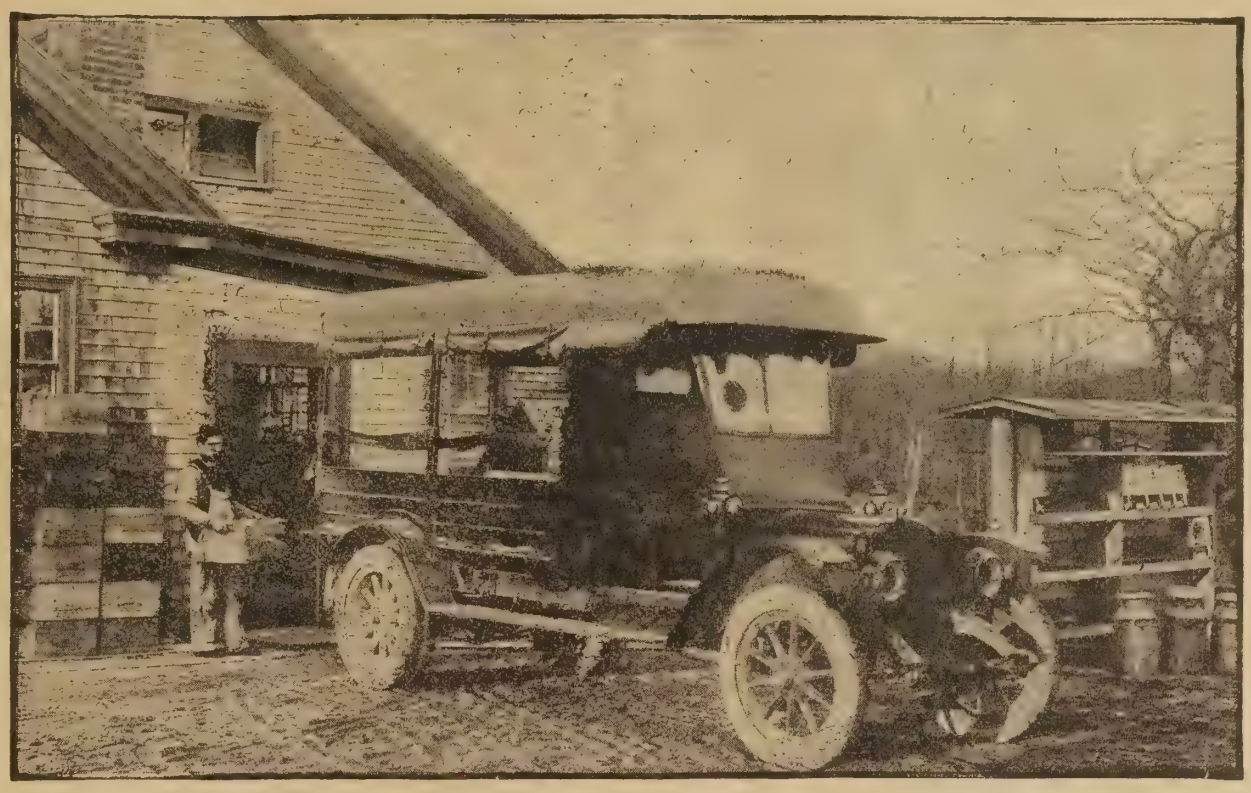
The improvement here is in the radius rods. These are bolted to the front axle at one end and hinged to a cross piece at the other. They brace



the front axle but do not draw it out of vertical alignment.

(Liberty Tractor Co., Minneapolis, Minn. U. S. Patent 1,322,049).

Bleaching Grain



Grain has formerly been bleached and freed from mold, smut, and bacteria by means of sulphur fumes and steam acting at the same time. This apparatus gives better and quicker results, it is claimed, by treating the

grain first with the fumes and afterward with steam.

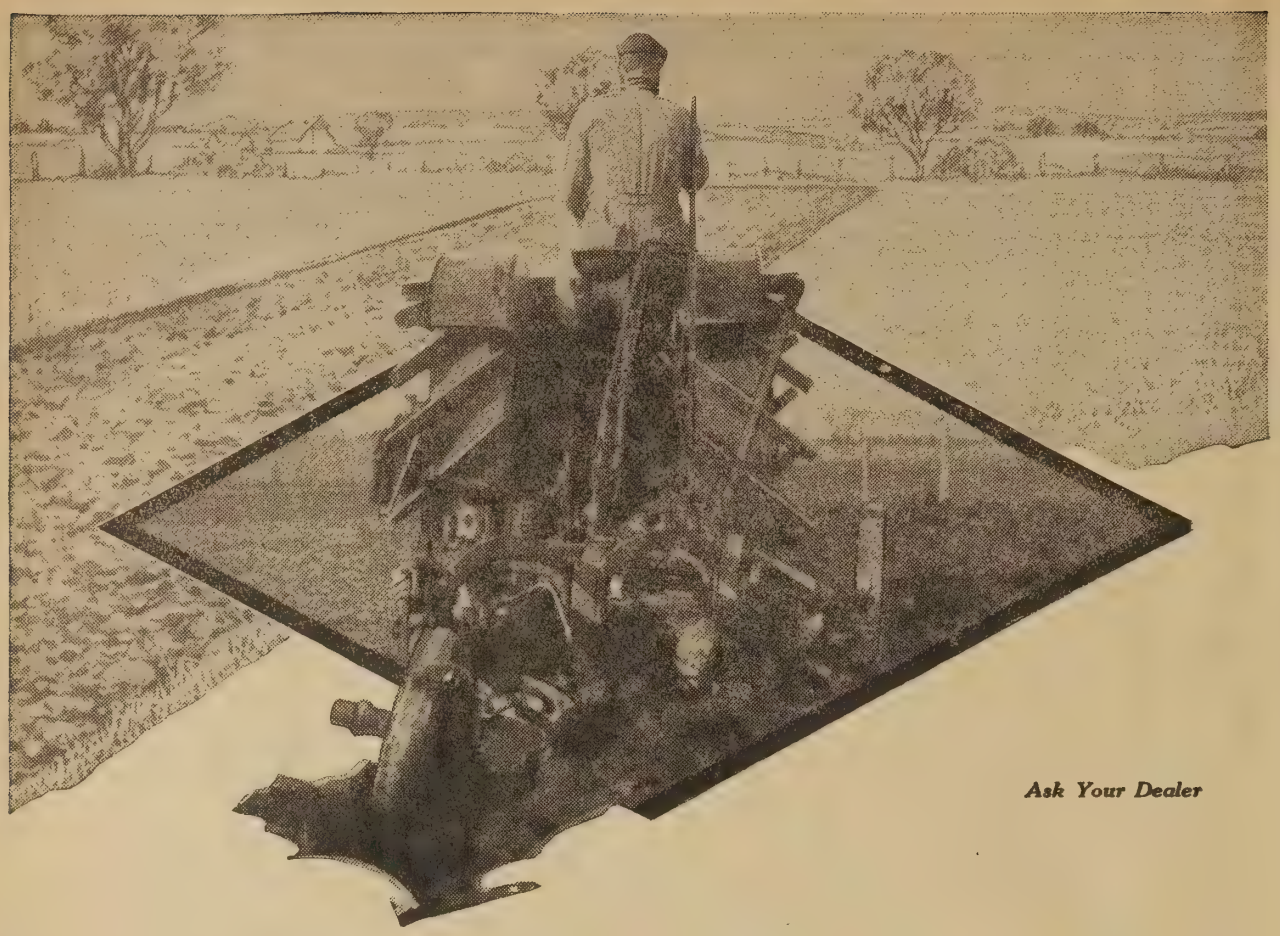
(Donahue-Stratton Co., Milwaukee, Wis. U. S. Patent 1,324,048).

Canada. C. J. LYNDE.

Loading for the city. In his White equipment, the Dairy Farmer is assured of fast, dependable and low cost transportation

The Most Work *for the* Least Money

YEARS of service in the hands of thousands of owners throughout the country furnish convincing evidence that White Trucks do the most work for the least money. Cost records show they have the highest operating efficiency with the lowest outlay for maintenance and repairs.



On your dairy farm—for general hauling on the premises, for transporting milk and other products to market or shipping points, for bringing in feed and supplies—you can afford to use White Trucks better than you can afford the less dependable service and higher operating costs of inferior equipment.

Figured by years of service, White Trucks are the most economical trucks made.

Write for booklet, "100,000 Miles and More," which tells the experience of hundreds of White owners whose trucks are still giving dependable service after traveling 100,000, 200,000, 300,000 miles and more.

THE WHITE COMPANY, *Cleveland*

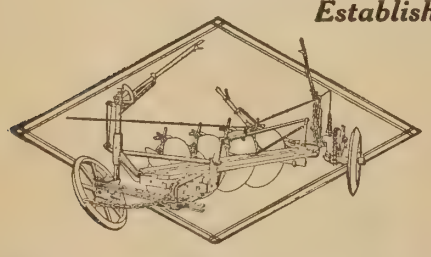
White Trucks

You Can't Overwork An E-B Plowing Outfit

NEVER mind how hard the ground, or how hot the day—an E-B plowing outfit goes right on turning land, as many hours of the day as you want to drive it.

What makes a plowing outfit as dependable as this? No one feature, nor, for that matter, a dozen. Only the longest experience, under the widest variety of farming conditions—and then a manufacturing organization big enough and far-sighted enough to utilize all the lessons of that experience.

There are, of course, a number of features of both tractor and plows—features of evident superiority.



But while such features are valuable, and set the E-B plowing outfit apart, never forget that your guarantee of trouble-free service is the whole job, the uniform excellence of *every* unit of construction.

Sixty-eight years of implement making have taught us what is necessary for dependable service. A manufacturing organization of vast extent builds this knowledge into E-B plowing outfits.

Meeting of Middle West State Farm Bureau Officers

The first co-operative marketing project of one commodity by all United States farmers will most likely be with the 1920 wool clip this fall. At the third meeting of Middle West State Farm Bureau presidents and secretaries, held at Lansing, Michigan, the American Farm Bureau Federation was asked to take definite steps to that end.

The middle west states represented have had in their wool pools 25 million pounds of wool. In all state wool pools there is an estimate of 100 million pounds. D. O. Thompson, secretary of the Illinois Agricultural Association, said the Illinois pool will soon have a million pounds in the Chicago storage house. J. R. Howard stated the American Farm Bureau wool committee will have a meeting in Chicago soon.

Plans have been in the making several months for the co-operative marketing of grain by middle west farmers. The so-called commodity system of marketing, as presented by Aaron Sapiro, attorney for fourteen co-operative marketing associations of California, seems best adapted to grain and wool marketing. The commodity plan calls for contracts with growers for half or more of all the commodity raised, for a period of several years; the pooling of that commodity and selling it through one agency direct to the manufacturer. This plan eliminates speculation.

At this meeting recommendation was made to each State Farm Bureau to send a delegate to California to study the commodity marketing plan in operation. The Federal Bureau of Markets was requested to send research men to foreign countries to study co-operative marketing methods.

Live stock marketing was recognized as a more complicated problem than any other commodity. The State Farm Bureau officers considered protesting against the proposed 33 per cent increase for selling live stock by commission men in the Chicago stock yards. This increase is in addition to an increase from 70 to 75 cents a head for cattle, and an increase from $18 to $25 as a maximum per car of cattle, made in January. H. D. Lute, secretary of the Nebraska Farm Bureau, advocated letting the increase go into effect, and start a farmers' co-operative Commission Company to handle their own stock. He stated that the Farmers' Union Commission Company at Omaha returned 65 per cent of its income back to its patrons last year. State officers agreed to discuss the establishing of a commission company at Chicago with their executive committees and get authority to act at the next meeting.

The American Farm Bureau announces that a meeting of produce association representatives will be called this fall to get together the needs of produce marketing.

Sentiment favored the opening of the Great Lakes to the Atlantic Ocean, because of its vital relation to the transportation of middle west farm products. Chas. Lawrence of the Great Lakes Tidewater Association said 70 per cent of the food consumed in the United States is raised in the middle west and almost 100 per cent of the export food products. He declared that the money farmers lose by inadequate transportation of their products will pay for it in one year. He said wheat is the easiest commodity moved, and one-half of the transportation costs from Chicago to Liverpool is for the loading charge at Buffalo and at New York or other Eastern ports. Opening of the waterway would cut out this cost.

Lewis Taylor, secretary of the Indiana Federation, stated farmers have lost more money because of strikes by labor and inadequate transportation than any other one thing. The officers refused to pass resolutions for the reason that resolutions mean nothing. The Kansas Farm Bureau officers were asked to secure Governor Allen to explain the Kansas Industrial Court at the next meeting, which will be held at Manhattan, Kansas, September 21 and 22.—Illinois Agricultural Association.

Indiana Jersey Cattle Club Tour

The precedent established by the Oregon Jersey Cattle Club of making an annual tour of the state by automobile is being followed by the Indiana Jersey Cattle Club.

The tour of the Indiana Club has been set for August sixteenth and will be one of the biggest advertising stunts ever attempted by the representatives of any breed in the Hoosier state. Brookville has been selected as the starting point and from there a caravan of automobiles filled with Jersey enthusiasts will set forth early in the morning of the sixteenth.

The entire tour will last for three days during which time some of southern Indiana's leading Jersey herds will be visited. Attractive programs have been arranged for the entertainment of the "Jersey tourists" at all stopping points.—American Jersey Cattle Club.

GAMBOGE'S ROYAL SYBIL

OWNED BY MANNSFIELD HALL FARM

Declining Feed Prices

(Continued from page 117)

better on the whole, due to ideal weather for harvesting.

The best grades of alfalfa are selling around a top of $30 a ton in Kansas City, the largest distributing market for the hay in the United States. The No. 1 grade is bringing around $27 to $28.50, while the cheapest grades are selling down to $16 a ton. The readjustment from an old to a new crop basis carried alfalfa down about $10 a ton. Clover hay is selling at a range of $14 to $19 a ton in Kansas City. Chicago quotes clover mixed around $30 a ton, and up to $28 a ton in St. Louis.

While stocks of old crop cottonseed cake and meal have been sharply reduced, with little activity in the market for spot shipment, the new crop deliveries attract much interest. As in the case of feedstuffs generally, new crop cake and meal have been depressed sharply since crushers began offering their output for fall shipment. The early sales were made around $64 a ton for 43 per cent protein grade, basis Texas crushing plants, but the market has since fallen to around $54 to $55 a ton. Compared with the old crop spot market, the new cake and meal for September and October shipment shows a discount of about $5 a ton. Even on the lower range, buyers are not taking hold, believing the cotton crop outlook and feed situation as a whole warrants a still lower level. This is probably not a high price compared with the record figures paid within the past two years, but it is still far above the normal basis.

Little demand prevails for spot offerings of cottonseed cake, the excellent condition of pastures and the rather discouraging outlook for cattle tending to withhold purchases by rangemen. Still, the stocks in hands of crushers and other operators are comparatively light, and this will retard any declining tendency in cake and meal for prompt shipment. Exporters have displayed a marked lack of interest in the high protein feeds, and are buying very sparingly.

Linseed cake and meal also are easy. The market for prompt shipment is holding around $63 a ton, Minneapolis, September around $64 and for October delivery about $65. Flaxseed crop conditions are very encouraging, promising a crop of more than 14,000,000 bushels. Demand is coming largely from small interior dealers, who are buying from a hand-to-mouth basis, while the larger operators are unwilling to take hold at current prices in view of the sharp depression in other feeds.

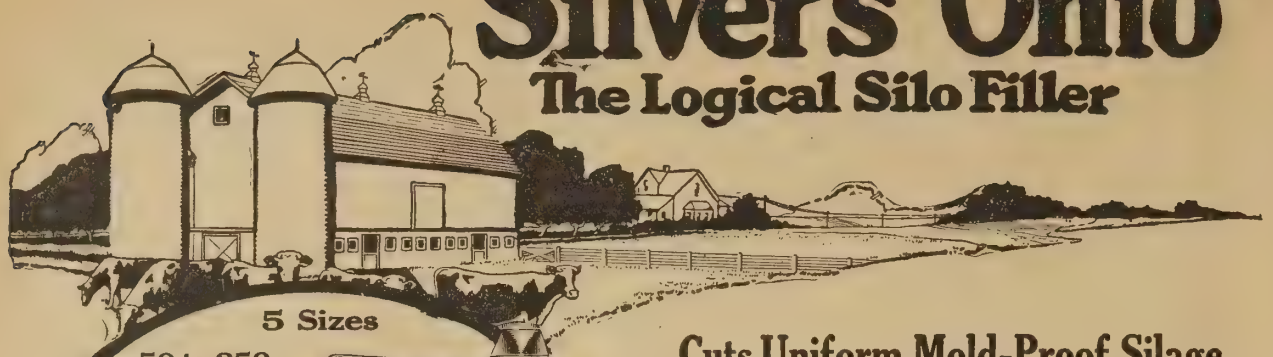
Corn is playing an important part in the bearish pressure on feed prices. The fluctuations in values for the feed grain are a vital swaying force to the high protein feeds, to bran and shorts, and to other commodities used in fattening operations. Corn is now available on markets of the Middle West below $1.50 a bushel, which represents a decline of 50 to 60 cents a bushel from the high point recorded early in the summer period. Views on the corn market are widely divergent, but it is easily apparent to note that observers of the grain trade are not hopeful of a return to the $2-level in coming months because of the prospects for an enormous harvest of the cereal. A corn crop of more than three billion bushels would not be surprising, and, unless there is a marked change in the condition of the growing crop, no sharp upturn in values is likely, at least not for the next few months. The corn visible in the United States has increased to fairly liberal proportions and will offset to a large extent a light market movement resulting from car shortage. Oats have been depressed practically as much as corn, sales in the Middle West now around 80c. a bushel or less comparing with a level above $1.20 a bushel before grain of the new crop began flowing into markets.

Much is being heard in trade circles over a possible sharp increase in demand for all feeds immediately following the announcement of higher freight rates. The broader demand is expected to result from eagerness of consumers to accumulate stocks before the advance becomes effective, which will probably be thirty days from the date of the announcement by the Interstate Commerce Commission. Such a turn in the market is probable, but it will have only a temporary effect on prices.

Tight money markets are effectively though quietly pressing prices for feedstuffs. It is a hidden force, exerting pressure from both a buying and selling standpoint. The buyer as a rule has not the credit to permit of large buying, while the seller is inclined to push his stocks upon the market to enlarge his money reserve. This already is telling in the trade, and will continue a powerful influence.

Boils

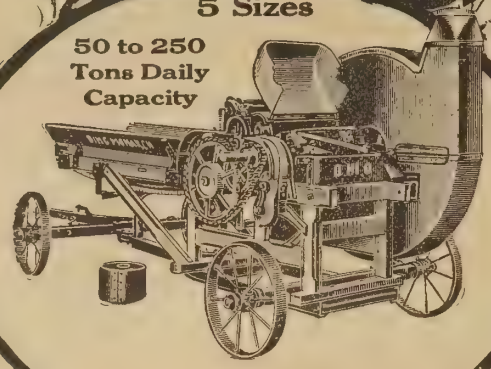
Please advise what is the trouble with the udder of a cow I own. About one week ago there appeared along the bottom of udder small knots about the size of a large pe. and they seem to be getting sore. There are possibly a dozen of such knots.



Hampstead, Md. A. R. S.

Crops of boils form in succession in such cases as the infection spreads in the connective tissue. Swab forming boils once daily with tincture of iodin until they soften; then liberate pus and apply iodin daily until well. They usually subside quickly after opening. If the condition persists rub a little ten per cent oleate of mercury into the affected areas every other day. Wash the udder and teats each time before milking. Keep the hands clean and the nails trimmed. Have the floors and gutters cleansed, disinfected, and whitewashed and keep cows out of filth and from standing in stagnant water.

Remember that the tractor has a lot of fall plowing and belt work to do yet this year. Maybe a little looking over would be a good thing.



Silver's "Ohio"

The Logical Silo Filler

5 Sizes

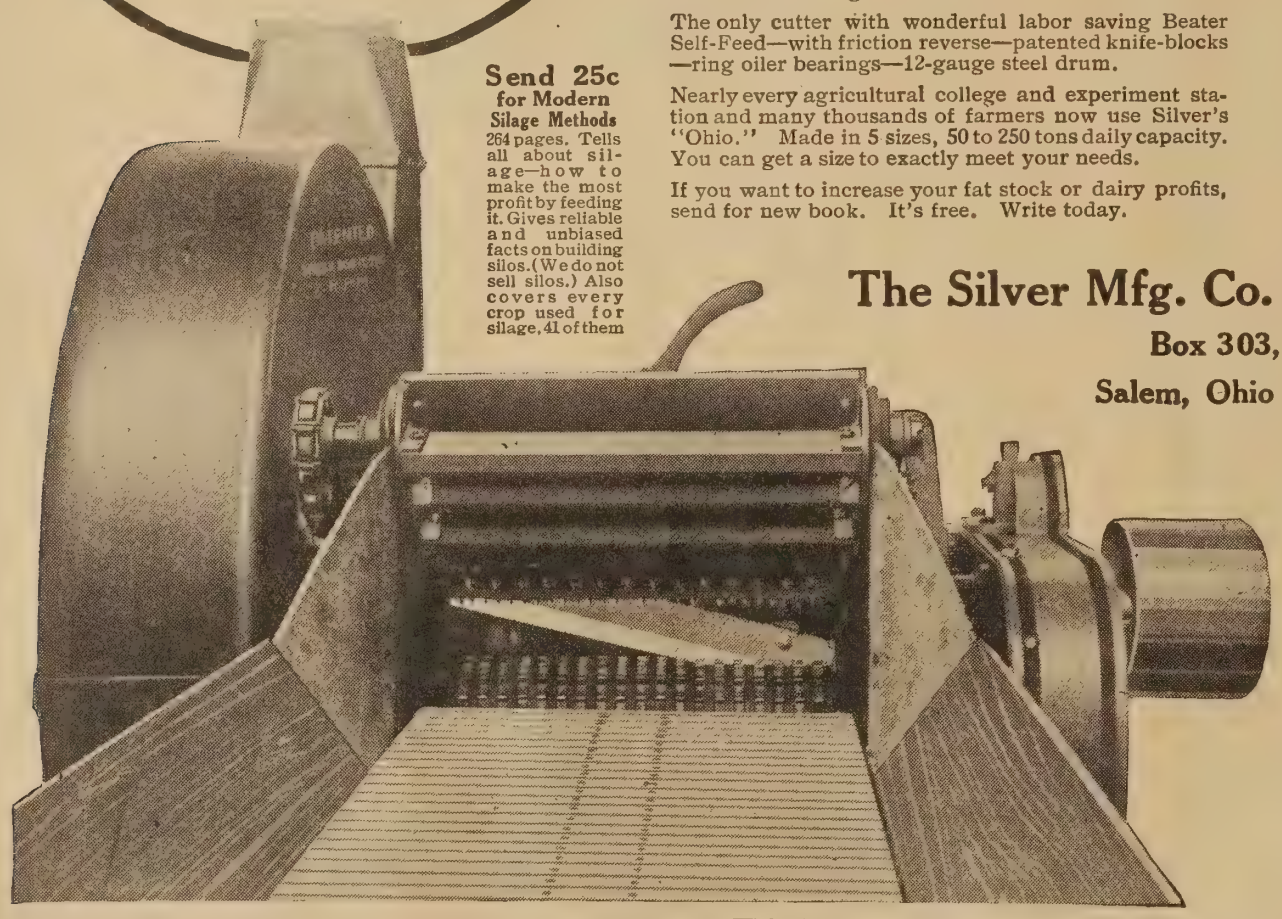
50 to 250 Tons Daily Capacity

Cuts Uniform Mold-Proof Silage

The "Ohio" knife cylinder with 14-inch bearings *cannot* spring from shear plate. The construction principle is *right*. Every leaf and joint is reduced, releasing the sugar juices necessary for proper fermentation. The result is a fine, even-cut silage reduced to a semi-pulp, free from air pockets and mold, making a highly nutritious food for your stock.

More Tons per h. p. and a Cleaner Cut.

The "Ohio" is the lightest running cutter per ton capacity. Its DIRECT DRIVE—see below—cuts power one-third, saves time and trouble, insures safety, slow speed, clean cut, long life, terrific blast—the big-fan "Ohio" never clogs.



The only cutter with wonderful labor saving Beater Self-Feed—with friction reverse—patented knife-blocks—ring oiler bearings—12-gauge steel drum.

Nearly every agricultural college and experiment station and many thousands of farmers now use Silver's "Ohio." Made in 5 sizes, 50 to 250 tons daily capacity. You can get a size to exactly meet your needs.

If you want to increase your fat stock or dairy profits, send for new book. It's free. Write today.

Send 25c for Modern Silage Methods

264 pages. Tells all about silage—how to make the most profit by feeding it. Gives reliable and unbiased facts on building silos. (We do not sell silos.) Also covers every crop used for silage, 41 of them

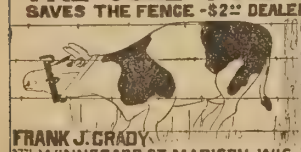
Box 303,



Salem, Ohio

Where Farming Is Profitable

Farm lands in the South have not been boosted by speculation. Why buy a farm in a high-priced section and cripple your future with debt when you can buy a better farm in the South for one-third the price? Don't you want a farm where climatic and soil conditions are unexcelled? It is our business to help you find just what you want. We know Southern lands and land values and it is to our interest to locate you where you will succeed and make business for the railroad. There is no charge for our service. For full information call on, or write to J. C. Williams, Manager, Southern Railway Development Service, 1302 Pennsylvania Ave., Washington, D. C.

Wisconsin June Butter Scoring

If all the butter made in Wisconsin during the month of June were as good as the entries sent to the Dairy School for the scoring on the 22nd, I am sure the creameries of the state would be encouraged.

A number of the tubs showed characteristic June features such as excessive moisture or leaky condition. This defect might easily be overcome by more working and this would also have helped the uneven distribution of the salt which was noticed in a few of the tubs of butter received this month.

One question asked on the method blanks sent with each tub of butter is the buttermaker's score of his butter. In one case he agreed with the judges that the score should be 95. This was an exceptionally good piece of butter made from gathered cream, but it was delivered daily, pasteurized while sweet, and the cream cooled to just the right condition for making good butter.

One or two of the tubs of butter were made from cream four days old, and the quality of this butter was considerably less than 95. One buttermaker who sent butter with a score of 94 recorded the use of an entirely new kind of starter. I have written asking more particulars in regard to his starter, as the flavor was very noticeable in the butter.

The use of electric motors in our creameries seems to be more and more common and one of the buttermakers writes this month for suggestions in regard to putting in electric motors at his creamery. I am sure anyone who is so situated that it is possible to use electric motors will appreciate the great advantage these have over any other kind of power in a creamery. I recently visited a number of factories between Madison and the Mississippi River and found that not only the creameries but the Swiss cheese factories in that section of the state are using electric power entirely.

The active demand and high price of butter at the present time evidently cut down the number of entries we received this month, but there were 26 with scores of over 90. The three highest scores went to Norman Anderson, A. T. Larson, and Geo. Nelson.

Mr. Axel Madsen of the Dairy and Food Commission comments as follows: "Having his butter scored should give a buttermaker a splendid foundation to work among his patrons for better raw material. We perhaps have some buttermakers whose only aim is to receive a high score and, if failing to do so, lose interest in exhibits. However, a true score will give the real benefit, so when we compete with other states, we shall not lose on account of thinking we have something we really haven't.

"The butter as a whole was very uniform compared with previous months. The general criticism on the butter was the indications of old, stale cream, and a few exhibits had a strong feed or weedy flavor. The buttermakers seemed to have adjusted the temperature, taking the hot weather into consideration, as the texture was very good. A few exhibits showed good quality of raw material and good workmanship, which goes to indicate that the patrons and the creamery operator are working together." E. H. FARRINGTON.

Wisconsin Dairy School.

Tester Finds Poor Strainers in Use

HOARD'S DAIRYMAN:—I have just recently completed a year's cow testing work. As a side line I spent time and money toward creating a greater desire on the part of the farmers in my association to respect sanitary methods of straining their milk. I had an up-to-date strainer and sediment tester. As a rule, farmers who are particular about their milk straining methods are scarce and far apart to my notion.

During one year's testing the tester encountered several types of strainers used which were average in efficiency. In their order comes the large strainer with three grades of mesh and an upper cloth to hold the larger objects such as hair and straw, the single strainer with a ring below for a cloth and a wire mesh above, single strainer of tin with no cloth above or below, and lastly the airy cheese-cloth full of holes—usually unseen.

Quite generally the good farmers appreciated a good strainer but occasional sediment tests showed some disgusting results. Many instances could be cited in which the owner took pride in a strainer doing poor work of which he didn't know. Monthly tests proved to him that a better strainer was an asset and an object of pride. Sometimes a lowland pasture was the seat of the trouble, the cows bringing silt and clay on their udders and flanks. It was suggested that a few minutes to wash these parts would eliminate the major part of the trouble and, at the same time, make the cow more cool and comfortable. After this the sediment tester results were gratifying in all cases.

The best results were secured on the county farm where a special type of strainer was used at all times. Briefly described it was a bowl accommodating a hollow sphere which had three grades of mesh brass strainers. This was screwed to the inside of the outer bowl at the neck. A cloth held securely over the top of the bowl prevented straw and other objects from clogging the wire strainers. With a few exceptions the work of this strainer was almost perfect.

It is disgusting to describe the inefficient work of the cheese-cloth strainer. The test disks showed invariably at all seasons yellow and stringy matter with straw and silt galore. Milking machines eliminated some of this but a cheese-cloth strainer is an indication of the owner's character and habits.

Wisconsin. VICTOR M. ANDERSON.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Blood in Milk

Several days ago my cow came up in the evening with the right front quarter of udder badly swollen. Upon trying to milk her we found this quarter filled with blood (instead of milk) and badly clotted, making it difficult to strip out. There were no marks of any injury on the udder; nor was it painful to the touch as I bathed it with hot water and massaged it thoroughly and greased it with melted lard. The swelling has subsided but the other conditions remain. Cow has been fresh about six weeks and calf was allowed to suck as I wanted fine veal. As soon as the trouble came on I vealed the calf.

Coupeville, Wash. F. B. W.

Injury apparently caused rupture of blood vessels in the quarter mentioned and bunting by the calf would be a possible cause. Treatment now should consist in bathing the affected quarter three times daily with cold water and vinegar and giving the cow a level teaspoonful of dried sulphate of iron and three teaspoonfuls of table salt in her feed each evening. Increase the two such doses daily if the trouble persists and the cow is not well along in calf. Unless infection or mammitis (garget) results from the present condition the cow should perfectly recover.

Periods of Heat

1. How many days after a cow drops her calf is she in heat the first time, and how often after the first time?
2. Also when would a heifer calf soon a year old come in?
3. The cow has two heifer calves, born last and this year and how can I breed her now so I can get another next year?
4. What is the cause of pigs being born dead?

Donaldson, Minn. N. R.

1. A cow sometimes comes in heat about seven days after calving, but usually the first period occurs in four weeks. It is not considered advisable to breed a cow at the first period mentioned.

2. A heifer may come in heat regularly when five or six months old and usually is bred to calve when two years old, or thereabout. Periods of heat recur at intervals of twenty-one days.

3. If a cow fails to come in heat have a trained veterinarian treat her womb and ovaries. See recent answers under title of failure to come in heat.

4. Pigs often come dead when the sow is prevented from farrowing quickly by reason of constipation, flabbiness, weakness, or sickness. Drugs also may cause dead pigs, or their death may be due to germ infection. If you care to tell us how you fed and cared for the sow we may be able to give you helpful advice.

Abortion

A year ago I bought a farm here which I still own. There is a mixed head of 14 cows and 5 heifers. In some way last winter contagious abortion got into the herd. I have taken as good care of the cows as possible. The veterinarian here told me my barn was kept in first class condition. He advises me to sell off my cows and buy new ones. This means a big loss to me.

New Lisbon, Wis. P. P.

Do not sell the cows. The disease will be likely to die out in time or the cows become immune after aborting several times, if you treat them as follows:

Cleanse, disinfect, and whitewash the stable. Use a mixture of one part of compound cresol solution and 30 parts of water for disinfecting purposes. Use fresh-made whitewash. Isolate cows that have aborted and if possible have each of them treated by a veterinarian who has had special training in such work and who owns modern instruments for its effective application. Meanwhile flush out the vagina of each cow every other day with lukewarm boiled water containing 30 grains of permanganate of potash to the gallon. When a cow is bred continue the vaginal injections until she goes past one period without coming in heat. Before breeding any cow or heifer flush out the vagina daily for two or three weeks with the permanganate solution. Use a like solution to disinfect the sheath of the bull before and after each service. The bull need not have been sold. Apply to the state agricultural experiment station for a bulletin on abortion.

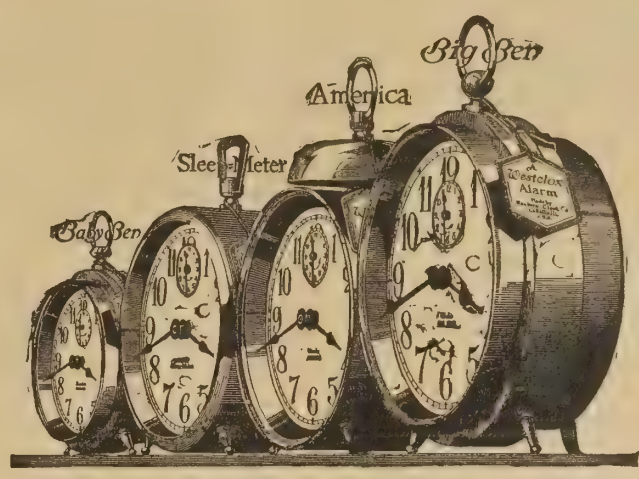
Blindness

We have two pure-bred Guernsey calves, one two weeks, the other 6 months old, that have gone blind without any apparent reason. In every other way they appear to be perfectly healthy. Our veterinarian does not seem to be able to remove the trouble or define its cause. Can you enlighten us?

Biglerville, Pa. G. W. K.

Blindness from amaurosis or palsy of the sight (paralysis of the retina and optic nerves) sometimes follows a shock, injury, or loss of blood from an operation such as castration. It may also result from lightning shock. In a few instances we have seen it occur as a reflex from severe derangement of the digestive organs. In the latter cases a physic possibly may do some good, but in most instances the condition is incurable.

Increased Testing in Indiana



The year ending July 1, 1920, showed the greatest increase in official testing in Indiana that has been seen in any year. This great increase shows clearly the growing interest in dairying and especially with regard to pure-bred cattle. The owners of pure-bred cattle are beginning to realize that buyers of young stock are looking for those animals whose dams and sires' dams have production records and that the cost of testing cows is very small as compared to the increased value of the offspring from cows with good records of production. The high cost of feed is undoubtedly another reason why breeders are testing their cows, for with feed at present prices a breeder feeding a herd of low producing cows will soon have to get into some other business.

During the last year a larger number of seven-day tests have been made than during any previous year. One hundred twenty-one seven-day tests were completed, which is an increase of 73 per cent over the seven-day testing done last year. Eighteen fourteen-day tests were made, an increase of 157 per cent over the fourteen-day test made last year. The number of breeders doing short-time testing showed an increase of 89 per cent. In the year the number of breeders doing yearly testing showed an increase of 25 per cent over the number during the previous year. There were 539 cows on yearly test during this year, an increase of 46 per cent.

The number of Guernsey herds on test increased 200 per cent. A large part of this increase was due to the calf clubs which have been started and as these heifers freshen their owners, though most of them are boys and girls, have started them on official test. The Jersey herds on test have shown an increase for the year of 12 per cent.

While the number of cattle on official test in Indiana is not large, as compared to that in some of the more strictly dairy states, the increase shown in one year is probably much greater in proportion than that which would be found in those states. Such an increase in official testing is an indication of the rapid improvement in the quality of the pure-bred dairy cattle in Indiana. A few such years will put Indiana among the leading states in the amount of official testing done.

Indiana. L. H. FAIRCHILD.

Four well-known Westclox

YOU like an honest clock for the same reason you like an honest man. You can depend on what it says.

Westclox alarms make and hold so many friends because they run and ring *on time*.

The secret of their dependability is inside the case—Westclox construction.

The wheels turn on needle-fine pivots of polished steel. Friction is greatly reduced; the clock runs more smoothly and gives you longer service.

Big Ben, America, Sleep-Meter and Baby Ben are the four top-notchers of the Westclox line. But all Westclox alarms have this same construction. The men who make Big Ben take pride in making every Westclox right.

It will pay you to look for the Westclox mark of good timekeeping on the dial and tag of the clock you buy. Then you will have a timekeeper that you can depend on for honest, faithful service.

WESTERN CLOCK CO., LA SALLE, ILLINOIS, U.S.A.

Makers of *Westclox:* Big Ben, Baby Ben, Pocket Ben, Glo-Ben, America, Sleep-Meter, Jack o'Lantern

Factory: Peru, Illinois. *In Canada:* Western Clock Co., Ltd., Peterborough, Ont.

ABORTION IN CATTLE

CAN BE TREATED SUCCESSFULLY AND YOUR COWS MADE PROMPT REGULAR BREEDERS BY

STERILOID

STOP LOSING CALVES

TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for **FREE BOOK.** It explains the causes and symptoms of Abortion and tells how to treat Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

GUARANTEE: We will refund money in every case when STERILOID FAILS to make good. PRICE $1.00. Mailed Postpaid, in plain wrapper.

MARTIN REMEDY COMPANY, Dept. A, 398-408 Columbus Ave., New York City, Reference—Colonial Bank.

Prices of Wheat Bran and Middlings

For farmers who buy considerable amounts of mill feed, a knowledge of the seasonal trend of prices should be helpful in determining when to buy most economically.

The following figures show the average Minneapolis carlot monthly prices of wheat bran for the ten years 1905-1914 inclusive:

Month	Price per ton	Per cent of Jan. price
January	$19.25	100
February	19.38	101
March	19.53	101
April	18.93	98
May	18.82	98
June	17.39	90
July	17.00	88
August	17.91	93
September	18.31	95
October	17.95	93
November	18.11	94
December	19.38	98

During this ten-year period the lowest prices of the year occurred three times in July, three times in October, and one each in June, August, November, and April.

From the foregoing it would appear that on the average one would save sufficient on his feed bill to make it a practice to buy a year's supply during July or October. Farmers who do not have to buy feed every year probably would find October a more suitable month for purchasing supplies as the crop has then been harvested and the farmer can quite accurately forecast his feed requirements.

Prices of Standard Wheat Middlings

The following figures show the ten-year average monthly carlot price of wheat middlings at Minneapolis for the ten years 1905-1914 inclusive as compiled from the Northwestern Miller:

Month	Price per ton	Per cent of Jan. price
January	$19.53	100
February	19.81	101
March	19.76	101
April	19.53	100
May	19.79	101
June	19.29	99
July	19.60	100
August	20.41	104
September	20.51	105
October	19.61	100
November	19.29	99
December	19.60	100

From the foregoing, it is apparent that there is much less seasonable fluctuation in the price of middlings than is the case with wheat bran. This is doubtless due to the fact that wheat bran is very largely used for cows and therefore not so much in demand during the season of good pasture. Upon the other hand, wheat middlings are extensively used for feeding pigs and the prices tend to be at their highest during August and September, which is a season when many pig growers are short of feed due to the fact that the pigs are large enough to require considerable feed, but when new corn is not available in large quantities.

Particular attention is called to the fact that for any one year the trend of prices may be very different from the average.—Wm. L. Cavert, Minnesota College of Agriculture.

BELLE LYON'S KORNDYKE HENGERVELD

Holstein heifer whose junior two-year-old 7-day record is 413.5 lbs. milk containing 13.18 lbs. fat. Purchased at recent Ohio State Holstein Sale by D. Postlewaite of Ohio from N. W. Lee & Son.

Better Lighting for the Farm Home

HOARD'S DAIRYMAN:—In discussing better lighting methods for country homes and village communities recently Wm. Kumerth, associate professor in physics, Iowa State College, said: "There is a growing realization among the farm people of the fact that good illumination is as much a necessity as are pure water, fresh air, and proper sanitation and that the effect of poor lighting, whether natural or artificial, reacts strongly on the health.

"In the past decade a multiplicity of modern improvements has added greatly to the comfort and convenience of farm homes and rural communities. In the last few years the matter of lighting systems has been receiving considerable attention, perhaps because of the more extensive study which has been devoted to all phases of city lighting and to continued improvements in the illuminants themselves.

"Illumination is a symbol of intellectual development, for one of the most important factors in the growing forces of civilization has been the steadily increasing opportunity for study after dusk. The New York State Health Department has found that while 21% of country school children have defective vision, only 5% of city school children are so afflicted. One might naturally expect the reverse to be true. For all that, investigation has revealed the fact that city school children in general have stronger eyes than do those in the country, probably because of the superior lighting which city school children enjoy in their homes. But poor lighting conditions need not obtain for the rural family. Very good lighting can be secured from practically every kind of illuminant if proper attention is given to the subject. The result will be fewer headaches and stronger eyes.

"The country home should be well lighted, not only because light safeguards the eyes, but because a well lighted home is attractive and fosters a cheerful disposition. Proper attention paid to the lighting of the home may help solve the problem of keeping the young men and women on the farm. Just as a moth is attracted by the light of a candle, so young people are drawn by good lighting. Abundant light in their own homes where they may read in comfort, or play games, will contribute largely to their staying at home evenings. The depressing atmosphere of many a dimly lighted country home has no doubt been a substantial factor in driving its young people to seek residence in the brightly lighted towns and cities.

"With his greatest interest concentrated on his stock, machinery, and crops, the farm husband has frequently neglected in the past to give the proper attention to his home. But the day is now rapidly approaching—in fact it is already here—when farm women are coming into their own and the improvement of the farm home is receiving proper attention.

"Of all the different illuminants available for country homes those of the lowest initial cost are more likely to be introduced first. In the past the only available illuminants have been low priced. As farmers grow more prosperous they are inclined to consider some higher priced system. In a few instances the cost of installation may appear high, but it should be remembered that some of these systems serve a double purpose. Thus where illuminating gas, natural gas, or Blau gas can be obtained, the system when once installed will lend itself to both heating and lighting at moderate cost. In the electric system the apparatus also lends itself to other uses, such as power, when it can be conveyed through circuits taking small current. When the 110 volt system is available, either through private installment or the tapping of a transmission line, many uses can then be found for electricity on the farm, while the lights will be practically as effective as in the city.

"In the following table may be found the total approximate cost of lighting an eight-room farm house for one year: Candle, $114; kerosene, $40; kerosene pressure lamp, $31; gasoline reading lamp, $31; gasoline system, $37; acetylene plant, $70; public service electric, $74; high voltage private, $131; low voltage private, $97."

Iowa. H. J. METCALF.

The protest of farm women against rural living conditions is said to be a chief factor in the migration from country to city.

BROWN SWISS

Buy a Brown Swiss Bull

Dairying Thirty Years Ago

Notes From the Issue of Hoard's Dairyman for August 15th, 1890

Dr. S. M. Babcock had just finished the perfection of the Babcock tester and furnished Hoard's Dairyman a long article giving drawings of the tester and directions concerning its use. There has been a surprisingly small number of changes in the manipulation of this test since this article was written nearly a third of a century ago.

"Millions of dollars lost this year by turning the cows out into the burning sunshine, when they ought to have been in a cool, airy stable with screened windows."

"It is said that many a race has been lost to the cross horse that displayed his ill temper by biting at the horse that was neck and neck with him; and that if he had put such wasted energy into his legs, he would have "got there" ahead of his competitor. Same with many a cross and worrying man."

"Now, that we know that the old barns were made with too few and too small windows, it makes us ache to see a new barn going up with but little if any improvement on the old ones, in that respect. Windows are most as cheap as either stone or brick wall, and should be put in large, and plenty of them."

"A heated controversy was being carried on regarding the use of preservaline. Dr. S. M. Babcock had attacked its use and Hoard's Dairyman offered the manufacturers "the chance they need in vindication of their business" and allowed them the use of its columns in defending their product. The Official Analyst of Montreal was quoted as certifying that the analysis he had made of this product showed it to be an "innocent preservative salt, an antacid and favorable for the preservation of milk and dairy products."

The markets for dairy products were indicated in these reports:

Elgin, Ill., Aug. 11—Butter—Call board sales easy 20¼c.

Floor sales at 20-2¼ @20½c. Aug. 4, 1890, butter sold at 19½-20@ 20½c; Aug. 8, 1889, butter sold at 15½c; Aug. 13, 1888, butter sold at 19c; Aug. 15, '87, butter sold at 27c.

Sheboygan Falls, Wis., Aug. 12.—The market was slower than usual today, yet prices held up exceedingly well considering the reports from Chicago and eastern markets. The sales reported were 35 Twins at 6½c; 100 Twins at 7⅝c; 1,550 at 7¾c; 755 at 8c; 90 cases Americas at 8¼c; 600 at 8½c; 1,177 at 8¾c.

Wisconsin Short Course

The "Short Course in Agriculture" was established at the Wisconsin College of Agriculture in 1885 and the achievements of the 5,540 students who have attended that course are living demonstrations of the wisdom and foresight of former Dean Henry who first conceived of this type of instruction. The plan of the short course is outlined briefly in the following paragraphs from a recent announcement:

"The Short Course consists of three terms of five weeks each. Students may enter at the beginning of any term. The course is so planned that a definite unit of work is completed during each five-week period. The course will start the middle of November and the studies for the first term (five weeks) will be completed at the time of the Christmas holidays. The second term will start after the vacation and the work of this term will close at the end of the first week in February. The third term will begin the second week in February and close the middle of March. The course will be completed in good time to permit the student to return to the farm to begin the spring work.

"Under this plan Short Course students will concentrate upon a few subjects for each term and complete them before taking up other subjects. Instruction is given by means of lectures, recitations, laboratory practice, demonstrations, and conferences. Opportunity is given for students to secure answers to individual questions, which makes the work practical and helpful to them.

"The course of study is so arranged as to give the students an idea of the fundamental sciences which underlie successful agriculture. The principles and approved practices of profitable farming based upon these fundamental sciences are explained."

Further detailed information and application for admission may be secured by writing to Director of Short Course, College of Agriculture, Madison, Wis.

SWINE

Alfamarl Springs
OFFERS FOR SALE

Rex of Alfamarl Springs by Union Star, a richly bred Yeksa bull whose dam, Reunion, made 576 lbs. fat at three years; out of Goldie Belle, a good daughter of Tricksey's Sam. He is ready for service.
F. M. TESS, Mgr., - Troy Center, Wis.

MORE PORK IN LESS TIME

Duroc-Jersey hogs have a tendency to put on great amounts of pork at an early age. They are easy-feeding animals, and raise large families. These hogs were introduced less than 50 years ago, and yet in 1918, 51% of all the hogs marketed in the country were "Duroc-Jerseys." They are uniformly red in color. Increase your profits by raising Duroc-Jersey hogs.
Write for "DUROC-JERSEY HOGS ARE PROLIFIC AND PROFITABLE"—sent free to hog-raisers by the largest swine record association in the world. Over 12,000 members.
The National Duroc-Jersey Record Association. Dept. 300 Peoria, Ill.

Four World's Record Cows at Ravinia

You Want Bigger Cream Checks

You may like a cow for her looks but she pays for her feed bill in milk.

Ravinia Ayrshires

are beautiful to look at too; but the big thing about them is that they "milk like a pump."

They have proved this by the world's records they have made; and will prove it to you in the bigger cream checks you get from them and from the herd you can breed out of them.

We can tell you some things about increasing your cream checks that you ought to know, and we'll be glad to do it. Get some paper and write us a letter right now about your breeding problems.

The best of breeding. E. N. Manley & Sons, Lyons, Neb.

Fall-sown Oats

Fall seeding of oats has numerous advantages over spring seeding, where the fall-sown varieties can be successfully grown, as in the states of South Carolina, Georgia, Alabama, Florida, Mississippi, and Louisiana; in Virginia and North Carolina, except in the Piedmont and mountain sections; and in southern and eastern Texas, announces the United States Department of Agriculture, in Farmers' Bulletin 1119, entitled "Fall-sown Oats."

Under the climatic conditions in those states, the fall-sown crop usually yields better and matures earlier. The land can usually be prepared in better shape in the fall than in the spring. Fall seeding interferes less with other work. Poorer land and less fertilizer can be used. The fall-sown crop furnishes a cover for the soil during the winter and prevents washing.

The bulletin gives the varieties best adapted, cultural methods, and rotations. This bulletin will be supplied on request by the U. S. Department of Agriculture, Washington, D. C.

Economy in Production ← GUERNSEYS → Quality of Products

The Guernsey readily adapts herself to wide extremes in climate. Notable records of production have been made in Maine, Florida, Louisiana, Washington, and Northern Minnesota. Send for our free literature.

THE AMERICAN GUERNSEY CATTLE CLUB, BOX H 75, PETERBORO, N. H.

For Sale

Fond du Lac Guernseys

Send for County Sale List. Several high class bull calves, some heifers. 50 good grades can be had now.
B. F. SHERIDAN, Secretary, Fond du Lac, Wis.

Do You Want A Bull Calf Sired by Anton's King Confidence?

His dam, Ma Chere Confidence 55851, A. R. 5727, has a record in Class C, of 764.65 lbs. of butterfat in one year.

Anton's King Confidence 43517

At the present time, we are offering several very desirable young animals that will be ready for service this fall. They are all out of A. R. dams or two-year-olds, that are now on test.

The strong May Rose breeding on the sire's side (A. K. C. traces five times to May Rose 2nd) combined with Starlight's Excelsior and Yeksa traces on the dam's side make these young bulls representative of the best blood in Guernsey circles.

Their conformation is of the very best—straight tops, long, deep barrels, and good width, all linked firmly with refinement and dairy temperament. Write for complete information.

HOARD'S DAIRYMAN FARM, FORT ATKINSON, WIS.

Facts in BLACK & WHITE

What Holstein Cows' Milk Means to Mothers

The almost invariable verdict of doctors who have made a serious study of the question of cows' milk has been in favor of Holstein cows' milk. Dr. Hubert Work, Superintendent Woodcroft School for Feeble-minded Children, Pueblo, Colo., says: "In practice I abandoned Jersey milk for infant feeding because I could not successfully modify it for babies. This was suggested to me by the statement that a Jersey cow's milk is not always tolerated by her own calf. **Holstein cow's milk needs no modification for the healthy child.** Although the mentally feeble are always of low physical vitality also, we have never admitted a feeble-minded child who did not take Holstein cows' milk and thrive on it."

Send for "Specialists' Evidence."

The Holstein-Friesian Association
101 Hudson Street, Brattleboro, Vermont.

BEECHER WYTHE 2ND

Butter 7 days 19.65, milk 534.6 at 15 years of age, 75 days after freshening; 19.1 lbs. butter, 548 lbs. milk, 109 days after freshening.

At 14 years of age, Grand Champion Cow of Indiana 1918; 22,554 lbs. of milk, 800 lbs. of butter, as a ten-year-old. Dam of 12 consecutive heifer calves and one bull calf. Nine A. R. O. daughters.

2 Serviceable Bulls For Sale

Sired by King Colantha Lyons, a 35.68-lb. son of King Lyons, out of a 29-lb. daughter of King Segis.

No. 1. Born April 18, 1919. Two-thirds white, nicely marked, good individual. Dam: 16 lbs. butter in seven days at 24 months. His grandam, Beecher Wythe 2nd. This cow has produced over 100 tons of milk and is now nearly 16 years old, is still milking at a great clip. Price $500.

No. 2. Born March 11, 1919. Five-sixths white, good individual. His dam, 13 lbs. butter at 2 years. Price $250.

A GRANDSON OF "COUNT"

from a 28.5-lb. dam that is now on yearly test.

His sire, Sir Johanna Fayne Segis Pontiac, is by King Segis Pontiac Count and from one of the best daughters of Oak De Kol Ollie Homestead.

His own dam produced 28.5 lbs. of butter from nearly 700 lbs. milk in 7 days and is doing very well on semi-official test.

The calf himself, herd No. B. 55, is a dandy and one we know will suit. First check for $600 takes him.

Lord Netherland Rag Apple

Son of Ex-Champion 4-yr.-old Heads Our Herd

Five of his six nearest sires have 40-lb. daughters. Four of his six nearest dams have 31-lb. daughters. His two nearest dams average over 40-lbs.

We have his first sons for sale.

LAWRENCE PAUMIER, - - (Stark Co.) - - Louisville, Ohio

FOR SALE AND EXCHANGE

25 head of Holstein cows, 23 of which are high grade and 2 are registered. Also herd bull, a grandson of K. S. P. A., the fifty thousand dollar bull. This bull is from a 27-lb. cow. Most of these cows bred to this bull. All young cows and well marked, good heavy producers. Price $200 per head if the herd is bought together. Will take two good teams of draft mares or mules as a partial payment. Might consider a good automobile as a partial payment.

G. A. HIGGINBOTHAM, ROSSVILLE, KANSAS.

BUY A BULL

That carries the blood of Colantha 4th's Johanna, Sir Pietertje Ormsby Mercedes and Spring Brook Bess Burke. These represent, we believe, the very best producing combination of the breed. We are just now able to offer sons of S. P. O. M. 38, carrying just this combination and backed by excellent A. R. O. records.

If you want one, write at once. We don't have them long.

Who Pays The Price?

All stockmen have losses. Usually they come unexpectedly. That's why live stock insurance is desirable. It protects your invested capital. It reimburses you for loss.

We protect your investment at a cost less than the interest rate on the money you would use to replace a loss. When you lose an animal we pay you the money to replace it. WE PAY THE PRICE.

350 HEALTHY HOLSTEINS—UNDER FEDERAL SUPERVISION

"IT IS OUR AIM TO PRODUCE FOR THE PROGRESSIVE DAIRYMEN WHO DESIRE HIGH MILK PRODUCTION WITH

WHEATFIELD FARMS

A HIGH AVERAGE BUTTER-FAT AND STURDY INDIVIDUALITY AT REASONABLE PRICES"

"Four Aces and a King"

AT THE HOME OF THE WORLD RECORD TWINS, TWO-YEAR JR. We are offering FOUR 30-LB. CANDIDATES of serviceable age by KING MODEL, KING BURKE OF THE PONTIACS, JOH SEGIS AND BLOOD ROYAL

out of 22- to 30-lb. dams b. f.

Also a number of promising YOUNGSTERS, less than a year old, by our Senior Herd Sire:

ORMSBY JANE KING

By: AAGGIE CORNUCOPIA JOHANNA LAD, The Great Show Bull, and ORMSBY JANE SEGIS, The Famous 46.33-lb. cow.

Write for pedigree and prices and if you are in line to breed

TYPE, INDIVIDUALITY AND PRODUCTION

into your herd, we have very interesting news for you.

WHEATFIELD FARMS

J. C. Dold, Owner. R. F. D. No. 14, LA SALLE, N. Y.

Young Bulls Backed By Yearly and Seven Day Records

We have for sale a few young bulls, up to 11 months old that are sired by our senior herd sire Finderne Pride Johanna Korndyke. He is one of the best sons of King Segis De Kol Korndyke and from Finderne Pride Johanna Rue, former world record cow with 1470 lbs. butter in 1 year. These youngsters are well grown and are all from A. R. O. dams with records up to 30 lbs. Write us for full information. We will answer promptly.

ANTRIM FARMS, - - SYRACUSE, NEW YORK.

Polled Holsteins

registered in the Herd Books of the Holstein-Friesian Association of America. Herd sire out of world's record senior four-year-old, KEYSTONE BEAUTY PLUM JOHANNA NO. 161646.

At 4-10-20, 365 days—*25,787.5 milk; (4.02%) 1,294.7 butter.*

At 3- 3-23, 365 days—*22,496.6 milk; (3.94%) 1,108.9 butter.*

2 years under full age—*48,284.1 milk; 2,403.6 butter.*

The youngest cow in the world to have two consecutive records averaging over 24,000 lbs. of 4% milk in a year. Bull calves $100 and up.

GEORGE E. STEVENSON & SONS
CLARKS SUMMIT, PA.

Edinboro Lake Farm

Show Type HOLSTEINS Production

Six state yearly record champions 1918-19.

We offer bull calves by Sir Paul Veeman Hengerveld and Sir Ormsby Skylark Fredericka, out of yearly record dams with type.

Edinboro, Pa.

FOR SALE

2 Choice Holstein Bulls

One age 11 months with 23-lb. dam, sire 31-lb. son of King of the Pontiacs. No. 2. Age 6 months, dam 27-lb. 4-year-old, sire 31-lb. son of King Walker Segis.

CLARK & SICKMON, HONESDALE, PA.

Will Sell at Auction

August 17, 1920

My Entire Herd of 36 Head of Holsteins

Fairview Dairy, Pittsburg, Kansas

12 BULLS FOR SALE

Seven are ready to use. All are good individuals and nicely marked. Sires: King Segis De Kol Fayne 8th, a 25.63-lb. grandson of King Fayne Segis and Peldora De Kol Pontiac Pietertje, a 29.52-lb. grandson of King of the Pontiacs. Some have A. R. O. records. For pedigrees and prices write **C. I. Reamer, North Liberty, Ind.**

Last Chance to Get a Son of Sir Veeman Hengerveld

Sir Veeman Hengerveld Dodo 299077, born Dec. 26, 1919. A large, well grown fellow, fine individual, in color a little more than half white.

Sire—Sir Veeman Hengerveld, who now has 120 A. R. O. daughters, 17 of them with records above 30 lbs., and for the opportunity that he had in his younger days he has proved himself to be the greatest sire of the breed.

Dam—King Segis Alcartra Dodo Jessie. A. R. O. at 2 yrs. 10 mos., butter 19.24, milk 389.80. She is a granddaughter of King Segis Pontiac Alcartra. She is in my herd at the present time and a prospect for a large record in the future.

This bull has been Federal tested. Price $500.

W. D. ROBENS, Poland, New York.

King Segis Bred Bulls

We have a limited number of calves and yearlings of KING SEGIS breeding.

Each individual has been picked from heavy producing dams and sires, many with large A. R. O. records and containing the best foundation blood of the breed.

Prices are reasonable. Write for pedigrees.

G. G. BURLINGAME, - CAZENOVIA, N. Y.

BULL CALF

Sire's dam, butter, 1 yr., 848 lbs.; her daughter, 1,055 lbs. Grandsire's dam, 987 lbs. at 11 yrs.; her full sister, 1,344 lbs.; another, same dam, 1,322 lbs. Dam, Miss Pietertje Alexina 3d, sister to Miss Pietertje Alexina 2d, 1,290.91 lbs. A dandy calf, priced right. Write quick to

McKAY BROS., - - CADDOA, COL.

High Grade Holstein Calves

This is the ideal time of year to start them and have them ready for pasture next spring. ⅞ pure-bred Holstein calves, $20 and $25 each. Ship C. O. D. if you wish. Safe arrival and satisfaction guaranteed. Everything in the line of registered heifers. Write your wants.

ELM GROVE STOCK FARM,
Box 253. Cortland, N. Y.

Ernella Farm

OFFERS

17 - Females - 17

Six mature cows, 2 to 6 years old, fresh and bred to a 37.14-lb. son of King Segis Champion and a 27-lb. son of King Pontiac Hengerveld Fayne, the $100,000 bull recently purchased by Cold Stream Farms. Eleven yearling heifers, well bred, well grown and nicely marked.

Herd under State and Federal supervision. Bargain prices.

E. S. RACE, - BELVIDERE, N. J.

What Kind of Tires does the Thinking Farmer want

FARMERS are too busy getting results these days to pay much attention to selling talk

The tire that has nothing to show by way of performance, other than the mere desire of some dealer to dispose of it, has a harder time getting by with them than it ever had.

Revere Tires have a record of *service* and *economy* that extends back to the day when the first Revere Tire was built.

A record based on the *ceaseless and unending care* which the Revere Rubber Company has taken to see that *all of its tires* live up to what thinking farmers expect of them.

Wherever you find a Revere Dealer, you find a man who is thinking more of what the farmer needs and expects than of how many tires he can dispose of.

Trusting in the *established* record of Revere Tires to bring him that repeating custom which is the basis of all good business.

If what you are looking for is a *reliable* tire—a tire that *delivers economy* not sometimes only, but *always*—not in one size alone, but *in all sizes*—you will do well to get in touch at once with the Revere Tire Dealer in your neighborhood.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Early Experience With Sunflower Silage

HOARD'S DAIRYMAN:—Nearly twenty years ago several Delaware County (New York) dairymen became interested in the combination silage of corn and sunflowers. While this silage gave very universal satisfaction, it soon was discontinued for the pure corn silage for the following reasons: 1st, sunflower seed became scarce and hard to get and rather expensive for large fields of the silage; 2nd, the harvesting of the combined crop was very hard. Sunflowers in full head for cutting as silage are very top-heavy, and corn for silage is very heavy at the bottom of the stalk. The result is that the combined crop is very difficult to handle, as one tips one way and the other the other way when being picked up in the field for loading. It is thus a rather slow and hard crop to harvest, and the big heads are also difficult to run through a cutter with corn. Some of the dairymen overcame some of this difficulty in harvesting by planting the crops separate in the fields, and when filling silos they cut alternate loads of the two crops. The handling was better and results from silage the same. In the last fifteen years little has been grown here.

Youngs, N. Y. O. F. S.

Under normal conditions the best time to cut corn for silage is when the kernels are well dented, and about one-fourth of the husks and the lower leaves are drying up. Mature corn has a greater nutritive value and will make better silage than too green corn, providing it contains enough moisture to insure good fermentation. The best guide as t time of cutting under unfavorable conditions is when the corn ceases to grow.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

Two things make me as mad as a roost full of wet hens—one is to watch an infernal big black crow just waiting until I go back in the house, and the other is the sight of a fat rat in the corn crib.

Vacation Time

"Going to leave the farm and go on a vacation after the crops are all in?"

"Yep."

"How long you going to be away?"

"Two weeks longer than usual, I know I'll be that much happier and better satisfied when I return."

"Healthy out here in the country, isn't it?"

"Well, I'm not so sure. Grandpa Egbert passed away last Friday, and he was still a young man."

"What was his age?"

"Oh, he was only ninety-seven. But I guess he got sort of careless on wet days when he went for th' cows."

Home Once More

Home once more—and heart beats high,
Pulse is like a leaping mare.
There's a new joy in the sky,
Peace is round me, everywhere.
At the sharp turn of the road,
On the hill I stand and look,
Down to little clumps of trees,
Softly stirring in the breeze,
And a vagrant, fretful brook.

Home once more—I see the smoke,
Rising upward, and the field,
See dim forms o' farmin' folk,
In God's golden sun revealed.
Red roads winding off and on,
Lanes where herds are won't to go,
Silo, gleaming in the light,
And the face of earth is bright,
Ah! I knew it would be so!

Home once more—a thousand years
Must have passed since yesterday!
In between, the doubts and tears,
Cities—heartaches—grim dismay!
Now, there in the valley's lap,
Home smiles up at me, and I
Feel the quick, glad leap of bliss,
Feel a farmer-mother's kiss,
Underneath the unspoiled sky!

It makes me smile every time I see a city feller turn up his nose at sight of farms and farmers. I know how soon he'd turn up his toes to the daisies if both of them should suddenly stop.

The Farm Hand that Succeeds

He is kind to animals because he loves them.

He wants to see the farm make good.

He works by the sun, not a clock.

He is as kind to cows as he would be to women.

He is patient with young farm lads.

He never stops until a job is done.

He sees the almost holy side of soil.

He cultivates his mind while he cultivates the ground.

He finally marries a country girl
And
He lives happily forever after.

All life is like a county fair; everybody can't expect to win a cup or a blue ribbon, but we can at least have lots of folks pass and admire us for the good qualities we possess.

A great many tributes have been paid to milk, but we'd like to see one written by a six-month-old baby. Then you'd have a document worth keeping.

A New

De Laval

Cream Separator

Quickly pays for itself in these times of high butterfat prices and scarcity of labor. It does so doubly quick if your present separator is too small, half-worn-out, or you have none at all.

The De Laval Separator skims cleaner, is easier to turn and wash, and lasts longer—that is why there are more De Lavals in use than all other makes combined.

The De Laval is the World's Standard Separator.

A De Laval purchased now will pay for itself before Spring.

See the nearest De Laval local agent at once, or write the nearest De Laval office below for any information desired.

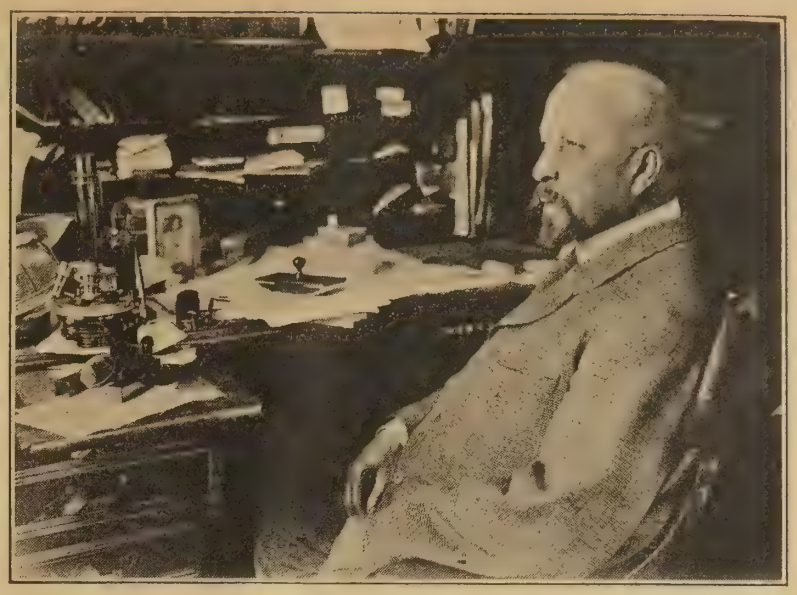
Uncle Sam's Hired Men Who Serve You

Dr. L. O. Howard, Chief of the Bureau of Entomology, Veteran Campaigner Against Bugs, Probably Saves American Farmers a Billion Dollars a Year

DIXON MERRITT



This is the second of a series of articles prepared by the United States Department of Agriculture, and which we are publishing at the request of Secretary Meredith, to acquaint our readers with the type of men who are making possible the wonderful service the Department is rendering and stands ready to render our readers, that those not now availing themselves of these services may do so.—Editor.

HALF a billion dollars a year is a pretty big estimate to put on the value of a man's services, but Dr. L. O. Howard, chief of the Bureau of Entomology of the United States Department of Agriculture, is worth that to the farmers of the United States. That is my estimate. Estimates from different sources vary. Dr. Howard himself, a conservative man and modest, is inclined to put it at about a hundred million. Here is the basis of my own estimate: Insects annually destroy about 10 per cent of the possible production of crops in the United States. If it were not for the general use of remedies found by the Bureau of Entomology, the loss would be 20 per cent. The difference between 10 per cent and 20 per cent of the crops of the United States is a billion dollars, easily. Then, just to be conservative, I cut that in half, and call it the annual value of Dr. Howard's services.

You see I am using "Dr. Howard" and "the Bureau of Entomology" as interchangeable terms. That is not scientifically accurate and Dr. Howard would object to it, but all the other people in the Bureau would be inclined to let it pass. He has been there so long—42 years—and has been so closely associated with all the work of protecting farmers against insects that one is justified in thinking of the bureau in terms of Howard.

The people who work with him say that Dr. Howard is the most exacting man in the world—with himself. With everybody else he is almost the opposite, they say. His men must get results, but Howard does not waste any time quibbling over methods. And yet, perhaps, there is a good deal of method in that trait of his. It has the effect of encouraging personality, of developing men who do things more effectively by impressing their individuality on the work. Somebody said of Dr. Howard a good many years ago that his work had less of academic assumption than any other scientific bureau in the government. Dogma finds no place in his thought. He does not believe that it is any of any man's business how any other man thinks.

When Dr. Howard came to the Department of Agriculture 42 years ago, economic entomology was not sure of its social position among the sciences. Other sciences looked upon it askance. Men were inclined to feel that entomologists partook of the diminutive nature of the creatures they study. That is not true now and has not been true for a good many years. Dr. Howard says, modestly, that he has "probably helped the appreciation of economic entomology as a scientifically based thing among other scientific men." Other scientific men say that Dr. Howard, by his work in the Department of Agriculture, has been the dominating force in making economic entomology a great science and recognized as such.

DR. L. O. HOWARD, CHIEF, BUREAU OF ENTOMOLOGY, U. S. DEPARTMENT OF AGRICULTURE

I suspect, however, that the value of the science is not yet thoroughly understood by people generally. Let me point out a few things that have been accomplished by one of Dr. Howard's specialties—the study of the parasites of insect pests.

The fluted or white scale of California was inflicting tremendous injury upon the citrus-fruit industry. The Department of Agriculture introduced from the Orient a lady-bird beetle, a natural enemy of the scale. The result was the speedy reduction of scale to negligible numbers and the saving of the citrus industry of the Pacific Coast.

Nearly 50 years ago, an instructor at Harvard had a fad for moths. Entomology was not his work, but he was playing at it. He had imported a number of moths and caterpillars from Europe. A storm destroyed his netting enclosure and liberated some of the caterpillars. Twenty years later, the gypsy moth progeny of some of those escaped caterpillars having increased unnoticed till that time, appeared as a pest and threatened the destruction of orchard, shade, ornamental and forest trees. The plague spread to Maine, New Hampshire, Rhode Island, and Connecticut. The states and the federal government began a campaign of control. Dr. Howard made several trips to Eu-

(Continued on page 168)

FEED FLIGHTS AND PROTEIN

A. C. McCANDLISH, IOWA

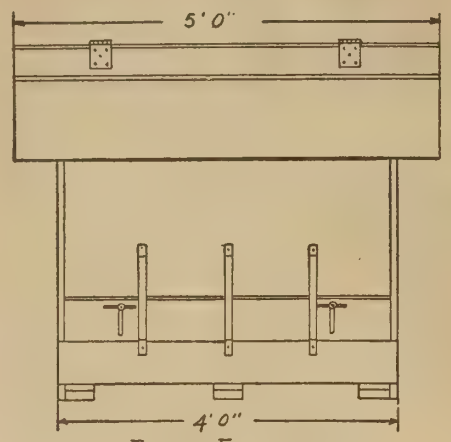
TWO years ago the limits of $20 and $40 per ton included the prices of practically all the common feeds used on the farm. But now if the upper limit be doubled it will not reach the height which some feed prices have attained within the last few months. This means that the dairy farmer has to exercise greater care than ever before in the selection of the concentrates he purchases to supplement his home-grown feeds.

The farmer of the Middle West is independent of the rest of the world except for one thing: he grows all the feeds he needs but his high-protein concentrates. Consequently, he should aim to produce as much protein as possible on the farm with a view to limiting the amount he will have to purchase and in buying feeds he should see that he uses the most economical source of protein available.

The dairy cow for maximum production needs a liberal ration containing large amounts of protein and one of the easiest and cheapest ways of providing some of this protein is by means of a home grown legume hay—alfalfa or clover. Such a roughage will not necessarily reduce appreciably the amount of grain that a cow will require for production but it will aid in minimizing the amount of protein needed in the grain ration.

In purchasing protein concentrates it should be kept in mind that digestible protein is the material desired and the prices paid should to a large extent be in accordance with the amount of protein supplied by the feed.

All protein feeds contain carbohydrates and fats but the necessity of purchasing these is not great as they can be produced cheaply on the dairy farm. Allowance for their presence in a concentrate must be made however. A convenient method is to allow one dollar per hundred pounds for the digestible carbohydrates and two dollars and a quarter per hundred pounds for the digestible fats in a feed and charge the rest of the cost to the digestible protein. This is not allowing as much as might be considered an equitable value for the carbohydrates and fats but it is useful for comparative purposes. In this way the cost of each hundred pounds of digestible protein in any of the common concentrates can be obtained and the accompanying table has been prepared in this way.



COST PER 100 LBS. OF DIGESTIBLE CRUDE PROTEIN IN CONCENTRATES AT VARIOUS PRICES

Cost per ton	$32	$38	$42	$44	$50	$54	$56	$60	$62	$66	$68
	COST PER 100 LBS. OF DIGESTIBLE CRUDE PROTEIN										
Feeds											
Corn, whole	$10.91	$14.91	$17.57	$18.91	$22.91	$25.57	$26.91	$29.57	$30.91	$33.57	$34.91

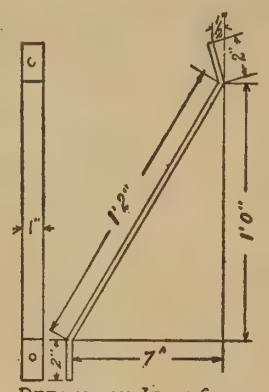
Barley	9.96	13.29	15.51	16.62	19.96	22.18	23.29	25.51	26.62	28.84	29.96
Malt sprouts	5.40	6.88	7.87	8.36	9.84	10.82	11.32	12.30	12.79	13.78	14.27
Brewers dried grains	5.39	6.78	7.71	8.18	9.58	10.50	10.97	11.90	12.36	13.29	13.76
Cottonseed meal	3.21	4.02	4.56	4.83	5.64	6.18	6.45	6.99	7.26	7.80	8.07
Cold-pressed cottonseed (cake)	5.22	6.64	7.59	8.07	9.49	10.44	10.91	11.86	12.33	13.28	13.75
Linseed oil meal (O. P.)	3.72	4.71	5.37	5.71	6.70	7.36	7.69	8.35	8.69	9.35	9.68
Cowpea	5.31	6.86	7.89	8.40	9.95	10.98	11.49	12.53	13.04	14.07	14.59
Field pea	5.41	6.99	8.04	8.57	10.15	11.20	11.73	12.78	13.31	14.36	14.88
Soy bean	3.41	4.39	5.04	5.37	6.35	7.00	7.32	7.97	8.30	8.95	9.28
Distillers dried grains (corn)	4.17	5.51	6.41	6.85	8.19	9.08	9.53	10.42	10.87	11.76	12.21
Distillers dried grains (rye)	7.88	10.09	11.56	12.29	14.50	15.96	16.71	18.18	18.91	20.38	21.12



As an illustration of the use of the table it may be noted that when wheat bran is costing $36, oil meal (O. P.) $64, and cottonseed meal $70 per ton, the respective costs of 100 lbs. of digestible crude protein in the three feeds are $10.53, $9.02, and $8.34. The prices used have been chosen arbitrarily to demonstrate that the feed purchased at the lowest cost per ton is not necessarily the cheapest source of protein. In this case the reverse is true.

When the price of a feed is known the table can be used to determine the cost of protein in the feed but it should be remembered that this proceeding has certain limitations. Some concentrates such as hominy feed are not purchased for the protein they contain, but for the energy supplying carbohydrates and fats they provide and so they can not be properly evaluated in this way. Again, in some cases, cottonseed meal would be the wrong feed to use even if it provided protein at a lower cost than did oil meal. Oil meal is a safe feed under all conditions but cottonseed meal can not be satisfactorily used where there is no succulence such as silage or roots in the ration. On the whole, however, it may be said that the main nutrient the corn belt dairy farmer has to purchase is protein and he should get his protein as economically as possible.

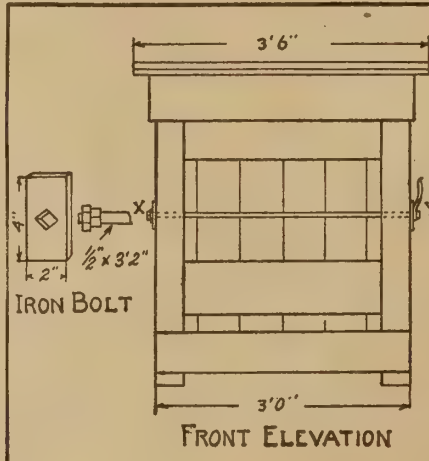
THREE COMPARTMENT, TWO-WAY SELF-FEEDER

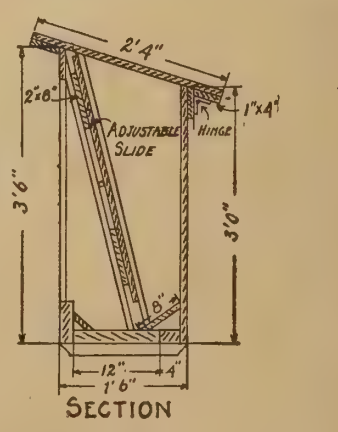
SELF-FEEDING growing and fattening pigs saves time, labor, feed, and therefore money. A self-feeder is simply a box or hopper so constructed that when filled with grain or other dry concentrates it will feed down into a trough and keep a certain amount of the grain before the hogs at all times.

Less labor required. Instead of making a young farm lad carry heavy swill pails in slopping the hogs two or three times a day, try filling a self-feeder, which can be done handily from a wagon, once or twice a week. The pigs can be cared for this way in less than half the time that it takes for hand feeding. Then, too, the pigs can be fed out on good clover pasture, far removed from the farmstead and free from the microbes and parasites in the dust of the hog-lot. It is necessary to see daily that the self-feeder is delivering the feed to the trough. Bulky feeds and ground feeds tend to clog in the hopper and need to be poked down, which is a simple matter and requires practically no extra work, as a good pig-man inspects his herd each day anyway.



More rapid gains and earlier market. Self-fed pigs make more rapid gains than when hand fed, requiring a shorter time to reach a marketable weight, thus saving labor and also getting the pigs on an earlier market, which is generally higher.

Cheaper gains. The younger a pig is the less feed he requires to make a hundred pounds gain. Consequently, since a self-fed pig is pushed harder, he usually gains faster, matures younger, and requires less feed for each hundred pounds gain, thus making cheaper pork. This has been proven by actual experiments.



Where plenty of skimmilk or buttermilk is available there is no need to purchase tankage or oil meal. Merely self-feed corn or ground barley and in addition feed enough of the dairy by-products by hand twice a day to balance the ration.

Points of a good self-feeder. It should be cheap, durable, weather tight, roomy, easy to construct, easily regulated for different kinds of feeds, and so built as to feed into the trough with but very little clogging of the feed. The trough should be so constructed that it is impossible for feed to be thrown out by the pigs.

FEEDING AND CARING FOR SWINE

THE Wisconsin College of Agriculture passed out at last year's state fair a bulletin, entitled "More Pork for Wisconsin", the authors being F. L. Morrison, G. Bohstedt, and M. H. Scott. This bulletin is so well filled with the meat of the best methods of feeding and care of swine that it should have wider circulation than one state. In consideration of this we present the major portion of this bulletin to the readers of Hoard's Dairyman:

Perhaps the most important essential to real success in the hog game is the proper feed, care, and management of the brood sow. Unless she is given the proper attention, large and thrifty litters can not be expected. The feed and care from breeding time to the weaning of the pigs is of especial importance. It is during this most important stage of their development that Mrs. Hog will do all in her power to make the "little future porkers" strong and thrifty, if we but give her a chance by seeing that she gets:

1. The right kind of feed—especially plenty of protein and mineral matter.
2. The right amount of feed—not fattening.
3. Plenty of exercise.
4. Comfortable quarters—dry, ventilated, well lighted.
5. No sudden changes of feed.
6. No rough treatment.
7. Freedom from worms, lice, and constipation.

How to Produce More Pork

1. Feed and care for your brood sows right.

2. Use pasture crops for all classes of swine throughout the growing season.

3. Have self-feeders, use them, and use them right.

4. Grind your barley and feed it to hogs.

Feed Clover or Alfalfa in Winter

It is very important that during pregnancy and the suckling period we feed the sow plenty of protein-rich feeds such as skimmilk, buttermilk, or tankage, and plenty of mineral matter which is contained in the above protein feeds and especially in the pasture crops. These feeds are the muscle and bone builders and are absolutely essential if we want strong, thrifty pigs that will make economical gains after they are weaned. We cannot over-emphasize the importance of feeding alfalfa or clover hay in racks to the sows during the winter months. It takes the place of pasture in the winter when the latter is not available, in furnishing bulk and additional protein, mineral matter, and vitamines. Roots, too, are fed to good advantage during the winter, as they provide succulence and are laxative.

Brood sows should not be allowed to become fat but should be kept in good, thrifty condition. From breeding to farrowing time (114 days), we should feed enough to cause yearling and older sows to gain about 70 lbs., while gilts should gain from 80 to 100 lbs. during this period.

The following are good rations for pregnant sows in winter:

(1). 94 lbs. corn, fed on ear.
6 lbs. tankage.
Alfalfa or clover hay in rack.

(2). 96 lbs. ground barley.
4 lbs. tankage.
Alfalfa or clover hay in rack.

(3). 35 lbs. ground barley or corn.
30 lbs. ground oats.
30 lbs. middlings.
5 lbs. tankage.
Alfalfa or clover hay in rack.

(4). 70 lbs. ground barley or corn.
25 lbs. chopped alfalfa hay.
5 lbs. tankage.

The above mixtures may be fed either dry or in thick slop. There is, on the whole, no advantage in slop over dry feeding.

In trials at the College of Agriculture during the past three winters, no ration has excelled No. 1. We simply feed one-fourth to one-third pound of tankage per head daily in a trough, and enough ear corn to keep the sows in good condition. This is usually 4 to 6 lbs. a head daily. In addition they have all the alfalfa or clover hay they want in a rack. Roots can be fed along with this ration to advantage, saving corn.

If other protein-rich feeds are substituted for tankage in the above mixtures it should be in the following proportion: 1 pound of tankage is equivalent to 2 lbs. of linseed oil meal, 15 lbs. of skimmilk or buttermilk, or 30 lbs. of whey.

Make the sow take exercise for it is necessary for her own health as well as to produce a strong litter. It is often advisable to shut her out of the shed during the middle of the day for a couple of hours and to feed her some distance from her sleeping quarters. Keep the sow free from lice and worms, and avoid constipation.

At Farrowing Time

Four or five days before a sow is due to farrow (this is best told by keeping a record of breeding) separate her from the rest of the herd, put her in the farrowing pen so that she will become accustomed to it before farrowing, allow her exercise daily, and be sure that her bowels are in a laxative condition. Some bran and oil meal in a slop as a part of her ration will aid in preventing constipation and also in avoiding a feverish condition of the sow after farrowing. If it is necessary to resort to a purgative, 3 or 4 ounces of Epsom salts will loosen her bowels. The two adjacent sides of the pen in the corner where the sow makes her nest should be supplied with fenders, that is, 2 by 8's bracketed to the sides about 8 or 9 inches from the floor. This is to furnish a refuge for the newly born piglot so they will not be squeezed against the wall nor lain on by the mother.

At farrowing time be sure the bedding is fresh and clean, not too long and not too much of it—better too little than too much. It is well to spray the pen with a good coal tar disinfectant once or twice a week—this to prevent white scours in the pigs. Also avoid sudden changing of the sow's feed for this will produce sickness and scours in the pigs.

If the sow is restless at farrowing time the pigs should be put in a warm basket as they arrive and after all are born and the sow is quiet, carefully place them, one at a time, at teats. This should be done as soon as possible.

For the first 24 hours after farrowing give the sow no food, but be sure that she gets all the lukewarm water she will drink.

It is advisable to cut the wolf teeth of the pigs close to the gums by means of nippers which will tend to keep the sow quieter and prevent the pigs scratching each other up in fighting.

Feed Mixtures After Farrowing

It takes about 10 days to get the sow on full feed after farrowing. It must be done slowly and the feed increased only gradually. After 10 days or two weeks give the sow all she will clean up three times a day. The following mixtures are good for suckling sows:

(1). 40 lbs. ground barley or corn.
20 lbs. middlings.
30 lbs. ground oats.
6 lbs. tankage.
4 lbs. chopped alfalfa.

(2). 50 lbs. ground barley or corn.
35 lbs. middlings.
10 lbs. oil meal.
5 lbs. tankage.

(3). 50 lbs. ground barley, corn, or oats.
50 lbs. middlings.
Fed with sweet skimmilk or buttermilk.

Plenty of exercise is essential at this time for both sow and litter. It keeps the pigs from becoming too fat and developing thumps which kills and stunts large numbers of pigs every year. Get the sows and litters out on pasture as early as possible. Bluegrass is good for early pasture. It is well to have a creep for the little pigs where they can be fed separately, after two or three weeks old, ground barley, cracked corn, and tankage. Fresh skimmilk is much better for the little fellows than tankage and will surely make them grow.

Castration is done with best results when pigs are about 6 weeks old; that is, about two weeks before weaning. At weaning time the sow's ration should be limited so as to prevent udder trouble. It may be necessary to turn the pigs in for a few minutes every other day for awhile.

It is well to start self feeding the pigs in their creep long before they are weaned. They will scarcely miss their mother, especially if a little fresh skimmilk can be given them at this time. You can feed ground barley or corn and tankage or oil meal in separate compartments of a self-feeder, and be sure and have the pigs on good pasture.

After the sows have dried up, the ones that for any reason are not desirable mothers for next year's crop will be culled out and fed for market, preferably in self-feeders on pasture. Those that will be kept over will be run on pasture with enough concentrates to keep them thrifty. Make them rustle for forage during the summer—the exercise is good for them.

GROWING PIGS WILL MAKE GOOD USE OF PASTURE AND WILL MAKE CHEAPER GAINS ON PASTURE THAN THOSE KEPT IN A DRY LOT

Pasture Crops for Hogs

Pasture crops reduce the cost of pork production 20 per cent. Good pasture for all pigs throughout the growing season (from early spring till late fall) is of the greatest importance. Not only do pigs make cheaper gains, but the green succulent feed and the exercise they obtain aid greatly in keeping them thrifty and in good condition.

Another advantage in having hogs on pasture is the fact that the manure is evenly distributed over the field and none wasted as is the case when pigs are fed in dry lot.

To study the actual advantage in dollars and cents, of feeding hogs on pasture as compared with dry-lot feeding, and to find the comparative values of the various pasture crops for Southern Wisconsin, trials have been carried on at the College of Agriculture for the past there years. In these trials the pigs have been fed from a weight of about 50 lbs. until they reached market weights of 200 to 225 lbs.

The table on this page illustrates the advantage of pasture over dry-lot feeding. It is a comparison of a lot self-fed corn and tankage on rape pasture with the same combination of feeds fed in dry lot. The average results for three consecutive years are given.

The "no pasture pigs" made fair gains, for they were fed the excellent combination of corn and tankage. But the more fortunate ones getting rape pasture in addition gained considerably faster and required 52 lbs. less corn and 20 lbs. less expensive tankage for each 100 lbs. gain. On rape pasture the return per acre over the cost of corn and tankage was $99.21 with feeds and pork at the average prices during the three years but at 1918 prices the return per acre was $147.06. Even though fed the excellent ration of corn and tankage the "no pasture" pigs returned but $53.19 over the cost of the corn and tankage at average prices for the three years, or $75.95 at 1918 prices.

Comparing the returns from the pigs on rape pasture with those having no pasture, we find that an acre of rape was worth $46.02 at average prices for the three years and $72.01 with feeds and pork at 1918 price.

(Continued on page 180)

Pasture vs. No Pasture, Average of 3 Years

	Average daily gain	Feed for 100 lbs. gain		Return per acre over cost of corn and tankage	
		Corn	Tankage	Av. prices	1918 prices
	lbs.	lbs.	lbs.		
Rape pasture	1.30	377	26	$99.21	$147.06
No pasture	1.06	429	46	53.19*	75.05*

*Return for same number of pigs as on an acre of rape.

Bull Selection and Management

C. O. LEVINE, IOWA

THERE is no animal more important on the dairy farm than the bull. He is at least half the herd; in that half the blood in every calf produced is his. In spite of this important fact, the head of the herd is often given the least attention of any one individual on the farm. The prevalent idea of many farmers seems to be that any old animal is good enough, just so that he is able to produce live calves.

If success is to be obtained in the dairy industry, there are certain fundamental factors that one must consider in selecting the animal which shall largely determine the future producing capacity of the herd.

First of all is the question of breed. If the majority of cows in the herd contain a high per cent of blood of one of the dairy breeds the farmer should select a bull of the breed which his cows chiefly represent.

In localities where a certain dairy breed predominates, and seems to be the most popular for that particular locality, it is best to get a bull of that breed; and if the farmer does not already have good cows of that breed, several high grade cows of the same breed should be purchased. The dairy farmer will in time have surplus animals to sell, and, if he later secures pure-bred cows, he will have young bulls to sell. In the long run he will be better able to sell animals of the most popular breed than he will those less known.

It is comparatively easy to decide on the breed, but finding the right individual animal is often a difficult problem.

First of all, the bull should be healthy, growthy, and have a strong constitution which is indicated by heart girth. We don't want a sickly, runty, slab-sided individual at any price, no matter what his pedigree shows. If the animal under consideration is some distance away, and time does not permit a journey to see the bull, insist on getting a photograph of the animal. While the photograph will not take the place of the animal himself in determining his physical make-up, it does give some indication of what the animal is.

Careful consideration must be given to the breeding of the bull. The pedigree in itself means but little. It is what the pedigree tells about the near relatives of the bull that is of importance. If the sire of the bull under consideration is out of a cow with a good production record, or the sire himself has sired heifers that have developed into good producers, and the dam is a good producer, and out of good producing ancestors, the chances are that the animal will himself be a producer of heifers that will develop into good milkers.

Another problem for the farmer who is inexperienced in buying breeding stock is the age of the bull. Shall he buy a young, untried bull, or shall he buy an older bull whose breeding qualities are pretty well known? If a good mature bull, that is known to be a producer of good cows, can be secured at a reasonable price, the mature bull is generally to be preferred.

The price to pay for a bull is another problem to consider. Sometimes good, young, untried bulls with high producing ancestry can be procured at a very reasonable price. Sometimes the reverse is true, as is shown by recent sales where untried animals have sold for amounts running up into the sixth figure. As a rule, a farmer just beginning to build up his herd with good dairy sires, and who has no pure-bred females, should not pay more than $500 for a bull. Good bull calves around six months, with good producing parents, can sometimes be purchased at from two to five hundred dollars each.

Tuberculosis and contagious abortion are two diseases to guard against in buying a bull. Always demand an official certificate, showing that the bull is free from tuberculosis. The certificate should show that the bull has been tested for tuberculosis within the past year. It is best to buy with the understanding that if the bull reacts to the tuberculous retest within six months, that he is to be returned, and the money paid for the bull as well as the shipping charges refunded.

Contagious abortion is a difficult thing to deal with. About the only safeguard against it a man has in buying a bull is to note if there are many young calves in the herd to which the bull under consideration belongs. The calves will testify, at least, that the disease is not very common in the herd.

The above precautions should always be taken into consideration in buying either males or females to be added to the herd.

Lack of size and potency in bulls is often due to improper care and feeding. The bull should be handled fearlessly, but never carelessly. He should never be teased. Teasing develops a fighting spirit in the bull.

When six months old, the bull should be separated from the heifers and cows of the herd, as sexual development often begins at about this age.

When six to ten months old, a copper or cannon-metal ring, about two inches in diameter, should be placed in the bull's nose. This ring should be replaced by a ring three inches in diameter when the bull is mature. Self piercing rings are the easiest to insert, and should be used, if possible. For inserting other styles, a hole is made in the septum of the nose with a knife, trocar and canula, or a punch, and the ring passed through the hole and screwed shut. The ring should be examined from time to time for wear. When it shows some wear, it should be replaced with a new ring.

Unless it is the intention to show the animal, it is best to remove the horns. The best time to do this is when the ring is placed in his nose, or when he is about a year old. It can best be done with dehorning clippers. Care should be taken to cut the horns close to the head, removing about one-fourth inch of hide and hair with the horns, or they will grow again. The dehorning should be done in the fall or spring of the year, when the weather is cool, and there are few flies.

Inserting a ring in the bull's nose, and removing his horns, checks the developing meanness in him, does not reduce his breeding powers, and makes him a safer animal to handle, although even a well rung and dehorned bull should never be trusted.

The dairy bull is best managed when kept in a lot of from one-fifth to one acre in area. At one end of the lot should be built a bull shed. which can be closed when it is desired to catch the bull. A good arrangement is to have two rooms in the shed, separated by a heavy plank partition. One room is for the bull when he is in out of the weather, or eating, and the other room is for storing hay or grain. With this arrangement the bull can be safely fed, and when it is desired to catch him it can be done by locking him in the shed and catching him from the safe side of the partition. In catching the bull while in the shed, we have found it convenient to use a stiff wire about five feet long, bent at the end to form a hook, which is hooked through the ring in the bull's nose.

After all, the bull should have plenty of exercise if he is to be virile and potent. Exercise is best provided by setting a post about ten feet high in some convenient place in the pen or, better still, along the side of the pen, with an arm extending out three or four feet into the pen. At the end of the arm, a chunk of wood about a foot in diameter is hung about four feet above the ground. The post should be braced with a guy wire on the outside of the pen. The bull will amuse himself by butting the chunk of wood, and in so doing will get the necessary exercise.

In leading the bull, it should always be done with a bull staff attached to the nose ring. In addition it is well to have a strap attached to the ring.

Feeding the bull is an important item. The bull should not be too fat, but should be kept in good condition, with liberal feeding of the proper kind of feed. Alfalfa or clover hay makes a good roughage. Much silage should not be fed. Heavy feeding of silage tends to develop pot-bellies in bulls which decrease their potency. Fifteen to eighteen pounds a day should be the limit of this feed. Grain to the extent of four to eight pounds a day, depending on the size of the animal, should be fed. A good grain ration consists of two parts ground corn, two parts ground oats, and one part oil meal. A good grain mixture for a cow producing milk is a good grain mixture for the bull.

The bull is old enough for service when he is nine or ten months old. Up to one year, he should not be allowed to serve more than five or six

PONDEROSA GRACE PIETERTJE ORMSBY, WISCONSIN STATE CHAMPION
4-YEAR-OLD HOLSTEIN COW

SPILLED MILK IS MONEY LOST

The Non-Spill Sanitary Dairy Pail is safe. When it is knocked over, the seal valve closes the opening and stops the milk waste. A closely woven brass sieve strains the milk as it goes into the pail and keeps out the dirt. The milk stays clean.

The pail is sanitary and easy to wash. All inside seams and rivets are soldered smooth. There are no crevices in which dust or contaminating substances can collect. Every part can be taken out, cleaned and scalded. This pail carries out the splendid sanitary principles of the United States Food Administration.

These sanitary safeguards may mean the difference between health and sickness to your family. If you sell milk, these purity features of the Non-Spill Sanitary Dairy Pail mean dollars in your pocket.

Your local dealer sells it or will get it for you. It's a Schlueter metal product.

Dealers: Write for our special proposition. Your customers will want Non-Spill Sanitary Dairy Pails.

Non-Spill Sanitary Dairy Pail Co.
4636 N. Broadway : St. Louis

BIG CROPS ASSURED IN WESTERN CANADA

Need of Farm Labor Urgently Required for Harvest

Rains of the past week, which have been general throughout all portions of Western Canada, covering **Manitoba, Saskatchewan** and **Alberta**, have placed beyond all manner of doubt the certainty of vast grain crops throughout the entire district.

Reports from all points indicate marvelous and rapid growth. The conditions of a week or so back, which were decidedly less promising and led many to think there might be a partial failure, have disappeared altogether and now there is a wave of optimism circulating throughout the entire country.

In 1915 there were enormous yields reported from all parts, and it would appear now as if in many places the yields of 1915 would be equaled if not beaten.

What might appear to be a drawback is the apparent shortage of farm help. The Province of Manitoba, through its Employment Bureau in Winnipeg, is asking for 10,000 harvest hands and over, offering from $5 to $6 per day. The Province of Saskatchewan is asking for 15,000 extra hands, to take care of the immense harvest that is certain to be reaped in that Province. In Alberta the crop area is somewhat less, the labor conditions somewhat better, and a request is being made for 5,000 extra farm hands.

Interviewing the officials of the different Governments, they are inclined to the opinion that as the crops in Kansas, Nebraska, South Dakota, Illinois and other Central States are harvested, there will be a movement northward that will materially help to take care of the labor situation. With the low railroad rates that may be secured on application to the Employment Office at Winnipeg and at boundary points, or which may be secured through the Canadian Government Offices at Chicago, Ill.; Detroit, Mich.; Milwaukee, Wis.; Kansas City, Mo.; Omaha, Neb.; Des Moines, Iowa; Watertown, S. D.; St. Paul, Minn., and Grand Forks, N. D., will give to those seeking employment the opportunity to reach the harvest fields at a low cost.

Newly Invented SAW RIG

Low introductory offer puts this new saw-rig within reach of all, at small part of cost of other rigs. Saws your winter's wood in few hours. Powerful 4-cycle motor. Easy to operate, light to move. 30 days' trial to prove our claims. 10-year guarantee. Send today for FREE BOOK of FACTS.

Pat. Appl'd For

OTTAWA MFG. CO., 1141 Main St., Ottawa, Kans.

cows, and service should be very limited up to fifteen months of age. Up to two years of age, the bull should not be required to serve more than twenty to twenty-five cows. After the bull has reached two years of age, unlimited service may be practiced to a certain extent. Fifty to sixty cows is all a mature bull should be required to serve in one year, with never more than two services a day, or six to eight in one week.

For small or restless cows, it is best to use a breeding rack. In case of a small bull and large cow, a hole may be dug for the hind feet of the cow.

The mistake in small herds of selling the bull before the production capacity of his heifers is known too frequently occurs. Early disposal of the bull is usually due to the farmer not wishing to practice inbreeding to the extent of mating the bull to the bull's own offspring. Where a farmer has a neighbor who has a good bull of the same breed, and who also does not wish to inbreed, the situation is met by exchanging bulls. In this way, young bulls, with good producing parents, can be conveniently kept until their production ability has been tested. Many bulls have been sacrificed at butcher prices, while, if they had been kept a year or two longer, or long enough for their heifers to show their milking capacity, they would have been worth five to fifteen or more times their value for meat.

Butter Prices for July

From the daily quotations of the United States Bureau of Markets, we have compiled the following table giving the monthly averages of the daily wholesale prices for July, 1919 and 1920 on 92 score butter (extras) at the four principal markets, together with the total receipts of butter at these markets:

	Ave. price July 1920	July 1919	Receipts July 1920	July 1919
	cents	cents	tubs	tubs
Chicago	55.00	51.52	355,749	328,359
New York	56.72	53.20	283,110	311,522
Boston	58.07	54.84	183,941	192,647
Philadelphia	57.49	54.06	76,000	67,017
Total			898,800	889,545

During July, butter maintained about the same average that it did for June, with practically the same total receipts. As compared with a year ago, the receipts for the month are slightly larger but the total receipts for the seven months ending July 31 are nearly a million tubs under that of the like period during 1919. The total receipts for the first 7 months of 1920 were 3,809,859 tubs as compared with 4,729,855 tubs during the first 7 months of 1919.

Ninety score butter averaged 52.58c for July on the Chicago market with centralizer butter at this market selling for 54.46c, or at a premium of 2c a pound. Jobbers' prices on extras sold to retailers during July were 56.49c in Chicago and 59.40c in New York.

California Milk Prices Rise

HOARD'S DAIRYMAN:—The Housewives' Leagues of California have been unable to stay the proposed raise of prices in milk. On August 1st, the price to the consumer went up to the following:

Pasteurized milk—Pints, 10 cents; quarts, 16 cents; 1½ quarts, 24 cents; 4 quarts or over, 15 cents per quart.

Certified milk—Pints, 16 cents; quarts, 25 cents.

Table cream—¼ pint, 12 cents; ½ pint, 23 cents; 1 pint, 45 cents.

Pastry cream—¼ pint, 15 cents; ½ pint, 28 cents; 1 pint, 55 cents.

With the inauguration of the new schedule, the distributors have also announced the discontinuance of all discounts for cash or payment in advance.

The above prices are for the East Bay cities; it is reported that prices in San Francisco will be the same except that the price per quart will be 17 cents.

The distributors state that the raise in price is necessary because of a corresponding raise made by the producers. The producers say the raise is necessary because of the high price of feed, especially alfalfa.

The State Market Director was asked to investigate the situation and he has issued a lengthy statement in which appears the list of dairies that have sold off their herds because at the present price of feed it was no longer profitable to keep them. The list comprises eleven dairies supplying San Francisco, their daily shipment aggregating close to 5,000 gallons.

Regarding the price received by the dairymen for their cattle, the statement says: "Because of feed and labor conditions so many dairymen have been selling off their herds that there has been a material reduction in the price at which milk cows can be bought; the auctioneers who handle cattle sales state that from 15 to 20 per cent of the dairy cows sold by them have gone to the butcher's block."

It was also pointed out that the cost of alfalfa, due to crop shortage, has increased from around $9 in 1914 to from $28 to $33 today. Labor has increased from a gross cost of $65 per month in 1914 to $140 at present. In addition to this, all overhead expenses have increased proportionately.

Regarding the price of alfalfa, the Alfalfa Growers of California, Inc., have issued a statement which is a strong argument against growers raising the price of alfalfa further, but in which appears the following significant paragraph:

"As far as it is possible to judge from the general condition at this time it is probable that the comparatively short alfalfa crop this year will lead to further advances in price between now and winter."

Oakland, Cal. L. L. D.

— WORK —

EVERYBODY complains of the high cost of living. Everybody knows the remedy. What is it? Work. The trouble is, everybody wants the other fellow to do the work. As certain as 2 and 2 make 4, we can't work a 6-hour day and live on the products of an 8-hour work day and keep it up.

To be sure, if we are willing to wear our old clothes until they drop off, and if we are willing to do without butter, meat, and sugar, we can get along very well on a 6-hour work day. If we are willing to live in tents, we can get along on a 3-hour work day and if we are willing to live in the trees, we needn't work at all.

But that isn't the American way of doing things. I believe the American people are going to wake up pretty soon and go to work, and when they do, our country will become rich, not in shoddy cloth and inflated currency, but in real, honest, genuine wealth.—J. C. McDOWELL.

Pail Balancing Scale

Direct to $4.55 You For

JUST the thing to determine the yield of each cow. Especially popular with cream handlers who weigh the cream as collected at the different farms.

On the dial of this scale is a loose indicator which can be adjusted and set by a thumb screw, at the O mark so as to balance the weight of the pail. Thus, the net weight of the milk is shown.

For the Dairyman Whose Herd Is His Fortune

CIRCLE A Cork Brick are neither a fad nor a luxury. They are a practical, common-sense means for protecting the health, enhancing the comfort and increasing the milk production of dairy cows.

Any dairyman whose main source of income is his herd, and who keeps an accurate account of each animal's performance—can soon convince himself of the ability of Circle A Cork Brick to pay a real profit. All he needs to do is pave a few stalls with cork brick and, after they have been down a reasonable time, compare the records of the cows stabled on them with the records made before the brick were installed. Not only will there be a noticeable increase in milk production, but disease will be less prevalent and accidents less frequent.

Because of the distinctive qualities of the materials from which they are made—ground cork and refined asphalt—Circle A Cork Brick are warm to the touch, yielding to the tread, non-slippery, durable and sanitary.

Send for a copy of the 28-page illustrated book, "Better Stall Floors." It contains a wealth of information that may prove valuable to you.

Getting Every Drop

WHEN you milk a cow you make it a point to get every drop of milk—to milk her as dry as possible. But after you have done this, do you try as diligently to get every drop of cream from the milk?

Skimming the milk clean is just as important as milking the cow dry. To do the latter successfully requires a pair of experienced hands; to accomplish the former to the best advantage requires a

Primrose Cream Separator

The Primrose saves every drop of cream. It is the only separator with two wide open cream outlets, unobstructed by a cream screw. The regulating screw is in the *skimmilk outlet.* It is easy to adjust because it works on the large volume of skimmilk instead of the small volume of cream.

Ask your nearby International agent about Primrose and — let us mail you illustrated catalog.

Where Farming Is Profitable

Farm lands in the South have not been boosted by speculation. Why buy a farm in a high-priced section and cripple your future with debt when you can buy a better farm in the South for one-third the price? Don't you want a farm where climatic and soil conditions are unexcelled? It is our business to help you find just what you want. We know Southern lands and land values and it is to our interest to locate you where you will succeed and make business for the railroad. There is no charge for our service. For full information call on, or write to J. C. Williams, Manager, Southern Railway Development Service, 1302 Pennsylvania Ave., Washington, D. C.

KING SEGIS PATENT LOCK

Ear Tags, Bull Staff and Rings.

Two Blades of Grass Where One Grew Before

A. E. LINDQUIST, ILLINOIS

A WELL known leader in agriculture recently admonished the farmer "Not to trust entirely to the Lord to make our pastures grow but to put some thought and work on them ourselves," which is something we have not done to date. Indications, however, are that we are finally awakening to the fact that instead of being a potential asset, our pastures may be made one of our most valuable pieces of farm land. In place of requiring four acres to carry one animal a year, as it now does in New England, or five acres to carry three head in Illinois where pastures are a bit more efficient, we should be able to make each pasture acre support one animal per year. In Europe one-half an acre is made to feed one animal, while at present the average for the entire United States is only one animal to every three acres.

It has been estimated that an acre of pasture will replace the following amounts of feed, based on 1918 prices: May $4.40, June $6.05, July $6.34, August $6.25, September $6.90, and October $7.63; a total of $31.36 annually. It is apparent that if these amounts are anywhere near correct, the pasture is worthy of considerable attention.

Poor grasses and weeds may be eliminated and clover and good grasses substituted, by the simple measure of providing plenty plant foods on which the latter thrive, in form available for their roots, instead of providing nothing and thus favoring the growth of weeds and wire grass.

From 1910 to 1916 a study was made of the effects of different ratios of ammonia, phosphoric acid, and potash on the pasture grasses at the Pennsylvania Experiment Station. At the beginning of the experiment, the grasses were in the following proportion: 50% wire grass or Canada blue grass, 30% Kentucky grass, and 20% timothy. After the experiment had progressed for six years, another examination of the pasture grasses showed that instead of there being 30% wire grass, there was not any but in its stead the valuable white and red clovers, while the other 50% was principally blue grass with a trace of timothy. This experiment also showed that nitrogen in fertilizers increases the growth of grasses and stimulates the growth of Kentucky blue grass, while potash and phosphoric acid tend to bring back clovers. From this we can draw the following conclusion: In the meadow, high ammonia fertilizers are best, whereas in the pastures where we usually wish to stimulate the growth of clovers, fertilizers high in phosphoric acid and potash should be used.

Mr. J. W. Weston, Michigan, tells of applying 300 lbs. of acid phosphate on a three-year-old meadow and leaving untreated strips for comparison. The treated portion of the field yielded 1½ tons per acre while the untreated portion gave only one-half a ton per acre. On another farm in the same county, acid phosphate was applied at the rate of 200 lbs. per acre on one-half of a 10-acre pasture. The treated section yielded 2 tons per acre while the untreated gave only one-half as much. The average value of clover and tmothy last year was about $24 a ton and prairie grasses brought about $18 a ton, so it is readily evident that the money invested in fertilizer returned a splendid dividend.

Back in 1913, the Virginia State Experiment Station, working in co-operation with the United States Department of Agriculture, took an old limestone pasture—one which had not been plowed for at least twenty years—and divided it up into plots of 2½ acres each. These were laid out in pairs. One of each pair received fertility treatment, the other did not. The animals were allowed to run for two weeks on one plot, then weighed and transferred to the other. Two weeks later the operation was reversed. By this simple system it was possible to make a record of the gain in live weight per acre on fertilized and unfertilized pasture.

The use of 300 lbs. of acid phosphate per acre, applied three times in five years, produced the best results.

Field to the right received no fertilizer, the clover yield for 1919 being 1.45 tons per acre. Field to the left received an application of limestone and acid phosphate, the clover yield for 1919 being 2.68 tons per acre.
Courtesy Iowa Experiment Station

The average annual gain in weight due to the use of this fertilizer was 158 lbs. If we figure acid phosphate spread on pasture as costing the farmer one and a half cents a pound—which, by the way, is in excess of its actual cost—the live weight increase produced by fertlizers cost the farmer less than two and one-fourth cents per pound. At this rate fertilizer on pasture produced live-weight gains far cheaper than can be produced in any other way.

From the experiments above and others of similar nature, pasture experts recommend the application of 200 to 400 lbs. per acre of the following fertilizers as top-dressing (it is preferable to apply this in the spring):

For grasses		For clover, alfalfa, and pasture
5—7—2	sand	0—12—4
6—8—0	loam	0—12—2
6—8—0	clay	0—16—0

The change in vegetation from weeds and poor grasses to clovers and good grasses may be somewhat slow, but the results of the application of fertilizer can often be seen within 48 hours after it is washed into the soil. The color of the grass changes. The sickly yellowish green color is replaced by a deep dark, thrifty green and growth begins at once. The root growth is stimulated and as a result the plant can use more of the plant food in the soil than before because of this greater root system.

Jersey Cattle Notes

For week ending July 30:

Number of animals registered: Bulls, 404; cows, 866; total, 1,270. Number of transfers recorded: Bulls, 248; cows, 843; total, 1091.

Tuberculosis in Hogs Increases

Some interesting observations have been made by the Veterinary Science Department in regard to the occurrence of tuberculosis in hogs. A farmer living in Oregon, Dane County, reported he had lost from November to March, 17 hogs in a drove of 45. A sick pig brought to the laboratory for examination showed generalized tuberculosis. A survey of the farm showed that the pigs after weaning had been fed skimmed milk separated on the farm, ground feed, and corn, but had been allowed to follow the dairy cattle during the winter. Fourteen animals were slaughtered. Lesions of tuberculosis were found in 12. The lesions were so extensive in four animals that they were considered by the federal inspectors as unfit for food.

The cows on the farm were tested. Eight out of 17 reacted, four of which were so extensively diseased as to be condemned as unfit for food.

Statistical evidence is constantly accumulating which shows that tuberculosis of hogs is on the increase. The data collected by the federal meat inspectors show that the ratio of tubercular to healthy hogs is three times as great as in 1911. The percentage of tubercular hogs at those abattoirs which draw their supplies from dairy districts is far greater than at those drawing their supplies from areas where hogs are not fed skimmilk or whey or allowed to follow feeding cattle, as is shown in the following figures collected by one of the large packing companies:

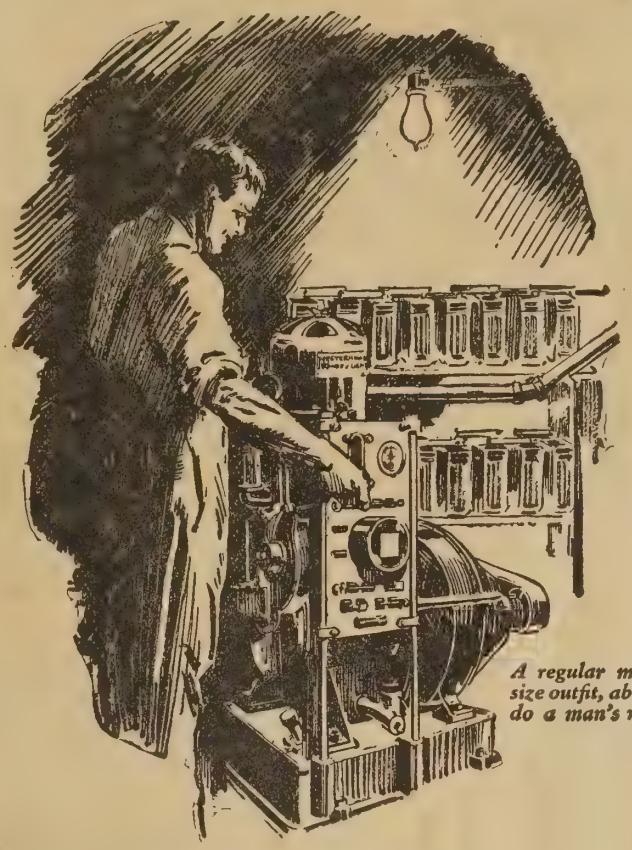
	%		%
Milwaukee	24.3	Denver	3.1
Chicago	14.3	St. Louis	2.0
Omaha	9.4	Ft. Worth	0.8
St. Paul	5.4		

When 9 per cent of the 40,000,000 hogs slaughtered show the presence of this disease, and 2 per cent of those slaughtered at Milwaukee are used only for grease, it would seem that it is time that this drain on our resources is grappled with heroically. This disease places an enormous tax on the meat-consuming public. When the burden is thrown back on the producer of hogs, as it should be, for he is in position to check this loss almost entirely by the use of methods known to be effective, he will bestir himself in the eradication of tuberculosis of hogs as well as the disease in cattle with which it is so closely related.

The pasteurization of whey is one phase of this work which every farmer feeding whey should forward as much as possible by seeing to it that the factory of which he is a patron pasteurizes its whey in an efficient manner.—Wisconsin Bulletin 302.

Marsh Soils Need Potash Fertilizers

"Potash and corn must go hand in hand on our marsh soils if we are to get profitable returns," says Griffith Richards of the soils department, University of Wisconsin.



"Last year trials with different fertilizers on the university marsh showed that the addition of potash alone more than doubled the yield of corn, and was nearly equal in value to heavy applications of manure. With no fertilizers, the yield of corn was 34.5 bushels an acre; with the addition of 200 pounds of muriate of potash, 78.6 bushels; and with the addition of 12 tons of manure, 83.5 bushels. Thus the experiment showed that the application of 200 pounds of potash at a cost of about $15 an acre gave an increased yield of 44 bushels. Valuing the corn at $1.80 a bushel the increased returns were $79.20, which means a net profit of $64.20 an acre from the use of potash alone.

"Manure was seen to give good yields, but where we have both marsh and upland soils on the same farm it will be more profitable for the farmer to use the manure on the uplands and get potash for the marsh. Manures contain much nitrogen that is not needed by peat soils but which is usually very deficient in upland soils.

"Other trials on the marsh show that mixed fertilizers, containing one per cent nitrogen, eight per cent phosphorus, and two per cent potash and applied at the rate of 125 pounds to the acre, yielded only 41 bushels of corn an acre. Potash and phosphorus mixed and applied at rate of 200 pounds potash and 400 pounds phosphorus gave a yield of only 71 bushels an acre or less than was obtained by use of potash alone. Thus phosphorus is not needed on our marsh now.

"The results obtained on the university marsh," continues Mr. Griffith, "will apply to most marsh soils in southern Wisconsin, for it is typical of the marsh soils of this region. The marsh is a deep peat, not very well decomposed, and neutral in character. Thus if we are to increase our corn yields on our marsh soils in southern Wisconsin, potash fertilizers must be used."

"How a new kind of farm hand added acres to my farm"

A regular man's size outfit, able to do a man's work

Editor's Note: *W. E. Shetrone, a farmer near LeRaysville, Pa., shows how you can help to solve your labor problem.*

"Now, I'm not going to tell you that the Western Electric Power and Light Outfit is the best on the market. The chances are you know more about farm plants than I do. All I want is to tell how this outfit has been doing a man's work on my place—when men are hard to get. That is how it saved time enough for me to cultivate seven acres more last spring."

W. E. Shetrone
LeRaysville, Pa.

Mr. Shetrone's house is pleasantly located

"LAST YEAR I was struggling along with my little farm—milking by hand, taking a two-hour trip to the creamery every day, working hard to support my family. Then a salesman showed me how I could do the work in less time and with less effort by installing Western Electric Power and Light equipment. Well, I put the apparatus in, and right from the start it began to save time and labor. In fact, the time it saved me made it possible to plow seven acres more last spring.*

A powerful outfit for heavy work

"Power ought to be the first consideration in buying a farm plant. There are plenty of good electric sets satisfactory for lighting. But not many of them are strong on power. You can't expect them to do the hard work.

"The Western Electric has a three horsepower engine, which as you know is ample to run most all the machinery. Grindstone, feed-mixer, churn, mill—you can operate them all together from a shafting hitched up to this powerful engine, because there's a pulley on it for just such work.

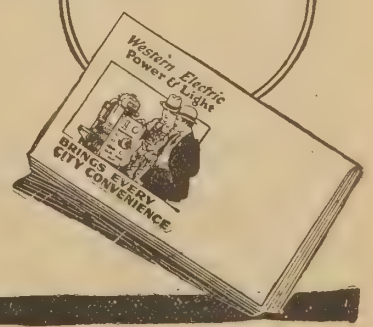
"In generator and battery too, power is the feature that impressed me most. My Western Electric outfit furnishes plenty of electricity to light the house and barn, and at the same time it runs the pump, the milking machine and such household appliances as a vacuum cleaner and a washing machine.

Why the battery lasts longer

"Another big feature is the automatic control of the battery charge. At the start the current flows in at a fairly high rate, but as the batteries fill, the rate of flow becomes less and less—till at last the current is just trickling in. Then it stops by itself. This 'tapering charge' takes the strain off the batteries and *so makes them last longer.*

"Well, the Western Electric outfit certainly has helped me in my work. And talk about time saved! Those extra seven acres I was able to plow will produce some handsome profits this fall, I can tell you."

**What the Western Electric Power and Light Outfit did to make Mr. Shetrone's farm more productive, it can do for your farm too.*



A portable motor drives the grindstone

How to save time and labor

Booklet H. D. 4 gives some facts and figures on how the Western Electric Power and Light Outfit helps solve the farm labor problem. For your copy write to the Western Electric Company at Chicago, or 195 Broadway, New York.

Are You Getting All the Milk She Can Produce?

As long as a cow gives down a fairly good flow of milk you may think she is producing to her full capacity. But is she? A cow is a wonderful milk-making machine, but she must be properly fed to produce a good profit for her owner.

International Special Dairy Feed

Makes Good Business Cows

International Special Dairy Feed is made of high grade materials, each one of which contains certain elements necessary to the general good body condition of the animal. These ingredients are scientifically mixed in just the right proportions to produce the desired results —the most milk, the best condition and longest life.

Feed With Summer Pasture

Grass stimulates the milk flow but has no sound basis for building the body and maintaining milk flows at capacity indefinitely. Feed International Special Dairy feed with summer pasture and see how big milk flows can be maintained all year round.

Every cow in your herd must earn her board and a profit for you or go to "beef." Start feeding International Special Dairy Feed now and give the poorest cow in the herd a chance to make good. Start with a trial ton *at once*. Order from your dealer today. If no International dealer is near you, write us and we will see that you are supplied promptly.

INTERNATIONAL SUGAR FEED CO.

Do You Know How Much Your Milk Will Bring Per 100 Pounds of Grain Ration?

If you receive only $2.50 a hundred for your milk and the good BUFFALO CORN GLUTEN FEED grain mixture you feed costs you four dollars or less a hundred pounds — you are getting $7.50 to $10 worth of milk per 100 lbs. of the *Buffalo Corn Gluten Feed* mixture fed to good milkers.

In some sections, June milk ranged as high as $3.83 per hundred. At this price, a seventy-five-dollar ton of good BUFFALO CORN GLUTEN FEED grain mixture, properly fed with good roughage to good cows, produces $225 to $300 worth of milk—6,000 to 8,000 lbs.

Good feeding of good cows always pays. The better the feeding, the better the pay.

But good feeding cannot be done without *good* feed. BUFFALO CORN GLUTEN FEED is *the feed*—the high-protein concentrate—that makes the profitable milk yield.

Your dealer should have BUFFALO CORN GLUTEN FEED. If he does not, write us, giving his name.

Corn Products Refining Co.
New York MAKERS OF Chicago
BUFFALO CORN GLUTEN FEED

A Successful Oklahoma Dairyman

"This Is a Special Business I Have Worked Up"

CLARENCE ROBERTS, OKLAHOMA

THERE'S a dairyman near Oklahoma City, Oklahoma, who sells all the milk he produces for 25, 30, and 35 cents a quart. Milk from other dairies around Oklahoma City sells for 15 to 17 cents a quart. This man, E. C. Smith, gets 25 cents a quart for milk on the side of the city nearest his home, 30 cents through the center of the city, and 35 on the opposite side.

He does not own a "model" dairy. He has no expensive equipment. He has proven conclusively that the best quality of milk can be produced with ordinary farm equipment. His barn has a board floor and simple stalls such as are found in any farmer's barn; no stanchions of any kind. The cows are tied with halters. They eat out of boxes or half-bushel measures.

In the milk house is a home-made ice box that holds 400 pounds of ice, a galvanized iron sterilizer made to order at a cost of $40, a small work table, a sink with running water, a gasoline stove, and a gasoline engine hitched to a well around which the milk house is built.

This is all the equipment that Smith uses to produce his high quality of milk. He built the milk house, dug the well, and installed all the equipment for $400. These are all the improvements he added to the farm when he bought it. The barn was built for a horse barn. He has used it for a cow barn without any changes.

Smith keeps eight to ten Jersey cows. Ten is his limit. He does all his own work with some help from his wife. Eight hours is his usual day's work—never more than ten. He makes one delivery a day, in the morning.

He milks from seven to nine cows all the time. He has one or two come fresh at a time, at different times of the year. This gives him a constant supply of milk for his trade. He sells around 60 quarts a day, at an average price of 30 cents a quart.

Smith gets this price because his milk is clean. No other reason. Every so often the city chemist makes examinations of all milk sold in Oklahoma City. Smith's milk has often shown the lowest of that sold in the city. It generally runs between 1,000 and 3,000 bacteria per c. c. It has run as low as 700. He never neglects to call the attention of his customers to the official count. Needless to say, his customers are his best advertisers.

Smith does not produce certified milk. City regulations do not provide for certified milk. It is the aim of the city officials to secure a supply of milk of good quality for the whole city, rather than encourage the production of high-quality milk for a few people.

About half the milk Smith sells is bought by people who have bottle babies. The other half is bought by people who are willing to pay the price to put the best milk on their tables.

Here's the routine under which Smith works. It gives the how and why of the extra clean milk that he produces. Around 6:30 in the morning the cows are let in the barn, except the few mornings they remain there over night in the coldest winter. They are first thoroughly brushed off.

LADY C OF MARA ALVA, GUERNSEY HEIFER WHICH FRESHENED AT 2 YEARS, 13 DAYS, AND FOR HER FIRST 30 DAYS ON TEST PRODUCED 1,195.1 LBS. MILK, 42.42 LBS. FAT

Her best day's milking was 45.8 lbs. She is owned by Thurman Miller, Ohio. Mrs. Miller and two junior partners are shown holding her.

Then, with a bucket of hot water, washing powder, and rag, Smith washes the cows' udders—not merely wipes them. Special attention is given the openings in the ends of the teats. The udders are then wiped dry with a clean cloth which is used for this purpose but once after being washed. During this time the cows are eating their morning feed.

The cows cleaned off, Smith changes into a clean suit and eats breakfast. Breakfast over, he and his wife do the milking. They wait until breakfast is over in order to give time for the dust from the feed to settle. The first two or three draws from each teat are discarded. This cleans out the milk ducts. Covered pails are used, the milk passing through a strainer into the bucket. As soon as a bucket is filled it is at once taken into the milk house and bottled.

As soon as the milking is over the barn is cleaned out. A conscientious job is done. The board floor is scraped clean. Then air-slacked lime is sprinkled over the floor. It is swept into every crack and crevice. This purifies the barn and gives it a sweet smell. The barn is filled with lime dust and the flies are literally killed. The barn is cleaned out in this manner twice every day.

Let's get back to the bottling of the milk.

From the milk buckets the milk is poured directly into the bottles. The bottles are set in ice water. As soon as the morning milking is over the bottles of milk are put in the cases and packed with ice. The night's milk

goes into the ice box and is delivered at the same time next morning.

The steam sterilizer previously spoken of is a box made of sheet iron with a tight top, four feet long, three feet high, and two and one-half feet wide. In the bottom are two inches of water. Above the water are two racks, one above the other, on which the milk vessels are placed. The sterilizer sets on a three-burner gasoline stove.

Twice a day every bottle and vessel which touch the milk are placed in this sterilizer. The stove is lighted and the water boiled for 15 to 20 minutes. The sterilizer is filled with steam which reaches 200 degrees F. The milk vessels stay in this sterilizer until next milking. Smith places the highest value on this sterilizer. He says it is the greatest secret of his success in producing clean milk.

Smith loves his cows. Everyone is a pet. They get the best of feed. He feeds his cows in good milk flow two pounds of bran, a pint of cottonseed meal, a half pint of corn meal, and a half pint of peanut hearts. This is fed twice a day. The cows get alfalfa and oat hay, such as they will clean up at each meal.

Until eight years ago Smith was a city man. As he wanted to live in the country, he bought 10 acres of land two miles from the edge of town. He bought a cow for the use of him and his wife. As he continued to hold his position in town, he told his friends of the fine milk and delicious butter he and his wife enjoyed. Friends in town asked for any milk he had to spare. He sold a few quarts a day at an extra price.

The milk sold from this one cow paid for her feed. He and his wife figured that if one cow would do so well, more would do likewise. More cows were bought. With six cows he found he was assured a sufficient income for a living. He gave up his position paying $2,700 to stay with the cows. Since then he has bought another ten acres. He had all to learn. He tried out many suggestions that failed. He believes he has now worked out all the requirements that go to make up clean, pure milk. They are:

Milk from a clean cow in a clean barn milked by a clean milker into a clean bucket and at once bottled in clean bottles in a clean milk house and immediately cooled. Sounds easy, but takes work. In this case it pays well. Figure 60 quarts a day at 30 cents a quart, which is $18 a day, or $480 a month. His feed bills run around $125 a month.

"This is a special business I have worked up," Smith said. "But don't think I have it cornered. There is room around Oklahoma City for 20 more dairymen just like me."

Dairy Courses at Iowa State College

The six-months course in dairying begins this year September 27th. Men who have completed the eighth grade of the public school may enter for this course. It is preferred that the students have had some practical creamery experience although this is not required. The course is composed of two three-month terms and one who has had sufficient practical experience may remain for only a three-month term.

This course fits a person for a position as buttermaker, ice cream maker, cheesemaker, or operator of a market milk plant. Fifty-three students were this year registered in the six-months dairy course. These men have been placed at salaries ranging from $900 to $1,800 per year with an average of $1,445 per year. There is an unlimited demand for men who make good as operators of dairy plants. This department receives from one to more calls for such men daily.

The four-year course in dairying begins September 27th. Men who are graduates from accredited high schools may enter in that course. The eleven graduates from the four-year course this year were placed before graduation at salaries ranging from $1,800 to $3,900 per year with an average of $2,258 per year. Of these men four are engaged in work as teachers in agricultural colleges, one of them being placed in charge of the dairy department of the University of South Africa. One is a state dairy inspector, while six engaged in commercial work.

The ten-day course in dairying for experienced operators begins January 3, 1921, and is intended only for men who have had several years' experience as operators of dairy plants.

For further information address M. Mortenson, Dairy Department, Iowa State College, Ames, Iowa.

According to reports received by A. J. McGuire, Minnesota College of Agriculture, patrons of Minnesota cheese factories received 69.3 cents per pound fat in April and 65.7 cents in May.

Three reasons for cultivation: Downing the weeds, loosening the soil, saving moisture.

Twenty-dollars Cash Brings You this JIM DANDY MIXER!

YOU can't afford to mix by the old fashioned, expensive, back-breaking shovel method.

You can't afford to pay three men's wages to do the mixing that one man will do with this Jim Dandy.

You can't afford to be without the quick, cheap and perfectly mixed concrete that the Jim Dand will give you.

WRITE NOW

Drop us a post card this very minute and we will send you our latest illustrated circular completely describing the four models in which Jim Dandy Mixer is built and give you complete particulars about our special $20 offer.

EDITORIAL COMMENT

No person is fit to handle a bull unless he appreciates that the bull is dangerous and likely to turn upon his attendant at any moment. In the course of a year we read of a considerable number of deaths and many injuries through attacks of mad bulls. We now and then find a person who calmly and complacently informs us that his herd bull is perfectly gentle and can be trusted. This man has a lesson to learn and has not yet realized that no bull can be trusted. All bulls, whether they have a disposition to be cross or not, should be handled as though they were vicious. It is seldom that a vicious bull gets the better of his master. It is the one that "can be trusted". A man is foolish indeed to enter the yard or stall of a mature bull without being protected. A good dog will give this protection in the yard or pasture and about the barn the bull should be handled with a good staff. The bull stall should be so arranged that it is unnecessary for the attendant to expose himself to the bull. A man's a fool who does not fear a bull.

In the Weekly News Letter of the Department of Agriculture we find that through the efforts of dairy specialists, who have been carrying on educational campaigns in behalf of the food value of milk and its products for human food, large increases in the use of dairy products have taken place.

It has been reported by the president of the Milk Distributors' Association in Detroit that through an educational campaign the consumption of whole milk has increased in that city 10 per cent, butter 15 per cent, and cottage cheese 3 per cent. One Detroit distributing firm, since the campaign, has sold 20,000 more pounds of butter and 50,000 more quarts of milk weekly than it did before the educational work on the value of dairy products was done.

This increase in the consumption of dairy products shows how effective judicious advertising is and what an important part it plays in the building of an industry. If it is wise for other manufacturers to advertise their wares, it is equally important that the dairyman advertise his product, especially when only a few people appreciate its importance and food value.

OUR CONDITIONS NOT SERIOUS

How busy many people have been trying to analyze and to solve our present industrial condition. After every great war the world has experienced similar situations, but they have never been so general because our last war was the greatest, the most far-reaching, the most terrible, the most costly the world has ever known.

Much of our trouble is purely imaginary. A country is not in a serious condition when it has an adequate food and clothing supply and where there is work for all. Two or three months ago and for some time following, manufacturers, merchants, and other business men were meeting quite regularly in the cities to discuss ways and means of securing a larger food supply. Reports have gone out to the effect that owing to the shortage of labor on the farms much land had been abandoned and there was danger of famine in this country.

It was the purpose of these meetings to plan ways and means of supplying labor to the farmers, a most worthy motive, in order that we should have an adequate amount of food. We were not concerned over the situation, for we did not see or could we gather from reliable sources evidence that indicated any considerable number of farms being left idle.

The recent report of the agricultural crops of the United States indicates that we will have more than the average crop this year. It is estimated that we shall have 809,000,000 bushels of wheat and for our seed and food supply we need 650,000,000 to 700,000,000 bushels. Besides, this, about July 1 we had over 300,000,00 of bushels of wheat from last year's crop. The corn crop promises to be above the average, the supply of dairy cattle is increasing, the hay crop is good.

Now that it is pretty certain that we shall have an adequate food supply some of these same men that were worrying about the shortage have begun to have meetings to determine ways and means of handling this crop and they look upon the situation as rather serious.

If we permit ourselves to brood over every human activity we can keep ourselves and all those that associate with us in a state of mind that will make ourselves and other people believe that we are on the road to oblivion and to everlasting smash-up. It is well enough at times to consider the business conditions of our country and crops and everything that goes to build successful industry and to supply our needs, but there is little to be gained if every change of condition is viewed with alarm. We must ever keep in mind that we are in the days of reconstruction and what is needed is a steady head and a steady hand. It would be expecting too much for any country that has been plunged in a great war and tremendous expense to recover its equilibrium and normal condition in the course of a year or two. It seems to us that the best service that can be rendered to this nation is by every man settling to his own job and doing efficient and effective work.

MEAT AND MILK

The efforts put forth to advise the consuming public of the importance of milk and its products are bearing fruit. Mr. Whisenand, in the Breeder's Gazette, takes exception to some of the statements made regarding the food value of milk and the amount that should be expended for milk as compared with meat and fish.

Mr. Whisenand does not agree with Dr. Sherman of Columbia University that only 12 per cent of the total expenditure for food should be spent for meat and fish and that 44 per cent should be spent for milk and dairy products. Dr. Sherman is in no way connected with the dairy industry but he has studied human diets and has come to the conclusion that people would be better off if they spent 12 per cent of their money for meat and fish and 44 per cent for milk and dairy products.

As a nation we are known as heavy consumers of meat and small consumers of milk and its products. Dietitians have pointed out that our people could feed themselves more economically and would be in better health if they consumed less meat and more milk. We do not infer nor do we hold that meat is not a wholesome and nutritious food and highly desirable in the human diet. It is a splendid food.

The comparisons in food value between milk and meat have been made by us frequently. It has not been our purpose to depreciate the importance of meat but rather to show the food value of milk and to point out that the nutrients in it are cheaper than in meat, and, further, that it is a more complete food than meat. It would be shortsighted on the part of the dairy industry if it attempted to prove that meat was not highly desirable, for at the present time the dairy industry contributes a large percentage of the meat supply of the nation and in the future it will be the most important source of our meat supply. The dairy cow is a more economical producer of human food than the steer and provides a more important food.

Mr. Whisenand states that a heifer is two to three years old before she reaches a productive age and at this time the beef animal is slaughtered. He forgets to state that most heifers will produce in one year as much food as one and one-half to two steers and, as a rule, begins milking when she is two years of age. In other words, when she is three years old, she has contributed as much food to humanity as one and one-half to two steers and she is still alive to repeat the operation the following year.

He criticizes the statement that milk is one of the cheapest foods. He says, "Five and two-thirds ounces of round steak contain as much protein as a quart of 4 per cent milk. At 40c per pound five and two-thirds ounces of steak cost 13½c. Protein is thus fully as cheap in round steak as in milk and is considerably cheaper in some of the lower priced meat cuts." He forgets that it requires 7 ounces of sirloin steak to furnish the protein of one quart of milk and that in the milk there are other foods quite as essential as protein, such as mineral matter, fat, and vitamines. Moreover the protein of milk is complete and protein of meat is incomplete. He further states, "A combination of protein and calories may be obtained as cheaply in meat, potatoes, and cereals as in milk, potatoes, and cereals, and the first makes a much more palatable combination."

To this it may be said that it depends upon the individual's taste. We bring no argument against roast beef, bread, and mashed potatoes as being a good foundation for a meal for a hungry man but we cannot agree that meat, potatoes, and cereals provide as complete and nourishing a ration as milk, potatoes, bread, and cereals. Dr. McCollum's investigation showed that by feeding a combination of meat, potatoes, beans, peas, and cereals to animals they were not properly nourished and did not make proper growth or show healthy condition and disease followed, but when the same foods were supplemented with milk, the animals grew properly and were healthy and vigorous.

Mr. Whisenand falls into the same error of building a diet that is so common and that dairymen are trying to show is an imperfect diet for human beings; that is, that meat, potatoes, and cereals provide a proper diet. These are all good foods but they lack something that is found in milk and is necessary for growth, reproduction, and health.

Cheese is a more nourishing and more complete food than meat and it should be looked upon as one of the cheap sources of protein, but we would not argue that it should be the only source. Mr. Whisenand suggests letting people balance their rations according to their tastes and cites experiments conducted by Professor Evvard with swine to demonstrate how successfully this may be done. Professor Evvard has been successful in feeding swine on this system but no experiments with a dairy cow have proved such a system of feeding a success, and if we are any judges of children and their propensities for eating the wrong things, we conclude that they would exercise mighty poor judgment in the selection of proper foods. Indeed, the free choice system for pigs does not work where there is a too great variety of feed.

One of the strongest arguments that we have for milk comes from those interested in raising beef. It is not uncommon for those who desire to show calves at fairs and expositions, to not only supply the calf with its own mother's milk but also provide a nurse cow. Mr. Whiseand will admit that it is possible to raise a the beef cow with its own mother's milk, but in order that a stockman may develop the best calf, he secures reinforcements from a nurse cow. Now if milk is so essential in the ration of the beef calf for its development, to give it the vigor, a sleek coat and proper growth, then why there should be any argument raised against a liberal allowance of milk in the human diet.

Preserving Home-made Cheese

Can you tell me how to keep worms out of home-made cream cheese? I tie it up in a flour sack and swat every fly I see, but they get ahead of me occasionally.

Trenton, Mo. H. S. C.

Professor J. L. Sammis, of the Cheese Department of the Wisconsin College of Agriculture, has given us the following reply to the above inquiry:

"Your subscriber's method of tying up each cheese in a flour sack is a good one to protect the cheese from flies.

"Home made cheese was formerly rubbed with grease on the surface before the days when paraffine came into use as a cheese coating. This cheese grease was often called 'fly proof'. It would probably be very difficult to get hold of any of

this old-fashioned cheese grease for home use at the present time, although some of the larger supply firms might be able to furnish it.

"It is of great importance, however, to take care when making the cheese that a perfect rind is obtained, having no cracks or openings of any sort. Then keep the cheese clean and protect it from flies. This can be done by keeping the cheese in a small, dark room which is not too frequently opened, such as a closet in the corner of the cellar, and a wire netting can be nailed over openings to insure ventilation and avoid flies and excessive dampness. The cheese should be turned over once a day when new to keep them from sticking to the shelves.

"The modern method of dipping cheese in paraffine, then putting them in boxes for storage is quite effective as a protection from flies, and also the modern method of storage in a refrigerator, where there are no flies at all. It is not much trouble to pour melted paraffine, at about 120° F., over the well dried cheese surface and thus coat it with paraffine."

Feed Grain on Pasture

Professor G. C. Humphrey of the Wisconsin College of Agriculture suggests that cows producing less than one pound of butterfat per day and that are in good condition will undoubtedly prove most profitable with pasture alone.

It has been suggested to feed the following named quantities of grain with abundant pasture for varying production:

Holstein or Ayrshire cows producing 30 lbs. of milk daily, 5 lbs. of grain; 40 lbs. of milk daily, 9 lbs. of grain; 50 lbs. of milk daily, 10 lbs. of grain.

Guernsey or Jersey cows producing 20 lbs. of milk daily, 3 lbs. of grain; 30 lbs. of milk daily, 6 lbs. of grain; 40 lbs. of milk daily, 10 lbs. of grain.

The following mixtures are suggested for summer feeding:

1. 100 lbs. ground oats, 100 lbs. wheat bran, 50 lbs. corn meal. This mixture contains 10% digestible protein. (On good pasture.)

2. 200 lbs. wheat bran, 200 lbs. corn meal, 50 lbs. oil meal. This mixture contains 12.5% digestible protein. (On fair pasture.)

3. 500 lbs. corn and cob meal, 200 lbs. oil meal. This mixture contains 15% digestible protein. (On dry summer pasture.)

Cottonseed or gluten meal are substitutes for oil meal. Hominy feed and ground barley are substitutes for corn meal. If these feeds are not available, good commercial mixed feeds may be purchased to good advantage for the best cows of the herd.—Wisconsin Testers' Monthly News Letter.

When to Cut Sunflowers

There seems to be quite a little difference in the opinion of men with experience as to the right time to cut sunflowers for ensilage. As we have this year about 10 acres, we would appreciate your valuable advice as to the right stage to ensile sunflowers.

Ridgefield, Wash. J. G.

The best time to cut sunflowers for silage is still a matter of considerable argument and uncertainty. This is partly due to the fact that in the sections in which they have been grown to the greatest extent, the growing season is rather short and the sunflowers will never mature. In these sections, however, it has been the practice to cut the sunflowers for silage when they are about 10 per cent to 25 per cent in bloom.

It is reasonable to expect that a somewhat more nutritious silage would be secured if the sunflowers were allowed to reach a greater maturity, say, when 80 per cent of the plants are in bloom and the most advanced heads have well developed seed. For the present, at least, it might be well to ensile the sunflowers when the majority of the seed is in the milk stage and the most advanced seed heads are commencing to get hard. From personal experience, we should judge that where sunflowers and corn are planted at the same time, the sunflowers will be best for ensiling some two weeks before the corn is ensiled

Wild Sunflowers for Silage

During the last few years there has been much written in the agricultural press and several experiments reported by experiment stations on the use of sunflowers for silage. The reports have mostly been on the large Russian sunflowers. The reports of the use of the Russian sunflowers led the Dairy Department of the Kansas State Agricultural College to consider the wild sunflower found so abundantly in Kansas as a silage crop. Large amounts of wild sunflowers have been put into silos along with corn and sorghum, and have never been objected to when feeding the silage.

In the fall of 1919 a perfect stand of wild sunflowers was found within hauling distance of the college. The sunflowers yielded 4 tons per acre. About 10 tons of sunflowers were put into a silo between layers of corn silage. A feeding trial was arranged using five cows, in which the cows were fed wild sunflower silage, alfalfa hay, and a grain mixture consisting of 4 parts of corn chop, 2 parts bran, and 1 part oil meal. The cows had previously received corn silage in addition to the hay and grain mentioned above. When changed to the sunflower silage they ate very sparingly of it from the start and did not become accustomed to it as we had expected. The cows decreased in milk production and lost in body weight. At the beginning of the experiment the cows averaged 1108 pounds in weight and were producing on an average of 12.1 pounds of milk each. After a 24-day trial the cows averaged 1042 pounds in body weight and were producing 8.7 pounds of milk each. This is a loss of 66 pounds per head in body weight and a decrease of 3.4 pounds of milk daily. In the absence of corn silage, the cows were changed to cane silage, and in the same period of time gained 25 pounds per head, and all but one cow increased in milk production. One cow's production had declined so low that it failed to return with the change of feed.

As the result of this feeding trial we have not considered wild sunflowers, when fed alone, a satisfactory crop for silage.

One factor that we believe to be important in making sunflower silage and which may account for the differences reported by users of sunflower silage is the time at which the crop is cut. The wild sunflowers mentioned above were cut when in full bloom and the stems were quite woody. If cut early, the stems would have been more tender and perhaps more palatable as a result.

We are not interested in wild sunflowers for silage when other crops can be raised for silage, but in many sections of the state, wild sunflowers are abundant when other crops fail, and if they can be made into a food for cattle by putting them into a silo, many of our farmers in Kansas and in other states of the Southwest will be greatly benefitted.—J. B. FITCH, Kansas College of Agriculture.

Cutting and Curing of Alfalfa Hay

HOARD'S DAIRYMAN:—In the July 23, 1920 issue of Hoard's Dairyman in the article headed "Curing Alfalfa for Dairy and Beef Cattle", written by George Stewart, Utah Experiment Station, you speak very favorably of putting the alfalfa into cocks very soon after cutting. Would it be safe to put the alfalfa into cocks the same day it is cut in the western part of Pennsylvania where we get many showers of rain especially during the first cutting, and how do you determine when it has stood in the cock long enough or about how many days should it stand in the cock? Is there any advantage in putting a ten-quart bucket of salt on each load of alfalfa after it is put in the mow?

Sewickley, Pa. A READER.

Professor L. F. Graber gives the following recommendations concerning the cutting and curing of alfalfa hay:

"No exact date can be given for the first, second, or third cuttings but a good indication to follow is the growth of the little shoots or sprouts originating at the crowns. When the field begins to bloom quite abundantly an examination at the base of the stems will show little sprouts that later produce the next crop. When these are very numerous and at least an inch in height, the cutting time is at hand if there is favorable curing weather. If not, harvesting can be delayed until fair weather occurs. Where the delay is not too long no injury to the stand or growth of the next crop will occur but only two cuttings may be obtained. This is less serious than the harm which accompanies cutting alfalfa too early and which often causes such a serious thinning of the stand that weeds and blue grass take possession of the field. Cutting too early may also result in a weak, short, yellow succeeding growth and a shorter-lived alfalfa field. Better have the first cutting too late than too early. Avoid close cutting. Leave a stubble of about two inches.

"In favorable seasons, three crops of alfalfa may be obtained, but as a protection against winterkilling the last crop should not be taken after September 10. On farms with large acreages only two cuttings are planned for, on account of the difficulty of cutting all the alfalfa at the right stage. With smaller acreages three cuttings can often be taken to good advantage.

"To get the best quality of hay, alfalfa should be cut on a day that promises to be fair. Do not, under any circumstances, plan to leave alfalfa cure in the swath like timothy. At least half the feeding value of alfalfa is in the leaves. With their thin and much exposed surfaces they dry out quickly, become brittle, and are lost in handling. To get alfalfa or clover hay cured uniformly and with the least loss of leaves the crop should not remain in the swath longer than is necessary to become well wilted. This may require four or five hours after cutting in hot dry weather, or one or more days if the weather is cool, damp, or cloudy. The wilted hay can be raked and bunched without serious loss of leaves into cocks of about 100 pounds each. Larger cocks may heat and mold in the center. Under no circumstances should alfalfa hay, damp with dew or rain, be bunched, raked, or stored. Outside moisture of this nature will invariably cause molding, or severe heating, or both.

"Given favorable drying weather alfalfa will be ready to store two days after bunching. In cool, damp weather the curing process may require a week, in which case the bunches may need to be moved in order to give the plants beneath a chance to grow. Canvas caps, while not so popular now as they used to be in the days of small alfalfa acreages and more abundant labor, are a wonderful protection against rain. An hour or so before loading the cocks should be spread apart and opened to the wind and sun to free the interior from any surplus moisture.

"The hay is then ready to be loaded with a drum hay loader or pitched by hand. With this method the brightest green hay is obtained with the least loss of leaves. The curing process which goes on in the bunches is uniform, since the life processes of the wilted plants continue and the moisture moves up the stems and is passed through the leaves. However, with the scarcity of farm labor, farmers having a considerable alfalfa acreage prefer to take risks on the weather for the sake of employing less hand labor and more rapid hay making machinery.

"One plan of alfalfa haying is to allow the cutting to wilt in the swath, after which it is raked in windrows with a side delivery rake. Here it is left to cure out thoroughly, but a few hours before loading with a hay loader the windrows are turned bottom side up with a side delivery to allow the hay next to the ground to dry out. If no rain occurs an excellent quality of green hay is secured. In the event of rain the windrows are turned several times after fair weather returns to permit thorough drying. This, of course, ruins the green color of the hay and, to some extent, its feeding value, but experience has demonstrated that alfalfa will stand much more rain than either timothy or clover and still make good hay.

"Alfalfa thoroughly cured in the field will maintain its bright green color when stored in the mow or stack. When it is stored while still a little green, the stems contain a considerable amount of plant juice and heating and fermentation occur in the stack, resulting in a very aromatic and palatable brown hay. It is sometimes advisable to store alfalfa before it is thoroughly cured, but as a precaution against excessive heating and molding it is well to ditsribute the hay at the time of storage over several bents in the barn, instead of piling it high in one mow.

"It must be remembered that it is positively dangerous to store any alfalfa hay if it contains moisture from dew or rain. Spontaneous combustion resulting in fires may occur, or, at the least, there may be a molding and charring which injures the feeding value of the hay. The interior moisture of the stems and leaves of ordinarily cured hay will not, as a rule, cause this difficulty. It is the outside moisture on the hay at the time of storing that is particularly dangerous."

The use of salt for curing or rather preserving legume hay dates back a great many years but there has never been any definite approval of this practice as being either beneficial or wise. Some theorists have claimed that it tends to preserve the hay from mold and is also a protection against spontaneous combustion. Similar claims are made for slaked lime but these have not been upheld by investigators. It is our own opinion that there is no practical advantage in adding salt for preserving either alfalfa hay or corn silage, for both of which puropses it is occasionally recommended. Indeed, we can see specific objection to it in that there may be a tendency to get more salt into the feed than the cow requires and that may be actually detrimental to her. This would hold particularly true if a sufficient amount of salt were added to really act as a preservative. Possibly the addition of ten quarts of salt to each load of alfalfa will not be detrimental but, in our opinion, it will be of no value and is unncessary expense.

Heavy Production of Linseed Meal

Most Mills Operating Full Capacity—Prices Down and Demand for Export Lacking

A large output of linseed meal is indicated by reports to the effect that the majority of linseed oil crushers are running full capacity at the present time because of the exceptional amount of linseed oil which they have on contract. This meal with its rich store of crude protein and slightly laxative oil is a healthful feed for limited use with all farm animals.

Lack of domestic flaxseed has made foreign importations necessary and receipts from Argentina were very large during the past few months. As reported in the July 10 issue of The Market Reporter, Duluth received six cargoes this season up to that date and actual holdings in that market were then around 500,000 bushels. Receipts in the East were equally heavy.

The principal mills report that they are well sold up for the summer months. The market for oil meal during March this year was unusually quiet for a time of the year when there is as a rule a good demand. This, together with the lack of export demand, caused the market to decline to a low level.

When, about the first of April, the market reached the low point of $57, f. o. b. Buffalo, for linseed meal in round lots for future shipment, large jobbers and dealers anticipated their requirements for the summer and fall demand. Since that time conditions have not improved as expected and, while the mill prices held firm, jobbers and dealers are offering at prices materially below those quoted by the mills.

Linseed meal can not be handled or carried as easily as some of the other feeding stuffs. First, because the majority of crushers do not have sufficient storage space and therefore must insist on shipping directions; and, secondly, because such shipments can not always be consigned to points where they can be conveniently stored and at the same time handled at the through rate when reshipped from warehouse.

It causes, therefore, no surprise that while Buffalo manufacturers and crushers located at other points are asking $62 per ton f. o. b. shipping point for both prompt and future shipments, several dealers are asking for bids, and are actually offering linseed meal at $60 per ton f. o. b. shipping points for prompt shipment.

The export demand which is relied upon to take care of the surplus accumulated did not materialize and if the expected improvement in the foreign exchange situation does not take place few exportations will be made. This may have a depressing effect on future prices. Probably no material advance in the price will take place during the summer months.

Conditions this year are dissimilar to other years. A few of the larger manufacturers state that the American farmer and the mixed feed manufacturer have come to realize more fully the value of linseed meal and that they expect that 95 per cent of the output of their mills will be consumed in this country, where as in the past, especially prior to the war, most of this product was shipped to Europe in the form of cake.—U. S. Bureau of Markets.

New York Butter Market

NEW YORK CITY, AUG. 10, 1920:—For the past two or three weeks, there has been a feeling of pessimism in the market. That feeling developed principally because of the slow absorption of the large quantities of Holland and Danish butter which arrived simultaneously some weeks ago. While it became known that little foreign butter would be received in this country during the next few months because of the fact that our domestic production was above normal, and there were evidences that it would continue so for an indefinite length of time, there was a feeling that daily receipts would not clear readily for some time to come. There is a different tone to the market at the present time. While there is yet an absence of snap a greater feeling of confidence prevails and it is felt that in the very near future the market will again be firm and active and values will again begin to advance. While the past week witnessed some decline in values the last one or two days has witnessed the reverse. It is generally felt that by Saturday of the present week prices will be considerably higher than they are at the present time.

Foreign butter still continues to arrive, but in relatively small quantities. During the past week, 3,500 casks of Danish butter were unloaded and 8,580 boxes of Argentine butter were placed on the market. An interesting letter, recently received by a local butter dealer from an authority in Denmark, states that little butter will be shipped from Denmark during August and September. The writer further states that the production of Danish butter is rapidly declining and that Norway and Sweden are paying prices of 58@60c for Danish butter at point of shipment. Germany is stated to be a heavy buyer of butter which is an additional fact tending to prove that little butter will be received from European countries during the months to come. It is very probable that this country will have little to supply the domestic demand for butter except our current make. That is a condition which would seem to assure a consistently high active market for the balance of the season. It can not be denied that there is a shortage of butter in this country, in fact there is a world shortage of butter. Undoubtedly there will be a curtailment of consumption, to some degree at least, in this country because of the tightening up of money with the unavoidable reduction of business activity which will result. However, those whose tastes have become educated to butter will continue to purchase it for table use so long as they find it possible to do so.

On last week Monday, extras were quoted at 55c. There was practically no demand and on Tuesday the quotation fell to 54@54¼c, and on Wednesday, the price went to 53¾@54c. The lower price resulted in greater activity and on Thursday trading became very active, the quotation becoming firmly established at 54c. There was no change on Friday and Saturday but the market seemed to be gathering momentum. On Monday, the strength of the market was sufficient to cause the price to advance to 54¼@54½c. Today, there was no change but it is apparent that there will be another advance in the near future. Practically all stores found prospective buyers eager to secure stocks of high quality butter and large quantities changed hands. The quality of butter is falling off greatly and it is difficult to find sufficient fancy butter to satisfy the demand. Foreign butter is moving to better advantage, the Holland butter selling at 52¾@53c, the Danish at 53@53½c, while the Argentine butter, which is of uniformly poor quality, is offering at 47c. Established quotations on domestic butter are: Extras (92 score), 54¼@54½c; higher scoring than extras (93 score or higher), 55@55½c; firsts (90—91 score), 53@54c; firsts (88—89 score), 51@52½c; and, seconds (83—87 score), 48@50c.

W. B. LIVERANCE.

Cheese Prices for July

Cheese prices again showed a decline during July, although the total receipts at Chicago, New York, Boston, and Philadelphia, since the first of the year were 14 million pounds under those of last year. The cold storage holdings on July 31st were over one million and a half pounds less than on the same date a year ago. On the basis of receipts of cheese and storage holdings, it is somewhat difficult to understand the decreased prices of cheese, although the July make itself is considerably in excess of what it was a year ago.

The daily quotations of the United States Bureau of Markets show the following average quotations on cheese (style, Twins) for three large markets for July, 1920 and 1919:

	Average price July, 1920	July, 1919
	cents	cents
Wisconsin boards	24.61	31.72
Chicago	24.67	31.58
New York	26.78	32.54

Longhorns averaged for July of this year, 25.55c on the Wisconsin Board, or nearly 1c over Twins. This was another reduction of ½c in price from the June average, making the July price 4c under the May average.

Index to Volume LIX

The index to Volume LIX of Hoard's Dairyman is now in print and ready for distribution. This covers the issues from January 23, 1920, to July 16, 1920, inclusive. It is prepared for those readers who preserve their copies for reference as an aid in readily discovering the particular information in this volume they may seek. A copy will be sent free upon request.

Mar. 29-30, 1921—Holsteins. Watertown Holstein Sales Co., Watertown, Wis. F. Darcey, Sec.

Producers' and Consumers' Interest in Milk Prices

C. P. WARBER, Manager National Milk Producers' Federation

IN asking for certain information relative to public control over the market distribution of fluid milk, a manager of one of the prominent producers' milk marketing associations of the United States recently wrote in part as follows: "Our constant trouble with the milk dealers on price adjustment convinces us that there should be some method by which prices and all other factors pertaining to the distribution of milk can be amicably adjusted from time to time by some impartial body with authority to enforce its regulations."

The present writer is aware of the fact that some of the largest milk producers' marketing associations are outspokenly opposed to any further extension of public control or regulation of the market milk business whether by municipal, state or federal government boards or commissions. The majority of farmers of certain sections of the United States, in common with business men and property holders in other industries, seem opposed on general grounds to the extension of governmental regulation of almost any kind of business. Governmental control and regulation of business is not in harmony with their theories or convictions in the realm of political science or practical politics. Besides such general considerations, however, the experience of many farmers with the activities of the United States Food Administration relative to milk prices during the war, caused them to form rather strong convictions regarding the efficacy and equitableness of governmental supervision of that kind of business; and those convictions are generally rather hostile towards the idea of increased governmental control in the market distribution of milk.

But, as already indicated in the beginning paragraph, this is by no means the unanimous opinion of organized milk producers' in all sections of the United States. For a considerable length of time after the United States' Food Administration ceased to function, various producers' associations, notably the New England Milk Producers' Association, the Inter-State Milk Producers' Association (supplying Philadelphia and several cities around it) and the Michigan Milk Producers' Association (supplying mainly the city of Detroit), voluntarily continued to formulate schedules of seasonal prices of milk, in conference with representatives of the public; variously designated as milk commissions or milk administrators. The functionings of such commissions and administrators were probably all "extra legal", i. e., they were without the sanction of either state or federal laws. But it is important that for a considerable number of months after the Food Administration ceased to function both the producers' associations and the leading milk dealers in those markets continued to abide by the decisions of such administrators or commissions.

One of the most successful examples of such regulation of the market milk business is that of Philadelphia. The following description of how the interests of the milk producers, the dealers, and the consumers were all recognized and protected by the amicable co-operation of the producers' association and the city milk dealers under the able leadership of Dr. Clyde L. King, "Milk Price Arbitrator for Pennsylvania", is taken from an article written by Dr. King and printed in the July issue of the Inter-State Milk Producers' Review, the official organ of the Inter-State Milk Producers' Association, Inc.

The Public Representatives

"It has been my duty to act as one of the public representatives in milk price matters in Philadelphia, first as chairman of the Governors' Tri-State Milk Commission, then, under the Food Administration as Milk Commissioner, and since the armistice as milk price arbitrator for Pennsylvania, appointed by the Governor. What part, if any, public representatives have played during this period it is for others to evaluate.

In this work the following principles among others have guided public officials during this period:

"1. Full and complete information has been insisted on as a basis for judgments. To this end the milk distributors in the city have filed and continue to file monthly financial statements. These and other records of these companies have been and are being examined by an accountant paid by the public, working at present under the supervision of and responsible to the milk arbitrator.

"2. Policies that increase the loads on and shorten the hauls for retail wagons have been encouraged. In many cities during the war period all sorts of plans were evolved to save milk distributing costs. These plans took the milk off the retail wagon and hence increased per quart the cost of delivering milk. Philadelphia milk has been delivered, bottled, at below the cash and carry plan for loose, dipped milk in New York City in most, if not all, of the months of the past two years and below any cash and carry plan for bottled or loose milk adopted anywhere.

"3. Every effort has been made to keep the market wholesome. Formulas that arrive at artificial prices to producers have not been used in this district as they have in others. But the need for advancing prices to producers has been squarely met as the best guarantee to consumers of an adequate supply of milk.

"4. No attempts have been made to "fix" prices by government agents. Price conferences have been and are attended by the representatives of the public as well as by representatives of milk producers and milk buyers. In these conferences the interests of all parties including the consumer, are considered, and all agencies, whether they be those of the public, or of producers, or of dealers, have been summoned to correct evils and to keep a wholesome price situation.

Producers' Milk Prices

The milk producer selling on the Philadelphia market has fared better than have producers in fats, meats and live stock throughout the United States. In 1913 and 1914, the normal seasonal variation in price to milk producers was above and below the current price level. In 1916, the price to producers in the season of greatest production fell as low as the price for milk in previous seasons, while the prices of all other commodities tended upward. In the years 1915, 1916, and 1917, the price of milk did not increase as rapidly as did the price level, and it was not until the early part of 1918 that the milk producer in this district received a seasonal increase above as well as below the price level of other commodities and an annual average price equal to the price of other commodities. By the year 1918 the milk producer in this district was getting a price for his product fully equal to the price increase in all other commodities. The producer in 1919 received an annual average of 3⅓% more than he received in 1918, as compared with an increase of about 15% in the general price level. In this district, therefore, while the prices to milk producers lagged in 1915, 1916, and 1917, they fairly caught up with the current price level in 1918, but lagged in 1919.

RIVERVIEW PANSY, AYRSHIRE COW OWNED BY BLACKBURN FARM, PENNSYLVANIA

Her 300-day production of 16,590 lbs. milk, 382.9 lbs. fat gives her third place among senior four-year-olds. On a second roll of honor test she has averaged 50 lbs. milk for four months.

"The farmer worked during the war period. He was not a profiteer. His output equalled or exceeded that of previous years. But the prices for his commodities did not rise so rapidly as did those in other industries. Whether the money price for the products of the American farm goes up or down, the relative price for what our farmers produce must increase in future months or consumers will wake up short of food. To put it another way, it was the middle class farmers and their salaried city cousins on whom the real brunt of the war fell. Unless we want to see further exodus from the farm to the city, the war debt to producers must be repaid in relative if not actual higher prices in the future.

"The milk producer selling on the Philadelphia market has received as high a net annual price as any milk producer in the country and he fared better than did producers of milk, meats and fats generally.

The Milk Dealer's Part

"The farmers selling on the Philadelphia milk market have helped to stabilize prices to consumers. But it cannot be said that the favorable retail price in Philadelphia has been at the expense of Philadelphia producers as compared with the prices received by milk producers in other districts, or for the year 1918, as compared with the price level of other commodities.

"During the year 1919 the consumer in Philadelphia paid an average of one and one-half cents per quart for each month below the average price paid by consumers in New York City, Pittsburgh, and Chicago for pasteurized milk delivered, while the milk dealer in Philadelphia paid as much to the farmer for his milk as did the dealers in these other cities. In other words, Philadelphia milk dealers have received, cooled, pasteurized, bottled, and deilvered milk at one and one half cents per quart below the average spread taken for these services, including profits, by the milk dealers in these other cities.

"In the period before the war, when milk was selling at eight cents per quart, about four cents per quart of the annual average went to the producer and four cents to the distributor. This was the situation in 1914. By 1919 the farmer was receiving nine cents per quart and the distributor five cents per quart for his services. The price to the producer, that is, had increased 125% while the share taken by the distributor had increased 25%. In other words, out of six cents increase in the price of milk to the consumer in Philadelphia during the war period five cents went to the farmer and one cent to the milk distributor.

"Can anyone point to any group of business men, other than Philadelphia milk dealers, who are today performing the same or better service at but 25% increase over the prices charged for those services in 1914. There may be such, but every consumer knows how scarce they are.

"By what principles and methods have the dealers in Philadelphia accomplished this result? The following are among the principles and methods responsible:

"1. The Philadelphia dealers co-operated with public representatives to keep costs low. * * *

"2. Milk in Philadelphia is sold from the retail wagon. Over 90% of the milk consumed in Philadelphia, probably 95%, is sold from the retail wagon. The larger the load on the retail wagon and the shorter the haul, the lower the delivery cost per quart. * * *

"3. Wages to milk drivers have been in large part on a commission basis. The result is that a driver is rewarded in proportion to the work done. * * *

"4. The price to the consumer has been stabilized. This has been possible with the co-operation of the producer, as explained above. The result is that wastes, due to fluctuations on retail wagons, are eliminated. The demand remains constant and hence many costs found where the price widely fluctuates as between winter and summer have been done away with. Stabilization does not mean the same price in winter as in summer. But it does mean that the winter price is kept as low as is consistent with winter production. * * *

"5. The milk plants in this city are well planned and carefully managed from the viewpoint of low costs. The costs in these plants in Philadelphia vary materially as between plants and not all are as efficient as the best, and all have possibilities for improvement. But the Philadelphia plant with the highest plant cost is still lower than the lowest plant cost in many a city.

"6. The newspapers and representatives of the consumers have co-oper-

(Continued on page 166)

Winter Proof Paint

PAINT is the armor-plate that protects the surface on which it is spread from the elements regardless of extremes in temperature.

The weather resistant qualities of paint are put to the acid test when a biting cold "nor-wester" whips sleet or snow into the paint film. That's the time that inborn stamina counts.

To do its job properly—to make it worth every penny you invest in it—paint must be *part of the surface it covers.*

It must expand or contract in summer's heat or winter's cold.

Metallic lead is soft and pliable. White lead is corroded metallic lead; it retains the metal's characteristics.

Carter White Lead has four points of superiority—intense whiteness, extreme fineness, great spreading capacity and absolute uniformity.

Paint made from Carter White Lead and pure linseed oil, colored to suit, will not crack or scale because the lead and oil form a perfect film that dries hard into the pores of the wood yet keeps its "life" through years of honest service.

It will cost more to use a cheaper paint than Carter White Lead and pure linseed oil.

Carter White Lead Co., Chicago, Ill.

"Save the surface and you save all" Paint & Varnish

How a Heifer Made Her Record

MANLEY SHARP, WISCONSIN

FRANCES Lydia was born February 20, 1917. Her dam, Lydia Snowdown, is a splendid individual having a record of 324.95 lbs. butterfat as a two-year-old. Both dam and sire transmitted their milk and butter qualities to Frances Lydia. From March 4, 11919, to March 4, 1920, this cow milked 9,589.5 lbs. of milk testing about 5.5 per cent and making 501.9 lbs. of fat, placing her 11th in class GG. Within this same year she gave birth to two excellent calves. She is owned by Dr. W. A. Munn of Wisconsin.

As an economical producer of milk and butterfat we never before saw her equal. The total amount of grain fed was small, compared to what most cows eat when forced for big records. During the time that she milked 40 to 45 lbs. per day she rarely ate over nine or ten pounds of concentrates daily, ten pounds of alfalfa or clover hay, twenty-five pounds of silage, and twelve pounds of beet pulp.

Her preparation for test was begun when she was a calf and continued until she freshened. However, we began to feed her with special care about two months before she freshened. She was fed a mixture of bran, oats, corn, and oil meal, and all the silage and alfalfa hay she would consume, up to within two weeks of calving time when we reduced her rations to light succulent feeds. She was cleaned and brushed daily, and during the cold weather she was blanketed with a medium heavy blanket.

On February 28, 1919, she dropped a fine bull calf. As soon as the calf was born, the cow was given all the warm water she cared for and a warm bran and oat meal mash. She cleaned properly, had a good appetite, and was in good condition in every way. The calf was taken away after two days. The cow was then milked just twice a day for a few days and then three times. The total milk of the first few days was about twenty-five pounds, but this was increased a little each day. Her feed was increased slowly, and within fifteen days of the birth of her calf she was milking forty pounds a day and testing 5.2%.

The first month she milked 1,240 lbs., which at that time was 482 lbs. more than her bodily weight. The second month was nearly as good, for during this month she milked 1,230 lbs. And in the third month she milked 1,226 lbs. During each of these months she milked over 450 lbs. more than her bodily weight. The test was about five per cent for these three months. The following three months she milked splendidly. The seventh, eighth, ninth, and tenth months she milked well and tested high, and the last three months she tested 7.85, 8.03, and 8% respectively. During the last three months of the test she milked rather low but tested exceptionally high. The drop in milk was due in a large measure to a change in the milker and feeder and also to the fact that she had been carrying a calf for eight months.

The results of this cow's test brought to our minds more forcibly the fact that the careful study of the cow's appetite and habits, conforming to them with respect to feeding and care, is a factor which every dairyman should follow in testing for official records. The observation of these things had a big tendency to keep her appetite sharp and thus stimulate her production. The eye of the cow, her breathing, and the manner in which she attacks her food are all factors which determine how much to feed.

We found that after she had eaten one grain mixture for a month or so she would begin to grow tired of it. As soon as this was noticed, her feed was changed—that is, the more bulky portion of the ration was substituted by something else. So long as she would eat this ration with relish, she gave her maximum, but as soon as her appetite became a little sluggish, she would drop some.

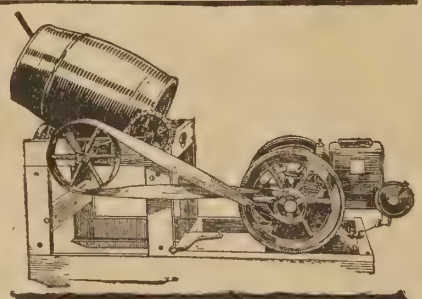
Besides paying strict attention to her feed, the other important details of dairying were observed. She was brushed daily. Her stall was cleaned twice a day and well bedded. Her drinking cup was always full of clean, fresh water. She had access to plenty of clean salt.

Other records made on the Munn Farm last year were: Brownie of Linwood: 10,762 lbs. milk, 532 lbs. fat, in Class GG; Bonny Bay's Beauty Eagles, 476 lbs. fat; Flora's Sailor Girl, 300 lbs. fat in 6 months and still milking over 30 lbs. daily. From our experience with these cows we believe that breeding is first and foremost. The blood tells but, with the best breeding and individuality, if special attention is not given to the habits of the cow with respect to feeding a feeder cannot feed intelligently. Most anyone can find tables of feed and mix a balanced ration and throw it before a cow, but this may be just the thing which will throw the cow off her feed.

Within our own state are herds of pure-bred cows on test, which are not doing their best. Not because they are not fed good feeds. No, but because the feeder does not watch carefully enough the results of his feeding.

FRANCES LYDIA, OWNED BY DR. W. A. MUNN, WISCONSIN
Record: 9,589.5 lbs. milk, 501.9 lbs. fat, Class GG. Sire, Park's Billy France. Dam, Lydia Snowdown.

NOTICE THE POINT



IT'S A NEW FEATURE
Found only in The PIERCEASY Bull Ring
No more tearing of the nostrils, because it is now so simple and easy. Just pass the ring thru the nostril, put in one small screw and the work is done quickly, making a clean hole thru the nostril.
CUTS A CLEAN HOLE
Made of a SPECIALLY PREPARED METAL and in SEVERAL SIZES
The Pierceasy Bull Ring is the latest and most durable ring on the market. More simple and efficient than the old style bull ring and many times more practical.

Dairying Thirty Years Ago

Notes From the Issue of Hoard's Dairyman for August 22, 1890

A discussion was being carried on concerning the adulteration of milk with water. Cheese Instructor O'Connel of Wisconsin had stated that he had milked many cows and tested their milk and had not found one that gave milk testing below 3½% fat. He held that the state standard of 3% fat was too low and should be raised. The following editorial statement was made on the subject of adulteration:

No patron of a cheese or butter factory need to "shiver in his shoes" when he drives up to the factory in the morning and finds a state official, with his jars, ready to take a sample of his milk, if he has taken the milk to the weigh-can just as the cows gave it. If he is honest, he ought to welcome the officer's presence and encourage him to "spot" the man, if there is such a one, who is stealing money from his neighbors by making dishonest milk.

W. A. Henry, president of the Wisconsin Dairymen's Association, under the subject "Wisconsin Advancing in Dairying" spoke of the aid the newly established Wisconsin Dairy and Food Commission would be in continuing the "advanced movement in dairy matters, which, if continued as has been mapped out, will cause her to rank still higher in the dairy industry."

"One most interesting line of investigation is that of testing milk delivered by patrons at cheese factories and creameries for the purpose of determining the percentage of fat. The surprise of the patrons as they drive up to the factory at finding a state officer waiting to open the can and take samples can well be imagined, and the face 'sicklied o'er with the pale cast of thought' of the man who 'skimmed off a little cream for his coffee' that morning is a fit subject for a sketch artist."

The Nebraska Experiment Station reported favorable results with alfalfa and the following editorial statement was made:

"We hope that many of our dairy farmers will not let another spring pass without providing themselves with the seed of this hopeful for their stock. Any Wisconsin man who has tried it is invited to give his views and experience in the Dairyman."

O. Moffet of Iowa had had so ill results in inbreeding his herd of Jerseys that he was moved to the following statements concerning this practice:

"This subject resembles that of breeding for sex in that, if there is any science in it, it is so strictly scientific that the science soars far above the ken of such common plebian mortals as this writer. This conviction is forced upon my mind from experience and to my sorrow. I am not rash enough to dispute the wisdom or policy of 'judicious inbreeding' against so great an array of wisdom and science; on the other hand, but with equal candor, I beg to say that as for me I will take no more of it in mine."

The first conviction for dealing in adulterated oleomargarine had been secured. Ohio was the first state to enact a law prohibiting manufacturers from coloring oleomargarine with artificial coloring matter.

The following were current market quotations:

Elgin, Ill., Aug. 18—Market firm. Butter. Call board sales, no sales. Floor sales 270 at 22¼c. Sellers refused all call bids, holding for 23c.

August 11, 1890, butter sold at 20, 20¼, 20½c; August 19, 1889, 18, 18¾, 19c; August 20, 1888, 20c; August 22, 1887, 25c.

New York, Aug. 16—Butter. There has been a marked improvement in the general tone of the market this week. At the close fancy pails are firm at 21c. Only a few marks of Elgin have arrived this week, and they went to regular trade at about 20½@21c. Exporters have made a few purchases of pretty good stock at 13@14c. Arrivals of state dairy continue very light and there is ready sale for anything that shows merit. Best half tubs bring 17c. Imitation creamery rarely shows fine quality; an occasional lot is placed at 13@14c.

Cheese—This has been a very broken week. The strike on the New York Central prevented shipping by that route. For the last day or two there has been a fairish trade on the basis of 7¾@8c for fancy state colored and 7½@7¾c for perfect white. Oswegoes, etc., was at 7⅞c for fancy colored and 7⅝c for fancy white. Some of the fanciest parcels of large size cheese have been taken at 8@8¼c. Most of the choice Chenango Co. night skims went at 5@5¼c. Nothing doing in Ohio flats. Liverpool cable colored 40s. 6d, white 39s. 6d.

Do Your Washing Where Cool Breezes Blow

THE Maytag Multi-Motor is one of the greatest achievements among power washers.

It is a power machine — with its own power plant. Works *anywhere*. Under the trees—where the cool breezes blow. On the shady porch. In the shed or the cellar or the kitchen.

Any woman can operate it in absolute safety. Handles heaviest washings in a short time. Will not harm dainty things. Cleanses thoroughly. Costs little to operate.

Comes equipped with an adjustable, reversible, 3-way *power wringer*. Merely feed the clothes through it. Wring from washer to rinse — from rinse to blue—from blue to basket without moving the machine.

Go see the local Maytag dealer. If you do not know him, write at once for his name and a free copy of our famous Household Manual. Act today.

The Maytag Company, Dept. 105, Newton, Ia.

Branches at Philadelphia, Pa.; Indianapolis, Ind.; Minneapolis, Minn.; Kansas City, Mo.; Atlanta, Ga.; Portland, Ore.; Winnipeg, Man., Can., and The Maytag Company of England, 323 Caledonian Road, King's Cross, London.

Does Mrs. Housewife Demand Your Butter?

She is the judge of butter value. *She knows* sweet, clean butter must be protected from dirt, dust and bad odors.

And *she is only too glad* to pay extra for good butter wrapped or covered with

Paterson Pioneer Parchment Paper

It is *worth* more. Your brand stamped on it stands for *quality*. She learns to demand it by name. *You profit.*

Made in rolls, sheets and circles, to suit all methods of marketing.

Write for free samples and book "Better Butter". It points the way to better butter prices and bigger business.

Producers' and Consumers' Interest in Milk Prices

(Continued from page 163)

ated in Philadelphia to maintain and increase milk consumptions just because the price situation has been pre-eminently fair. Philadelphia is consuming as much milk at 14 cents as at 8 cents per quart. Milk at 14 cents per quart, under prevailing wages, is much cheaper than it was at 8 cents.

"A survey made by representatives of charitable organizations for the Food Administration revealed that the milk consumption in the congested districts had not decreased with the increase in price save in those few groups where wages had not increased. * * *

"7. There is less duplication in plants and of retail wagons on the streets in Philadelphia than in most cities. The savings in large scale plant and distributing facilities account in large part for the fact that the spread to the dealer in Philadelphia has not increased in proportion to other costs. As compared with other cities, the retail loads are larger and routes shorter. * * *

The Consumer's Part

"And, finally, may I add that the milk price situation in Philadelphia would not be as it is had it not been for the co-operation of the newspapers in Philadelphia and the representatives of women's clubs. Both have joined heartily throughout in acting after knowledge and fairly in the interests of all. The representatives of women's clubs and of charity organizations, and those in charge in the schools, all have done well their share in making and keeping the present price situation what it is. Prices are not the result solely of inexorable laws over which people have no control. Prices, especially for such a commodity as milk, are affected by public sentiment and good will and the ethical standards and public conscience of those who buy and sell. All these factors have played their part in keeping the milk price situation in the Philadelphia district all that it is."

New York Dairy News

Six Ton Cheese for State Fair:—The big cheese, which is annually one of the most interesting exhibits at the state fair, was made Aug. 1 at West Martinsburg, Lewis County, by H. A. Reese of Lowville, who is famous as a maker of monster cheeses for the last three world's fairs. Lieutenant-Governor Harry C. Walker and Commissioner of Agriculture Hogue were present to watch the process, during which the entire curd output of several factories was used.

The monster cheese will weigh about 12,000 pounds. Last year's cheese weighed 6,185 pounds and measured about 4½ feet high by 8 feet in diameter. Thus, the cheese this year will be twice as big, measuring about 6 feet in height and 10 feet in diameter. It will be cut on the opening day of the fair and sold in pound pieces to visitors.

On account of its size it will not go in a freight car, therefore it is to be carried by motor truck to the Dairy Building.

Higher Milk Prices:—Milk dealers in Syracuse have announced that the price of milk will be advanced 1 cent a quart for the month of August. The price will also be raised the same amount in New York City, making it 20 cents a quart.

During the last week in June similar announcements were made in both cities. In New York City the price was raised 1 cent a quart on July 1st, but in Syracuse the blow did not fall. The fact is established that Syracuse is getting better and more economical milk service than New York City.

New York City has greater problems of distribution than Syracuse. Still, dealers there mainly based their reasons for the advance upon the increased cost of milk to them.

Farmers do not hesitate to say that they expect four-dollar milk this winter. If that is so, and they justify it by the use of the Warren cost of production formula, it is plain that the price of milk will have to rise.

"Milk Bar" at Cortland County Fair:—For two years the state of New York in co-operation with New York City has held a milk exposition in that city which has proven to be a great success, especially at the milk bar, in drawing the attention of the public to the serving of milk in attractive and delicious drinks. This year, counties are featuring "Milk Bars" at fairs and farm and home bureau picnics, and Cortland County is among those who will have such a "Bar" at their fair which will be held August 16th to 21st.

Iced Cocoa, Guernsey Highball, Holstein Fizz, Buttermilk, and Sweet Milk are among the drinks which will be served.

The nutrition authorities at the School of Home Economics at the State College of Agriculture assert that the milk pitcher, when supplemented by the vegetable garden, is the best friend of the woman who wishes to set a wholesome and economical table and assure the safe nutrition of her family. Milk comes nearest of all foods to being a complete food in itself.

New York. E. M. L. BLANCHER.

Louisiana Silage Suggestions

Harvesting the crop at the proper stage of ripeness and putting it into the silo under the most favorable conditions are the most important factors in making the best quality of silage. Moldy silage is perhaps a source of the greatest loss that occurs from crops made into silage and every effort should be made to prevent the formation of same. Molds in silage cause not only a loss in feed but are dangerous when fed to live-stock and especially to horses and mules.

The following precautions and methods when observed in filling the silo will prevent in a large measure the formation of molds, dry rot, etc., and insure a good quality of silage.

Cut corn for silo when the fodder is ready to pull. The grain has passed the dough stage and has become glazed. Up to this time the plant increases in food value and is not ripe. Sorghum should be made into silage when ripe and the seed is in the dough stage, which is usually when the crop is ready for making syrup. All crops for silage should be cut not more than one-half inch in length, should be evenly distributed over the silo, packed well, and all air excluded. The exclusion of air from all portions of the silo is the one means that will prevent the formation of molds.

Over-ripe crops and weeds and hollow-stemmed plants prevent proper packing, cause insufficient moisture for proper fermentation to exclude all air, and furnish favorable conditions for the development of molds.

MAJESTY'S MINERVA,
New junior 3-year-old Jersey champion of Vermont with a record of 11,476 lbs. milk, 683 lbs. fat. As a two-year-old she produced 7,567 lbs. milk, 431 lbs. fat.
OWNED BY QUECHEE FELLS FARM, VERMONT

Where the crop used for making silage does not supply sufficient moisture by its juices to moisten every particle of the silage, then sufficient water should be added to furnish this moisture. This is best done by spraying the cut material as it passes through the blower of the cutter, where every particle may be moistened sufficiently. This method never gives too much water.

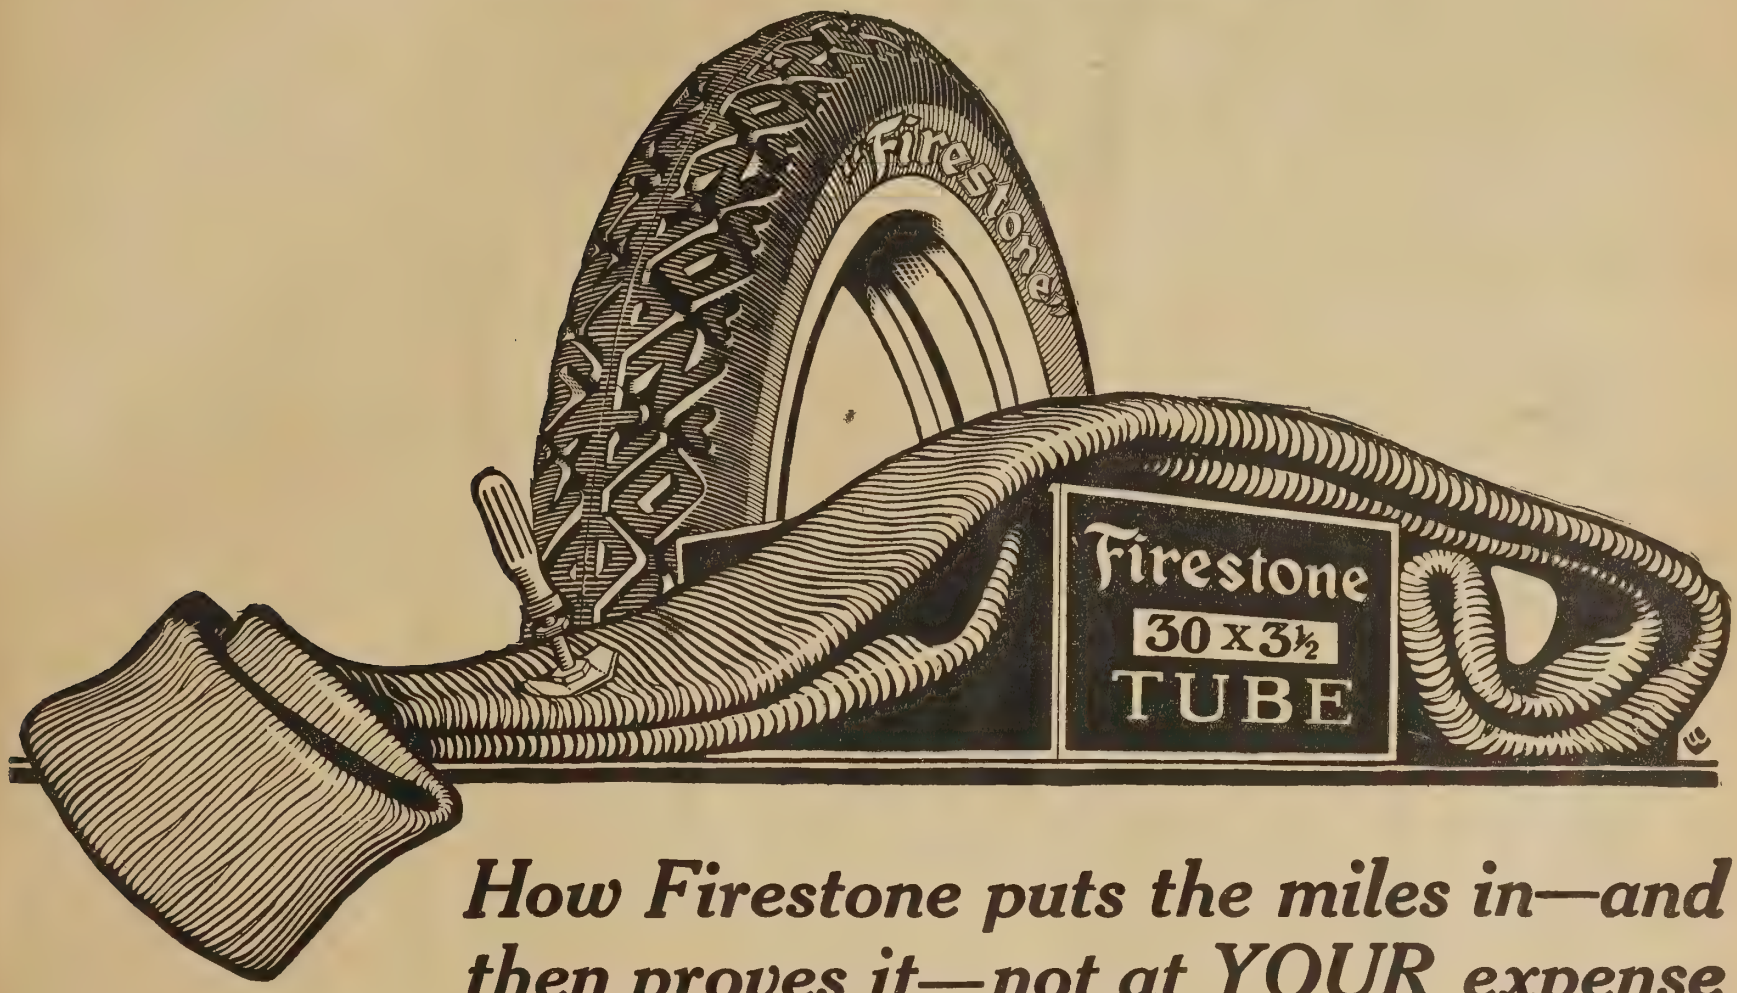
Crops when cut too green for the silo make silage that is sour and contains an excessive amount of acid. The silage is not palatable, does not contain its maximum food value, and a loss is sustained.

Silage made from a good corn crop this year will be worth from $10 to $15 per ton, which is sufficient reason for using every precaution and applying the best methods in the making of same. Although corn will sell at a high price this fall as usual, we hope that it will not prevent any dairy farmers from filling their silos. It should be remembered that when the corn crop goes into the silo not only the grain is prepared in the best way for feeding dairy cattle, but the stalk and fodder are also saved, and the entire crop is used for feeding the dairy herd.

Louisiana. C. H. STAPLES.

July Condensery Prices

Prices paid producers for 3.5% milk delivered at factories during July are based on reports made to the U. S. Bureau of Markets by condensed and evaporated milk firms operating approximately 80% of the total factories in the United States.



Geograhpic sections	No. firms reporting	Price per cwt. Range	Ave.
New England	4	$3.05—$3.76	$3.53
Middle Atlantic	95	2.60— 3.46	3.08
South Atlantic	7	2.60— 3.44	3.08
East North Central	119	2.50— 3.42	2.98
West North Central	15	2.45— 3.20	2.73
North Western	21	2.50— 3.25	2.69
South Western	15	2.60— 3.20	2.87
United States	276	2.45— 3.76	2.98

The wholesale prices given below are averages based on reports made by manufacturers covering actual sales of condensed and evaporated milk delivered to jobbers, wholesale grocers, and similar buyers at manufacturers distributing points on basis of cash short time credit. Foreign prices are given as f. o. b. or f. a. s. points of export in section in which sales were made.

A big-scale road test on 3,200 tubes

How Firestone puts the miles in—and then proves it—not at YOUR expense

No other tubes in the world are road tested on so big a scale as Firestones. The Yellow Cab Company of Chicago uses Firestone Tubes exclusively on its 800 taxicabs. The service of these tubes is checked constantly—improvements and developments are arrived at.

By close watching of a large number of tubes in service—not confined to isolated instances—the conclusions are accurate and definite.

Firestone puts the best in materials into tubes by establishing purchasing experts at Singapore, center of the world's rubber market. Firestone puts the best in workmanship into tubes by organizing the crack manufacturing organization of the industry on a profit-sharing basis.

And then subjects the finished product to this big-scale road test—in order to get you more for your tube money and most miles out of your tires.

Firestone Tubes resist heat—which everyone knows is the tubes' worst enemy. Their laminated construction, ply on ply of thin rubber sheets laid crosswise and perfectly vulcanized, gives the stoutest tube wall. Their larger sectional size means less stretch to fill the casing. Ask your dealer for Firestone Tubes. They cost no more than the ordinary kind.

30x3½ Red, $4.50; Gray, $3.75
Other sizes in proportion

Firestone

Roofings of Known Quality —

THE long established and widely known quality of Barrett Everlastic Roofings eliminates risk and uncertainty from roofing purchases.

These roofings are made by the company that has been the leading manufacturer of roofing materials for over fifty years. They are giving perfect satisfaction on thousands of farm buildings, country and city homes and factories all over America

You can use them on any and every steep-roofed building about the place. They are made in four styles—two forms of Shingles and two of Roll Roofings.

Both styles of Everlastic Shingles are surfaced with real crushed slate in beautiful, rich art-tones of red or green. You can't buy more artistic roofs at any price. They are low in price, easy to lay, highly fire resistant and wonderfully durable.

One style of roll roofing is also slate surfaced in red or green. The other—Everlastic "Rubber" Roofing—is plain surfaced and gives unfailing satisfaction wherever this type of roofing is needed.

Look for the Everlastic name when you buy. It's your protection against inferior roofings.

Everlastic "Rubber" Roofing

A recognized standard among "rubber" roofings. Famous for its durability. Made of high-grade waterproofing materials, it defies wind and weather and insures dry, comfortable buildings under all weather conditions. Nails and cement included.

Everlastic Slate-Surfaced Roofing

A high-grade roll roofing, *surfaced with genuine crushed slate,* in two natural shades, red or green. Needs no painting. Handsome enough for a home, economical enough for a barn or garage. Combines real protection against fire with beauty. Nails and cement with each roll.

Everlastic Multi-Shingles
(4-Shingles-in-One)

Made of high-grade thoroughly waterproofed felt and *surfaced with crushed slate* in beautiful natural slate colors, either red or green. Laid in strips of *four shingles in one* at far less cost in labor and time than for wooden shingles. Give you a roof of artistic beauty worthy of the finest buildings, and one that resists fire and weather. Need no painting.

Everlastic Single Shingles

Made of the same durable slate-surfaced (red or green) material as the Multi-Shingles, but cut into individual shingles, 8 x 12¾ inches. Laid like wooden shingles but cost less per year of service. Need no painting.

Uncle Sam's Hired Men Who Serve You

(Continued from page 151)

rope and sent back parasites and natural enemies of both the gypsy and brown-tail moths. These insects are no longer serious enemies of orchard, shade, or ornamental trees. Imported enemies and other control measures have got them in hand. Even in mixed forests, a system of forest management has been devised which, with the help of the natural enemies, results in practical control wherever adopted.

A few years ago the Japanese beetle got into New Jersey on imported nursery stock and threatened tremendous damage. The Department of Agriculture, in co-operation with the state authorities, have held it to a comparatively small area, and a representative of the Bureau of Entomology is now in Japan finding out the natural enemies of the beetle and sending them to prey upon it in New Jersey.

The sugar cane moth-borer, for several years past, has been causing heavy loss to sugar planters in Louisiana, having got across the water from Cuba. The Department of Agriculture kept a specialist in Cuba last season finding out the natural enemies of the borer and sending them to Louisiana. A number of them have been established. This year men will be kept in Cuba and many more borer enemies will be introduced to help in the control of this very dangerous enemy of the sugar crop.

Another of Dr. Howard's specialties is medical entomology—he is an M. D. in addition to the scientific degrees he holds from Cornell and other institutions. He has been especially interested, therefore, in the insects that cause disease in man. The detection of mosquitoes as carriers of yellow fever and malaria made the control studies and biological studies of mosquitoes which he early made in the Department of Agriculture of the greatest help in the control of disease. So he has worked against the house fly as a carrier of typhoid fever and other diseases. His books, "Mosquitoes" and "The House Fly—Disease Carrier", were published when the compaigns against those insects were in the critical formative period, and each book has been a power against the enemy of man with which it deals.

These are just a few of the things that the Bureau of Entomology, under Dr. Howard's direction, has done. There are a great many others, some of them of even greater economic importance. Just now, the entomologists of the department are fighting the pink bollworm of cotton, the most destructive enemy of that crop, which has got into Texas and Louisiana from Mexico. But for this work, it would spread over the South, levying a heavy loss on every crop and undoubtedly destroying the cotton industry in many places. When the cotton boll weevil came in 28 years ago, Dr. Howard recommended the passage of a strict quarantine law and a campaign of extermination while it was still confined to a narrow area. State co-operation could not be secured, however, and the boll weevil has destroyed millions of dollars of cotton every year since, estimated as high as $200,000,000 in a single year. During the past few years, however, the Bureau of Entomology has discovered a means of control by dusting the cotton with calcium arsenate. The effectiveness of it is indicated by the results of one experiment in an abandoned field where a poisoned strip produced 480 lbs. of cotton against 50 and 60 lbs., respectively, for two unpoisoned strips of similar area. This system has been adopted by many planters and is already saving tremendous quantities of cotton.

The Hessian fly has long been the most destructive enemy of small grain—seriously competed with only by the chinch bug. Cultural methods of control have been developed which, where followed, reduce injury from both these pests by millions of dollars a year.

A slight modification in cultural practice was found by which the clover seed midge is controlled and the clover seed crop over a large part of the country saved.

Coniferous forests are protected against the destructive bark beetles by a system of removing a certain per cent of infested timber at certain periods, and the cost is met by the value of the timber cut.

But the story can not be told in full. Nearly half a century of work can not be shaken down into a sketch. During that time, Dr. Howard has written and published more than 800 books and papers, many of which have been translated into various languages. He is a member of more than 20 scientific societies in this and foreign countries. He is a member of the National Academy of Sciences, is president of the American Association for the Advancement of Science, and has held offices in various other scientific bodies in this country.

And all those things have not taken up all of his time. He used to be interested in all out-of-door sports, and in later years has devoted some attention to golf. But his principal recreation is people. He is always interested in the other person's viewpoint whether the other person be man, woman, or child. He talks with everybody everywhere, and learns something from all of them, he says.

Reverting to the initial estimate placed on Dr. Howard's services, I do not want to create the impression that even at half a billion dollars a year, he is the most valuable man in the Department of Agriculture. As I said before, he is a modest man, and such a statement would not please him. Anyhow, there are 16 other bureau chiefs, any one of whom has a value comparable to his.

Scotch Ayrshire Judge at the National

The Ayrshire Breeders' Association announces the selection of the Honorable Hugh W. B. Crawford of Chapmanton, Castle Douglas, Scotland, as judge of Ayrshires at this year's National Dairy Show, and Mr. Crawford has cabled his acceptance of the duties.

Mr. Crawford is not only a breeder but is in educational work as well. He has been an active participant in all dairy development work in Scotland for a great number of years. He is possibly the best known breeder of Ayrshires in Scotland at the present time, and is most highly respected by his fellow breeders.

The selection of Mr. Crawford to judge at the National is of portentious moment to the breed, and every Ayrshire breeder in America should be at the ringside to see where the Scotchman's opinion of American breeding differs from theirs, and have a good-natured ring-side explanation on all judgments rendered.

The Ayrshire runs true to form, so that the Scotchman's work will be intensely interesting to breeders on both sides of the ocean.

Mr. Crawford will visit many parts of our country while here as the guest of the Ayrshire Association, and his visit should be the cause of a great Ayrshire rally for extension work for this splendid breed of dairy cattle.—N. D. S. Publicity Dept.

Women to be Dairy Products Specialists

Is milk a food or a beverage? Is it any more reasonable to make the amount of butterfat it contains the standard of value of milk than it would be to assume that the price of meat should be governed by the fat it contains? Stockmen have long recognized the value of skimmilk as a food for animals. Since animals have

CONIE FOOTE

digestive systems which are constructed so as to use foods which humans cannot use, why should human food be fed to animals?

These and other questions suggest the field of usefulness of the dairy products specialist. Two states have regularly employed women specialists in this department, Kansas and Iowa.

A $500 scholarship has recently been established at the Kansas Agricultural College at Manhattan by P. M. Sharples of the Sharples Separator Company to prepare young women for work in this field.

Miss Conie Foote of Downs, Kansas, a junior in home economics, was awarded the honor for 1920. After her graduation Miss Foote will spend at least one year in educational work along dairy lines.

Wisconsin Dairy Council Report

The James Manufacturing Company of Wisconsin sent a check for $500 to the Wisconsin Dairy Council in July, which is their share towards a dairy advertising campaign. Mr. James also sent a letter stating that he was willing to do more if it was necessary. Now, Mr. Farmer and Mr. Creameryman, it is about time for you to wake up; you are the ones to receive the direct benefits from the work of the Wisconsin Dairy Council. We only secured money from twenty-three members during the month of July; however, we had a good many promises, but remember that the Council cannot live on promises, they must have your moral and financial support.

The members of the Wisconsin Dairy Council will be asked to exhibit their products at the State Fair in the Dairy Council booth. Arrangements have been made to display butter cartons and wrappers from the creameries who are members. The cheese factories will be asked to send a sample of their cheese. The ice cream manufacturers will be asked to send some of their advertising matter. The condenseries will be allowed to display their products. The milk distributors will be asked to send one of their market bottles and the farmers who are members will be rewarded for their support by having their names at the head of our membership. All other concerns who are members will be allowed to display some of their advertising or material handled. It is up to every man interested in the dairy business to see that his product gets proper recognition, therefore, see that you do your share towards the Wisconsin Dairy Council:

Save Many Ways

Save first on first-cost. The New Mitchell should be compared to cars costing $500 to $1000 more. Nowhere will you find such a fine car, combining new-day style with dependable performance, at such a low figure.

Save in the future. The New Mitchell affords a car of lasting newness, one that is stronger, more durable, and better built. It brings new accuracies in manufacture, finer materials, and sturdier assemblage.

It is built complete, including the bodies, at the highly efficient Mitchell plant.

The New Mitchell brings not only these savings, but a future-style car, one with new lines and refinements. It brings a roomier, more comfortable body. And a careful attention to details of finish found only on costlier cars.

We suggest, as a precaution, that you see the New Mitchell before you buy. Examine it. Then make comparisons.

A Mitchell dealer will be glad to assist you by showing the New Mitchell's superiority and giving you the points by which to judge.

Several Hundred Ohio Farms *For Sale*

WE are offering several hundred of the best farms in Ohio at prices that are low in comparison to the value of the property and the income assured purchasers.

These farms are a part of the Miami Conservancy District, which is a political subdivision of the State of Ohio, and represent a surplus acreage that we own in the Miami Valley.

Rich silt loam top-soil deposits make this land very productive—practically inexhaustible.

It is our earnest desire to bring more good farmers to this community, which lies within a thirty mile radius of Dayton. Quick markets are available by rail, interurban and highway.

We Would Like to Send You Booklets Giving Detailed Information. Just Address "Farm Division"

Tires for the Farm Truck

HOARD'S DAIRYMAN:—The matter of having the farm truck properly equipped and tired is causing considerable inquiry among farmers at the present time. The difference in prices between the solid tire and the pneumatic amounts in some cases from $15 to $25 a tire and the longevity of the two is also affected by different farm conditions, such as the kind of roads, amount the truck is used, and the load hauled.

In our section the pneumatic tires are gaining more popularity, particularly because the farm truck is being used for a good deal of long distance hauling. It is not uncommon for farmers to haul live hogs 30 miles to market, although in a few cases a 5-mile run may be all the truck will have within a week or so. Because of the larger circumference of the pneumatic tire it gives a little more speed to the ordinary truck, which is geared down considerably compared with the touring car. Where the touring car type of truck is used, however, the pneumatic cord tires are used almost entirely. In some instances where dairy farmers have heavy loads of milk to deliver short distances over bad roads, the solid tire is still retained, as this gives excellent service when speed and distance is not required.

The pneumatic tire, however, is regarded as giving best service when the effect upon the truck is considered, as the resiliency of the pneumatics is quickly noticeable over the solid tires. Where a heavy load of 2 to 4 tons is transported for long distance, however, the solid tire is almost entirely adhered to.

For the average farm conditions, however, it seems that the pneumatics are being favored more than solid tires and in some cases the pneumatics are used on the front wheels and the solid tires behind but this is generally where the truck is used for a variety of conditions and must be run over all kinds of road surfaces.

A MILK TRUCK USING PNEUMATICS ON FRONT WHEELS AND SOLID TIRES FOR THE REAR TRUCK

Keep Out the Rye

HOARD'S DAIRYMAN:—In some neighborhoods the man who grows rye and has it threshed when he takes his turn at the machine is a community pest. He spreads rye in every field that is planted from seed threshed in the same machine for several days thereafter. Such a mixed field tends rapidly to contain a higher per cent of rye and in a year or two new seed wheat must be bought.

Riding from Mulvane to Ashland, Kansas, this year just preceding harvest we counted the fields of wheat that touched the track on one side. Of 43 fields in succession 20 had a sprinkling of rye. One neighborhood apparently had cleaned up last year and 15 fields in succession were without a trace of rye.

Threshermen realize the absolute impossibility of cleaning every grain of rye out of the separator. One old separator man of 35 years experience remarked, "I always give them their own dose of rye. They have no business growing the stuff to maturity and then expecting us to run it through our machines to contaminate their neighbors' fields. So I always tell 'em, "we got to get that rye straw through here first and then their own wheat has a chance to take up the rye that is left in the machine."

The same trouble is experienced on the edge of the hard and soft wheat belts where some one persists in growing a smooth, soft wheat in a neighborhood that is otherwise all hard wheat. A Kanred field of 80 acres was found on inspection this year to be unfit for sale as pure seed because of a scattering of smooth headed wheat all over the field. The owner had used every precaution possible to keep it pure and the same field last year on inspection was found to be pure. A neighbor two miles down the road had threshed smooth wheat just before the machine came to the Kanred field and there was no way to clean it all out. It takes but a couple of handfuls of grain to contaminate a whole crop. The loss to this man this year is at least 50c per bushel on 2,000 bushels, all due to having a thoughtless neighbor. R KENNEY.

Kansas College of Agriculture.

July Milk Prices

The following table from the U. S. Bureau of Markets July report presents a comparison of the net prices received by producers for fresh milk (test, 3.5%) f. o. b. local shipping points or milk plants operated by fluid milk dealers:

Sections	Range of July prices per cwt.	Comparison of average prices 1920 June	1920 July	1919 July
United States	$2.10—$6.16	$3.21	$3.33	$3.08
New England	2.75— 4.85	3.69	3.96	3.19
Middle Atlantic	2.78— 4.04	3.11	3.21	3.09
E. North Central	2.28— 3.72	3.00	3.16	2.94
W. North Central	2.10— 3.82	3.00	3.13	2.94
South Atlantic	3.25— 6.16	4.34	4.35	3.59
E. South Central	2.66— 3.52	2.91	2.90	3.15
W. South Central	2.91— 5.50	3.84	3.84	3.91
Mountain	2.45— 3.47	3.04	3.00	2.74
Pacific	2.86— 4.41	3.42	3.59	3.10

The following table shows, for certain representative city markets, the prices of standard grade milk (Grade B, test 3.5%) received by producers and paid by consumers during the month of June:

	Producer receives per cwt.	Consumer pays per qt.	Butterfat allowance per lb.*
Birmingham, Ala.	$3.15—3.50	$.20	$ .95
San Francisco, Cal.	4.07	.16	.29
San Diego, Cal.	4.45		
Denver, Colo.	2.90	.13	.80
New Haven, Conn.	4.75	.17	.40
Washington, D. C.	4.13	.16	.40
Jacksonville, Fla.	5.81	.25	.50
Atlanta, Ga.	5.23—5.82	.25	flat

Milwaukee, Wis.	3.60	.13	flat
Beloit, Wis.	3.22	.13	.40

*In actual practice this allowance is made on the basis of a certain price per hundred of milk of a certain test, one-tenth of the price per pound fat being paid or deducted for each one-tenth per cent above or below the stipulated basic test. Where the word "flat" appears in this column, it means that no allowances are made for butterfat content but the milk must not be lower in test than legal requirement and must not be adulterated or skimmed.

The prices quoted for producers are for milk testing 3.5 per cent and delivered f. o. b. city, from which must be deducted the various transportation costs in order to get the actual price. In certain cities the prices given apply only to that portion which is considered as the producers' average production, the surplus being either handled by the producers' association or the dealers at somewhat lower prices.

The prices given are here reduced to the comparable basis of 3.5% fat, as different cities vary from 3% to 4% as the basic fat test. To reduce the prices per hundredweight to either a gallon or a quart basis divide by 11.63 or 46.33, respectively.

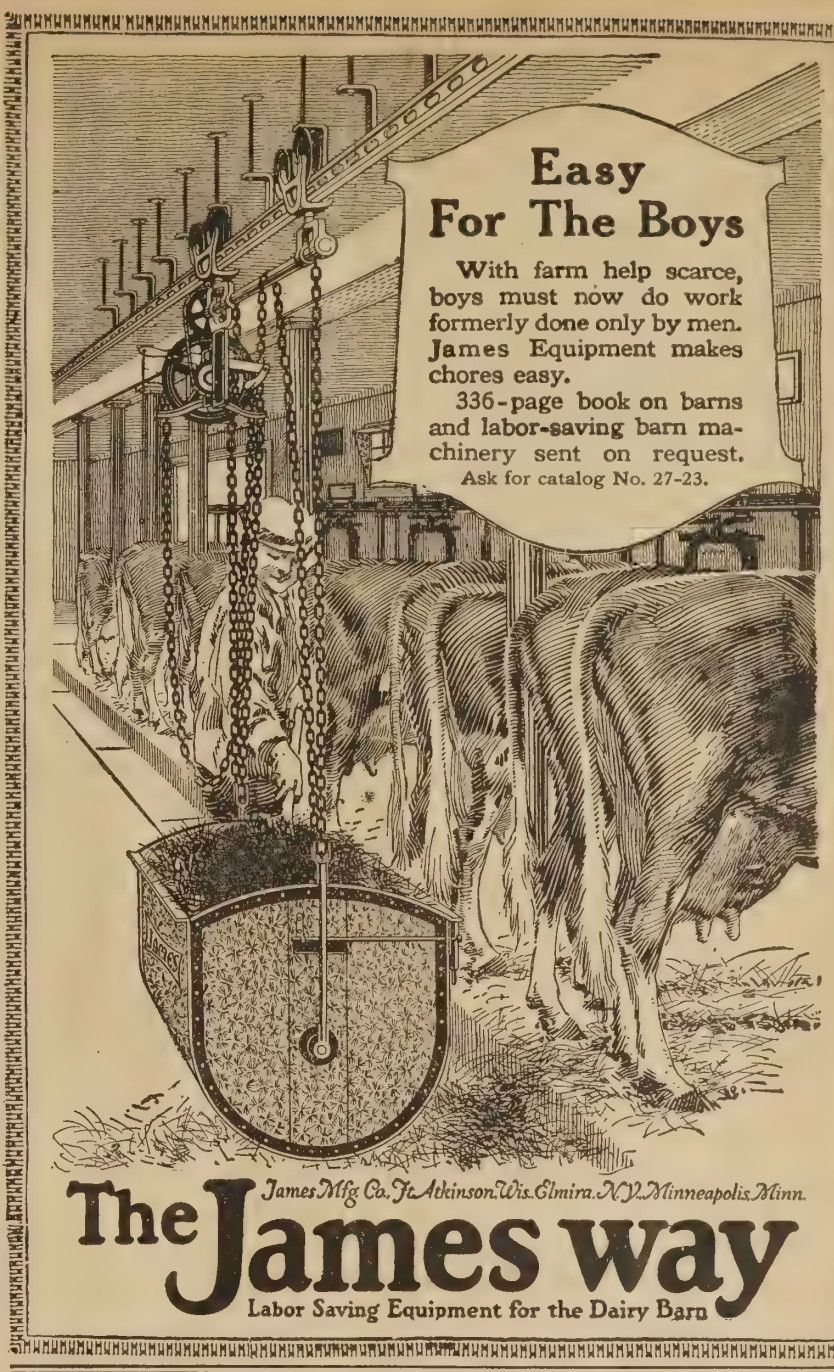
The prices paid by consumers are for average testing milk delivered in quart bottles. It is the grade of milk most generally sold in these cities and in most cases is for pasteurized milk.

Country Shipping Stations

Prices per cwt. paid at the dealers' country receiving stations or at producers' railway shipping plants are given as follows for July:

New Haven	$3.34	Butte	$3.15
Washington	3.49	Lincoln	2.65
Chicago	3.20	New York	3.15
Baltimore	3.25	Albany	3.23
Boston	3.72	Cleveland	3.25
Detroit	3.40	Cincinnati	2.75
Kansas City	2.42	Pittsburgh	3.15
St. Louis	3.25	Philadelphia	3.41

Retail Prices



The following table gives, for a few cities, the retail prices of milk, cream, and buttermilk for July, 1920:

Cities	Common milk per quart	Special milk per quart	Certified milk per quart	Light cream (18-20 per cent B. F.) per half pint	Cultured buttermilk per quart
	Cents	Cents	Cents	Cents	Cents
Boston	17	20	26	16	11.5-12
New York	16	19	26	21	12

Washington	14-16	16	30	17-18	20
Jacksonville	25	30			
New Orleans	17	19		16	15
Memphis	18		25	18	
Portland	13		21	17-18	14
San Francisco	15-16		23	15	16
Average	15.87	20.00	25.25	17.40	14.88

Bell Offers Trophy

John A. Rell, Jr., owner of Bell Farms in Pennsylvania, offers a $1,000 trophy at the National Dairy Show this year for the best three generations of Holstein females. Himself a breeder of Holsteins, Mr. Bell desires to encourage other breeders and, therefore, in offering this trophy specifies that two of the three generations must be bred by the exhibitor. The basis of award will be 60 per cent on type and 40 per cent on production. It must be won three years in succession by a breeder before it becomes his permanent property.

The trophy is a solid bronz likeness of the Bell Farm sire, Echo King Sylvia, 21 inches long and 14 inches high. The honor of possessing it for a year makes it well worth keen competition.

Save That Concrete Bill —Do the Job Yourself

EVERY good farmer recognizes the economy of concrete improvements on the farm—feeding floors, barn floors, foundations, tanks, troughs, walks, fence posts. Most of this work you can just as well do yourself. But mixing concrete by hand is a back breaker—and hiring expensive labor from town costs lots of money. Get one of these handy little mixers, especially adapted for the farmer to use himself—and you can build in your own spare time those many improvements you've wanted to put in—permanent improvements that add to the value of your farm.

THE "ELMCO" Concrete Mixer mixes two and a half to three cubic feet per batch. A one and a half H. P. engine operates it. It fills from one side and dumps from the other—anyone who has ever worked around a mixer knows what an important feature this is. Has four mixing paddles, turns 30 r. p. m., which means 120 mixings per minute. Built on solid steel frame, with either steel or cypress barrels—also with truck and engine for users who prefer this equipment.

YOU will soon have to decide if you are going to buy a mixer for fall work. You'll not be satisfied with your mixer if you buy before you first look into the merits and prices of the little "ELMCO". Let us send you our catalog of the entire line. We can make immediate shipment—a guarantee with each mixer. Mail back the coupon today for the book. It shows the line and gives some valuable tips on concrete mixing.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Cropping Facts for Junior Farmers

Junior farmers should know just as much about the crops which they raise to feed their stock and should take as much interest in this side of farm life as they do in many of the other things which seem to them to be more attractive perhaps, but it is just as important for a good farmer to know the best varieties of crops to raise as it is for him to know all about the breeds of cattle and hogs and the best bred families within each breed, but we dare say that less is known about crop varieties than about breeds of stock among our juniors.

Many of you juniors have been helping with the harvest during the past three and four weeks and we are wondering whether or not you know what varieties Dad is growing and from where they came. Believing that so little is known, we are going to try to help you out by telling you some of the interesting things about corn and grains.

Wheat

Among winter wheat growers a variety called Turkey Red is considered to be among the best. This wheat is not only hardy, that is, it does not winterkill very easily but it is a very good yielder and produces a wheat of excellent quality. Flour made from Turkey Red wheat is considered to be of the very best. Turkey Red is a pedigreed wheat having rather short heads and a smooth chaff. Most of the experiment stations located in winter wheat sections have purified this variety so that now it is possible for farmers to have the very best kind of Turkey Red winter wheat. There are many other varieties of hard winter wheat but none have proved to be better than the Turkey Red which seems to have superior qualities for a wheat variety.

MARQUIS, BEST HARD SPRING WHEAT

Marquis

The word "Marquis" is just about a pet name in the home of every spring wheat grower. This probably is the best spring wheat variety that is known at the present time. It is a beardless wheat, smooth chaff, and produces a grain that is short and stubby, having a rich brown amber color.

You may well ask, —"Why is Marquis so superior to such varieties as Fife, Blue Stem, and Velvet Chaff spring wheat?" This is the answer. Marquis spring wheat matures at least a week earlier than these last mentioned varieties and therefore it is very liable to escape bad rust epidemics and dry hot weather, both of which conditions are bad for spring wheat. There is no prettier wheat in threshed sample than Marquis. The Canadian people originated this variety. They crossed a wheat known as Hard Calcutta which was quite early in maturity with Red Fife, a spring wheat which had always been known for the quality of flour it produced. Marquis combines good qualities from each of its parents. It has some of the earliness of Hard Calcutta and a good flour making quality of Fife, therefore it is considered much superior to either of its parents. This wheat has been a great contribution to the wheat growers of the country and we are all indebted to the Canadian plant breeders for giving us this wonderful variety.

Of course, all spring wheat growers are not growing Marquis Spring wheat. Many are still continuing with the varieties which were in existence long before Marquis was thought of. These are Fife, Blue Stem, and Velvet Chaff. There is an interesting bit of history connected with the development of Fife wheat.

David Fife was a Canadian farmer. A friend of his in Europe sent him a small sample of wheat which he had taken from a cargo of wheat in the harbor of Danzig. When Mr. Fife received his wheat he did not know whether it was spring or winter wheat and it being in the spring of the year when he received it he sowed it. However, he was quite disappointed for it proved to be a winter variety and with the exception of one or two plants the crop did not mature. But David Fife was an optimist. He carefully harvested the heads of grain from the plants that did mature and seeded these the following spring. The result was a hard spring wheat which he continued to grow and which has ever since been known as Fife.

The greatest criticism that Fife wheat has had is that it is rather late and hence is liable to be struck by drouth and rust. Now that we have Marquis spring wheat, Fife is not being grown so much. Neither is Blue Stem which is a downy chaff wheat and which is just about as late as Fife in maturity.

Perhaps you already know that Velvet Chaff spring wheat hasn't been very well named for it is not Velvet Chaff as the name would suggest. Its chaff is smooth and it has beards. It goes under several other names as well. It is sometimes called Preston and in other localities it is called Blue Ribbon, but it is all one and the same wheat and looks something like Turkey Red winter wheat excepting that the heads are longer.

The Canadians are still doing some wonderful work in wheat breeding. What they desire to get are early varieties which will escape rust and dry weather and even the frost because wheat is often frost bitten right in the fields because their growing seasons are so short. Among some of the very early varieties which they have produced are Prelude, Ruby, and Red Bobs. While these are all very early, they are not very good yielders because it is very difficult to combine earliness with high production among plants. Nevertheless the Canadian breeders are not discouraged and in time they may accomplish something which will be better than the Marquis spring wheat which we now hold so valuable.

Rye

Rye is not such an extensively grown crop as wheat but still the rye plant is very interesting. There are two kinds of rye, winter rye, and spring rye. The former is far more preferable because it is so much better in yield. Rye is a grain crop for the sandy soil farmers. It produces well where other grains fail and for that reason it has been called the "poor man's" crop or the "poverty" grain. There are only a few varieties of winter rye which seem to excel. They are Petkus, Schlandsted, Ivanoff, and recently the Michigan Experiment Station has produced a winter rye which they have named Rosen.

This has been named after a student who attended the agricultural college there and who furnished some seed which came direct from Russia. It is a great mistake for any rye grower not to grow pedigreed winter rye, since all the tests which have been made show that it outyields common rye by from ten to fifteen bushels per acre. If you have any doubts about this ask some grower whom you may know who is growing pedigreed winter rye and then I am sure you will be convinced.

Barley

Some farmers do not like to grow barley because they say it is such a miserable grain to handle but perhaps you know better. Although the barley which you may know does have long, disagreeable beards which break off easily and stick to your clothes when it is handled, we must not forget that barley is a wonderful crop because it yields so well per acre and because it makes such good feed for all kinds of stock if fed in the right way.

Most of us associate barley growing with beer making. But now we must change our ideas on that point since the country has gone dry. Farmers are now realizing that barley makes an excellent grain feed for both cattle and hogs and for that reason we should not expect to see the barley acreage decrease but on the other hand it should increase.

Perhaps the most famous variety of barley is a six-rowed type, known as Manshury barley. It came from China into Germany about 1857. Some years ago a man from Iowa County, Wisconsin, was visiting in Germany and while there he became acquainted with a director of one of the German Experiment Stations. This man gave him some of the Manshury barley and he brought this small sample of seed back to Wisconsin and it is from this that all of the Manshury barley has been derived. The other name, Oderbrucker, is evidently nothing but a new name for Manshury barley which somebody has given it for they prove to be the same thing.

The Wisconsin Experiment Station has perhaps done more work in barley breeding than any other station and Wisconsin is now known as the leading state for the production of Pedigreed Oderbrucker or Manshury barley. But there are other kinds of barley which are used in various sections of our country. In Wisconsin, Dakotas, and Montana they grow what is called a two-rowed barley.

The leading variety of two-rowed barley is Chevalier, one which has a rather long, loose head. Another one is Svanhals, which has a shorter head, more erect, and more compact than Chevalier. These are two of the leading varieties of two-row barley but are of interest only to those whose condition limits them to two-row barley instead of six. For the states in the upper part of the Mississippi Valley there is no variety which excels the Pedigreed Oderbrucker or Manshury.

PETKUS WINTER RYE

Then there are a couple of barleys that are known as Hooded barleys on account of the peculiar little hood which is attached to the upper part of the kernel. Many times these are called awnless barleys. But it is better to call them Hooded barleys since there is a regular awnless barley.

Oats

Like all other crops, the kind of oats which you are familiar with is determined by your location. Usually we classify oats into five distinct groups according to the color of the hull, white, yellow, red, black, and gray. For all oat growers in the northern part of the country, varieties of the white and yellow group are by far superior because they are much better yielders and the market pays a better price for oats of these colors. While there are a great many varieties of oats there are some which

seem to have quite superior qualities.

Among white oats the Swedish Select has not been known for about a period of twenty years. It is grown extensively in all of the northern states from Montana to Maine and it has been estimated that at least fifty million bushels of Swedish Select oats are annually produced in the United States. This is a big white oat which is medium late in maturity. It is very pretty in threshed samples and in exhibits usually carries off many of the prizes. It is not the best kind of oat to grow on real rich soils because it gets so big and is very liable to lodge.

Many of the experiment stations have pedigreed strains of this variety and one of the leading varieties grown in Wisconsin is known as Pedigreed No. 5 which is an improved strain of Swedish Select.

Then there is another white variety that is worthy of mention. This is Wisconsin Wonder or Pedigree No. 1. It looks much like the Swedish Select but is not as coarse and the kernel is more slender in its shape. It seems to have one good quality that excels Swedish Select and that is the straw is stiffer and hence a crop of Pedigree No. 1 oats will not lodge quite as readily as will Swedish Select.

The Kherson oats is perhaps the most popular variety of early oats. It came from Russia in about 1896 direct to the state of Nebraska. Its qualities are very good. It is early, a good producer, and has a thin hull. It is a good oat for the richer soils because it is early and because it does not lodge as easily as do the large white varieties.

Corn

It is well known among those who are working with the juniors in their club work that corn is perhaps the most interesting crop to them.

Now, we want to say right here, that no junior can afford to enter corn club work who does not grow pure-bred corn because if there is any one thing that club work should stand for it is "purity". It is much more interesting to work with something which you know to be the very best in its line than it is to work with scrub stuff. Every state has its favorite varieties of corn and any junior interested can write to the experiment station and he can get all the information about corn which applies to his conditions.

A very favorite variety of corn in Wisconsin, Iowa, and even Illinois and Indiana is Silver King. Some of the highest yields which northern juniors have produced have been from this variety.

Then there is the Golden Glow variety which has reached fame, especially in Wisconsin, Nebraska, and the Dakotas. This variety was produced in Wisconsin about fifteen years ago and ever since that time there are thousands of acres of Golden Glow produced each year.

Juniors who live so far north where the growing season is short must confine their attention to varieties which mature early and hence they do not have such a large choice. But there are varieties even for these conditions. Such varieties as Wisconsin No. 8 and Minnesota No. 13 give the best results in the northern parts of Wisconsin and Minnesota, and even farmers who live farther south and could grow later varieties oftentimes favor these early ones because they are more certain of getting ripe corn.

It is always well to keep an ear to the ground and listen to the advice of the plant breeders, those who are doing the work in testing varieties and producing new ones. Just because one may be growing a variety which he thinks is very good it is no reason why he should not attempt to keep up-to-date and to get the very best that has been found. Every live junior who is interested in learning all that he can will do this and we assure you that it not only will be a greater pleasure to harvest the crops but it also means a fuller pocketbook.

During the month of May 202 cooperative creameries of Minnesota paid their patrons nearly two million dollars, the average price paid for fat being 64 cents a pound and the average receipt of fat per creamery being 14,487 lbs. for the month.

Why not put in a supply of butter for next season? A copy of Extension Bulletin 33 on "Making and Storing Butter for Home Use" is yours for the asking. The state college at Ithaca, N. Y., will send it.

The boy or girl who is not a member of a junior project club is likely to be lonesome. Are your boys and girls missing out on fun and instruction to which they are entitled?

Do you feel you need a bracer? Milk's a drink that needs no "chaser".

Junior Letters

Hoard's Dairyman Juniors:—I am feeding a calf and pig and I would be glad to know what some of the other juniors are feeding theirs. I feed my calf 18 lbs. of milk, 2 quarts of oats and I give it all the hay it wants. I feed my pig corn and buttermilk mixed with ground barley. I try to get tankge but I can not. We have 14 calves now, 7 bulls, and 7 heifers.

I was 11 years old last May. I made the 6th and 7th grades in 1 year and I am now in the 8th grade.

We bought 2 registered Duroc-Jersey gilts last fall and they had 20 pigs. I had some rabbits but I sold them all. I wrote the juniors a letter and told about them. After that I had several inquiries for rabbits but I sold them all around home.

My mother has about 150 chicks. We have Rhode Island Reds.

I wish some of the juniors would write me and tell me about their calves and pigs. My address is Route 1, Box 12, Union Center, Wis.

Richard K. Wagner.

Hoard's Dairyman Juniors:—The pony I had died Christmas but I have another. His name is Billy. I feed him oats, Sudan grass hay, and grass.

We have six work horses, 3 young mules, and a colt that was a year old Saturday.

We are milking nine cows now of which I milk two. We take cream to Comfort twice a week in the automobile.

We have not threshed yet but most everybody around here has. We feed green corn to the hogs.

Texas. Annie Blaschke.

Hoard's Dairyman Juniors:—We have a farm of 50 acres and are going to annex some more land to it. We keep pure-bred Ayrshires and sell our milk to the Plymouth Creamery System. It is owned by the farmers of New Hampshire, Vermont, and Canada. I have a registered Ayrshire heifer I bought at an auction. Her name is Lassie's Helen F. I have 4 shoats and a brood sow, 2 horses, and 4 cows. We are going to buy some more registered Ayrshires this fall. Well, I guess this is about all this time. I am 17 years old and 5 feet, 10 in. tall and weigh 165 lbs.

New Hampshire. William C. Graves.

Hoard's Dairyman Juniors:—I said I would write as soon as I became a junior.

I am interested in chickens. If I take care of the chickens father feeds my chickens and lets me have the eggs. I bought a new hen today. I have four hens and a pullet. I raised a hen and a pullet and bought the other three. We have about 140 Leghorn chickens.

We have eight registered Holstein cows and thirteen registered Holstein heifers. Mother has three full blooded bronze hen turkeys and a full blooded gobbler.

I would like to hear from some of the juniors. I will answer as soon as I get it. My address is R. D. 1, Kingsley, Pa.

Giles Adams.

Hoard's Dairyman Juniors:—I received the button, the fob, and the creed. The creed I believe every word on it is true.

On our farm we have 12 horses and three colts and a Shetland pony, Their names are Dido, Barnie, Dick, Billy, Teddy, Ned, Star, Lid, Dan. The colts' names are Molly, Sallie, Black Beauty. The Shetland pony is Jim. My father owns 90 or more head of cattle. I can't name them all here because there are so many. I know the name of all of them though. We have a Scotch Collie dog. Her name is Lassie. She has had four litters of puppies, 34 in all. My brother had two pigs; he butchered them and is going to get another one. He belongs to the pig club.

Vermont. Murray Dunsmore.

Do You Belong to the Juniors Club?

If you are a dairy farm boy between ten and eighteen years of age, and if your father or some member of your family is a subscriber to HOARD'S DAIRYMAN, we want you to join the HOARD'S DAIRYMAN Juniors Club.

The Juniors Club consists of several thousand boys like you, banded together to help each other get more pleasure and profit from farm life, and to have the advantage of associating with other boys who live and work and think as you do.

It costs nothing to join the club—and there are no dues. All you need to do to join is just to fill out the coupon and send it to us. We'll at once enroll you as a member and send you a watch fob, a coat lapel button, and the "Dairy Farm Boy's Creed". Do it now—then you'll soon be a full fledged member of the HOARD'S DAIRYMAN Juniors Club.

COUPON

A Dairy Farm of Real Value—An exceptionally productive dairy farm of four hundred thirty-eight (438) acres, located one mile from Chautauqua, N. Y., known the world over as a summer resort and educational center is offered for sale at $100 per acre, if sold by November 1st. The farm has never been leased, is carrying at present 97 head of pure-bred Holstein-Friesian animals, is beautifully watered, well located and exceptionally fertile. As a matter of good faith, the owner will pay one-half of the railroad fare of anyone from any place, who upon investigation fails to find that this farm has the local reputation of being at least one of the most fertile productive farms in the section. The owner is a manufacturer in Detroit. He has owned the place nearly twenty years. His reason for selling is to transfer his stock operations from New York to Michigan. Terms can be arranged and a discount will be given for cash. The property is free from all kinds of incumbrances. Arrangements can be made to buy a portion of the stock. G. E. WILDER, Gemmer Manufacturing Company, Detroit, Michigan. 5-4

160-acre New York farm $7,500; $3,000 down. Machine-worked fields, spring watered, new buildings alone worth amount asked for all. Will include 20 head stock and farm machinery. Must sell at once. If you want a money maker write BOX 324, care Hoard's Dairyman.

Let Your Own Eyes Decide

Study these pictures carefully. They show why Carbide Gas is used on more than 300,000 farms in preference to all other forms of lighting.

1. An oil lamp flame; large, wasteful, dim and smoky, consumes much of the life-giving oxygen from the air. Has an unpleasant smell and discharges soot into the room. *The clipping shows how ordinary newspaper type looks to normal eyes by lamplight at a distance of 12 feet.*

2. The Colt Carbide Gas Flame. Note its small size. Consumes far less oxygen than an oil flame. It is economical, bright, smokeless and odorless; gives the nearest light to actual sunlight—ten times as efficient as lamplight. *The clipping shows how ordinary newspaper type looks to normal eyes by Colt light at a distance of 12 feet.*

COLT TRADE MARK REG. U.S. PAT. OFF.

CARBIDE LIGHTING AND COOKING PLANTS

furnish this remarkable light to every room in the house and to barns and outbuildings too. Just a twist of the fingers—no matches needed—no more filling and trimming lamps.

Colt Carbide Gas is easily made right at home. It gives a hot cooking flame *when you need it.* It keeps the kitchen cool and clean and supplies a self-heating flat iron.

The Colt Plant is easily installed and requires scarcely any attention. It is economical, efficient and dependable.

"Yours for Real Tobacco"

says the Good Judge

Men are getting away from the big chew idea. They find more satisfaction in a little of the Real Tobacco Chew than they ever got from a big chew of the ordinary kind.

Costs you less, too—the full, rich tobacco taste lasts so much longer.

Any man who uses the Real Tobacco Chew will tell you that.

Put up in two styles

RIGHT CUT is a short-cut tobacco

W-B CUT is a long fine-cut tobacco

Association Notes

Muskingum, Ohio:—Of the 55 herds tested in this association, all except three use pure-bred sires. In June 3.3% market milk sold for $3.50 per cwt. The creamery paid 54c per pound for fat and milk retailed for 14c per quart. Bran is rated at $3.15 per cwt. and corn at $2.50.

North Crandon, Wisconsin:—Four unprofitable cows were sold or butchered during June and five cows sold to new settlers. Three members are feeding balanced rations showing an increase in production of about 30%. Pastures are not as good on account of dry weather and grasshoppers. All grain crops are good. Four herds were tuberculin tested, but no reactors were found. The creamery paid $.57 per pound for fat and the cheese factory 50c. Milk retails for 15c per quart, butter for 57c and 60c, and cheese for 25c per pound. Feed prices are: Dairy ration, $90 per ton; oil meal, $86; oats and peas, $76; oats, $66; hay, $24.

Wausau—Marathon, Wisconsin:—In June one pure-bred Guernsey bull was purchased and six cows sold to make room for better producers. This association is co-operating with the Guernsey Breeders' association in buying feed for next winter. Four members have started official testing. A few farmers are feeding their cows grain in addition to pasture. June market milk testing 4% sold for $2.60 per cwt., 6½c paid for each point above. The creamery paid 63c per pound for fat and the cheese factory 58c. Milk retails for 14c per quart, butter for 58c per pound, and cheese for 36c. Hay is rated at $28 per ton; silage, $6; bran, $50; middlings, $54; oil meal, $69; Wisconsin Balanced Ration, $70; International Dairy Ration, $51; gluten, $68; oats, $1.25 per bushel; and barley, $1.45.

Lake County No. 1, Illinois:—Every scrub sire has been rooted out and at present we have one hundred per cent pure-bred sires. Soiling crops are being fed by a number of the members to supplement short pastures. Most of the men are using home mixed rations, although there are still a few who persist in using the high priced ready rations. July market milk sold for $3.20 per cwt., testing 3.5, and 4c for each point above. The condensery paid 56c per pound for fat. Feed prices are: corn meal, $3.25 per cwt.; bran, $3; dried brewers grains, $3.50; cottonseed meal, $3.75; barley, $3; oil meal, $3.60; gluten, $3.60; oats, $3.90.

Vermillion—Champaign, Illinois:—A carload of oil meal was purchased in July. Thirteen "visitor" cows were sold. Market milk testing 3.5% sold for $3.50 per cwt., and 4c per point above. The creamery paid 90c per pound for fat. Milk retailed for 17c per quart and butter for 62c per pound.

Monona—Farmersburg, Iowa:—The third carload of cottonseed meal has been bought. Five cows were sold, and two pure-bred heifers and one Red Poll bull calf were purchased. Production is falling off on account of dry pastures. Most members are starting supplementing with grain. Nearly all of the silos were emptied last spring and scarcity of help prevents soiling except with dry hay. Cottonseed meal is rated at $70 per ton and oats at $60.

Platte, Boulder, and St. Vrain Valley, Colorado:—The condensery paid 70c per pound for fat in July, and the creamery paid 75c. Milk retails for 12½ to 15c per quart. Feed prices are: Alfalfa, $16 to $18 per ton; corn chop, $4 per cwt.; bran, $3; barley, $4.15; oats, $4.20; linseed, $5.25; cottonseed meal, $4.75; dried beet pulp, $1.75.

Posey—Gibson, Indiana:—Two "visitor" cows were sold in July. Several members are preparing exhibits for county fairs and some for state fair. The creamery paid 52c per pound for fat. Milk retails for 16c per quart, butter for 70c per pound, and cheese 45c. Hay is rated at $25 per ton; bran, $60; cottonseed meal, $72; and oil meal, $75.

Juniata County, Pennsylvania:—Members are trying to keep up production this summer by feeding balanced rations on pasture, and are getting good results so far. There has been a carload of cottonseed meal ordered. June market milk sold for $3.51 per cwt. The creamery paid 70c per pound for fat. Milk retails for 12c per quart. Cottonseed meal is rated at $90 per ton; bran, $65; ground oats, $66.80; corn and cob meal, $53; Union Grain, $78 to $80; Larro Feed, $77—$78; Peerless Dairy feed, $70.

Jackson County, Kansas:—Members who have been pasturing Sudan grass report excellent results in helping to keep up the milk flow and in economy. July milk sold for 28c per gallon. The condensery paid 54c per pound for fat and in addition 55c per cwt. milk; the creamery paid 56c per pound for fat. Bottled milk retails for 15c per cwt. Feed prices are: oats, 70c per bushel; chops, $3.60 per cwt.; oil meal, $4.60; bran, $3; alfalfa, $20 per ton.

Claremont and Lebanon, New Hampshire:—Two unprofitable cows have been disposed of. One pure-bred bull calf was sold by one member to a farmer who has never used a pure-bred bull before. Several members have installed lighting system and are

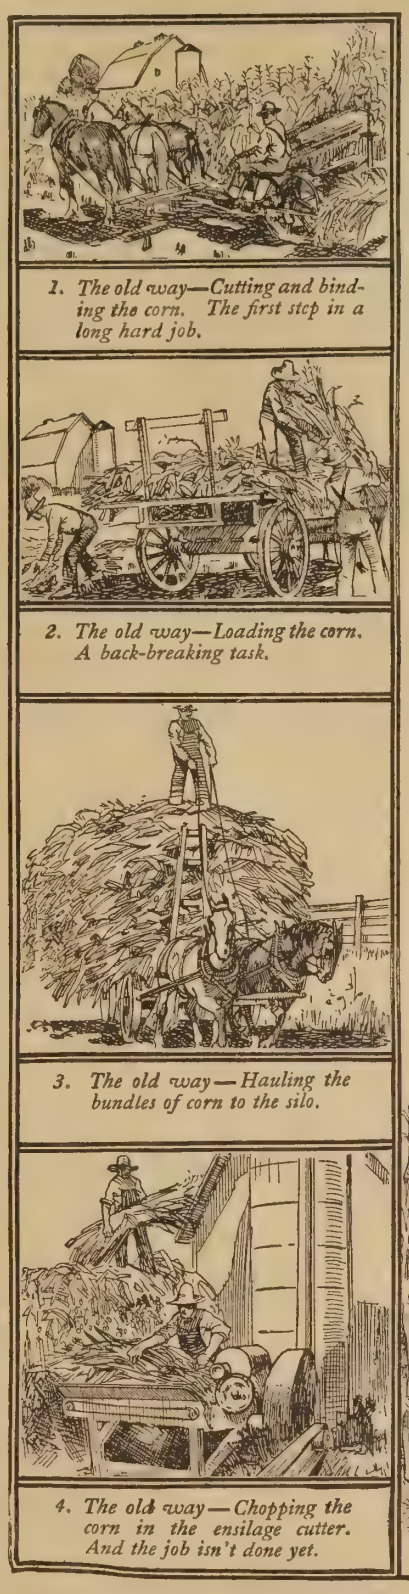
well pleased with them. Haying is pretty well along, although the weather has been somewhat unfavorable and good help scarce. July market milk testing 3.7% sold for $3.73 per cwt. and 6c per point above. The creamery paid 75c per pound for fat. Milk retails for 14c per quart and butter for 70c per pound. Feed prices are: Bran, $66 to $73 per ton; gluten, $83; cottonseed meal, $78 to $92; oil meal, $80 to $88; ground oats, $86; corn meal, $77 to $85; Stock Feed, $80; Ready Rations, $74 to $87; peas and oats, $6.

Johnstown, Colorado:—Owing to the scarcity of competent herdsmen, Tobey and Wailes sold their herd of 42 registered Holsteins to Letford and Crowley and to Whowell and Polley. The average price was $350 per head. The herd remains in the state and in the Johnstown association. The herd of 22 cows has an average of 466 lbs. fat for the year ending May 1, 1920, in this association. July market milk testing 4% sold for 2.80 per cwt. The condensery paid 70c per pound for fat and the creamery paid 59c, Milk retails for 15c per quart. Alfalfa (second cutting) is rated at $12 to $18 per ton; corn silage, $7 to $10; ground oats, $71; ground barley, $69; ground corn, $68; ground milo maize, $64; dried beet pulp, $1.75 per cwt.; bran, $2.70 to $3.20; cottonseed meal, $4; oil meal, $4.40.

Minnesota Testing News

This is the first of a series of monthly letters to be issued by this office for the purpose of giving wider publicity to the official test work which is being carried on in Minnesota. This initial issue is introductory in character, and the plan is to report in these letters the number of breeders testing, number of cows on test, number of supervisors employed, and also tabulate the highest records completed during the previous month. The scope of the letter will be enlarged to include items of interest to breeders of dairy cattle, and special mention will be made of cows completing notable records.

We invite the co-operation of the breeders, supervisors, and all interested parties in making these monthly reports more valuable by offering suggestions and submitting information for publication. There are many daily occurrences of general interest which could be disseminated in this manner, and it will serve to bring the breeders of the state in closer contact at least once a month.



Record prices of pure-bred cattle here and elsewhere have attested to the value of official records, and that Minnesota breeders are fully aware of this fact is apparent by the large increase in volume of test work done during the past year. No investment which the breeder makes will return him as much on the dollar as the money he spends for official testing.

The following statement summarized last year's official testing. In round numbers they show an increase of about one hundred per cent over the preceding twelve-month period.

During the year ending June 30, 1920, tests were supervised for 182 Holstein breeders, 27 Guernsey breeders, 13 Jersey breeders, 4 Shorthorn breeders, and one breeder each of Ayrshire, Red Polls, and Brown Swiss—a total of 229 breeders.

There were 4,119 two-day tests on Holsteins, 1,158 on Guernseys, 676 on Jerseys, 154 on Shorthorns, 84 on Red Polls, 12 on Ayrshire, and 4 on Brown Swiss—making a total of 6,207 two-day tests. In addition the Holsteins provided 1,053 seven-day tests, 81 30-day tests, and one 60-day test.—M. H. Fohrmann, Superintendent Official Testing for Minnesota.

RONNING ENSILAGE HARVESTER

1. The old way—Cutting and binding the corn. The first step in a long hard job.

2. The old way—Loading the corn. A back-breaking task.

3. The old way—Hauling the bundles of corn to the silo.

4. The old way—Chopping the corn in the ensilage cutter. And the job isn't done yet.

Get One—

You Can If You Act Today

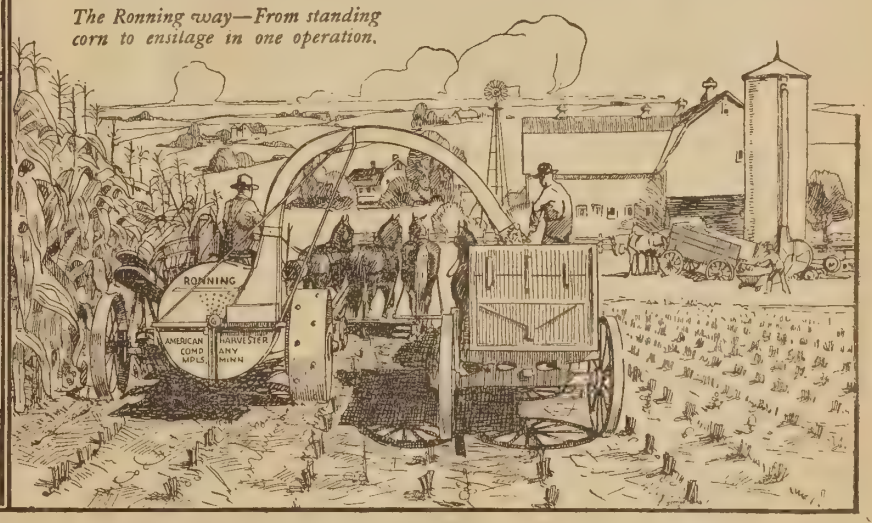
TWO weeks ago we announced that we would do everything in our power to fill the orders of dairy farmers who wrote or wired us at once. The response has been tremendous. Dairy farmers all over the United States have written saying: "I'll do anything to get a RONNING ENSILAGE HARVESTER in time for silo-filling this year. If I can't get it my silo will have to stand empty."

We took care of these dairy farmers to the best of our ability. We realize that dairymen need their silos filled more than any other class of farmers. We are giving them special attention.

If you will write or wire us at once, we will try to get a RONNING to you in time for silo filling. We know how short of help you are—we know how badly you need a RONNING. We are publishing this announcement to give you a final chance to get one.

From Corn to Ensilage in One Operation

The RONNING ENSILAGE HARVESTER actually takes your green corn as it stands in the field, reaps it, chops it and loads it into the wagon box ready for the silo all in one operation. Three men and three half grown boys can put up as much ensilage as 10 to 12 men working the old way. No twine bills—no additional machinery—fewer teams—only half as large a crew to pay, house and feed. And the job is all done at one time.



Write or Wire

This is your last chance. Write—or better still—wire us today. We will put you in touch with the distributor near you and will send complete information. If it is humanly possible we will get a RONNING to you in time for ensilage harvesting this year. But you must act at once.

American Harvester Company

1738 Central Avenue Minneapolis, Minnesota

The Ronning way—From standing corn to ensilage in one operation.

Oregon Development

HOARD'S DAIRYMAN:—The Ochoco project is now nearing completion and will be finished next month. There are 22,000 acres of land under this project which are producing good crops this year and will encourage many farmers to go into stock raising and dairying. This land now under the ditch used to be called "Poverty Flat", as it never produced a crop but once in four or five years and the settlers were poverty stricken. Many new fields of alfalfa were started this spring and are showing up fine, also all kinds of grain.

Crook County has always been considered a good stock country with plenty of free range, but the settling up of large territories by homesteaders has brought about many changes. The land is being brought up as fast as possible and fenced and the scrub cattle have to give place to the pure-breds and high grades. The large stockmen have been up against a hard proposition the last two years with the high price of hay and are selling off all of their inferior stock and only aim to keep enough good stock for the amount of feed they can produce on their own land. This will also cause a hardship for the hay ranchers who heretofore have depended on the stockmen to buy their alfalfa in the winter.

All these changes are paving the way for the dairy cow and it will only be a short time before many hay ranchers will be compelled to go into dairying or sell out and make room for those that will dairy. We can grow rich hay here which, when fed to beef cattle without any grain, produces prime beef. It is equally good with the dairy cow. Many cows are making good records here, fed mostly on hay with very little concentrates. Some fine pure-bred herds are established in this county—mostly a beef type and a number of good dairy herds to blaze the trail for more and better farming.

Oregon. W. FREUND.

TABER LINED SILO

"LINED" (Pat. App. for) Acid-Proof Lining keeps air out—and moisture and juices of corn away from staves. Prevents rot—freezing and spoilage.

Shipped in 24 Hours

Made of *absolutely clear* Long Leaf Yellow Pine boiled in Creosote. Acid-Proof Lined, Painted outside, Double Anchored. Won't blow down.

Non-Shrinkable

Rot-Proof Acid-Proof

No shrinking or swelling of staves. No frozen silage. Finest circle doors and frame.

Lowe's

A dollar or two keeps your truck and tractor new

Buying a new truck or tractor is one thing. Keeping it like *new* is another. One takes a roll of bills—the other takes but one bill off the roll. One is good for the other fellow's business—the other is good for your business. What's good for your business, is good for you.

It's surprising what a little paint will do to keep your trucks and tractors new.

We make a paint that's the best paint for trucks, tractors, wagons and machinery that we know how to make. Knowing the reputation of Lowe Brothers' Paint, that's about all you need to know about this particular paint.

You can buy Lowe Brothers' Paint from the one best dealer in each town. If you want some sound sense paint *facts*, send direct to us for them. Just as sure as corn grows on a cob, some of the facts will make you open your eyes to the money to be saved by a half dozen or so paint savings.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Failing Cow

Six weeks ago one of my pure-bred Holstein cows gave birth to twin heifer calves. She is now two years old. Before the calves were born she was in fair physical condition, but ever since calving she was exceedingly poor in flesh. Her udder is still somewhat congested and she gives only twelve to fourteen pounds of milk per day.

Milwaukee, Wis. A. H. F.

If it has not been done you should have this cow tested with tuberculin and at this season of the year the intradermal method of testing would be preferable. If she does not react then a trained veterinarian should examine the womb and ovaries and if necessary treat for pyo-or endometritis, which we suspect possibly may be present, following the tardy expulsion of the afterbirth. That probably would be due to infection with the contagious abortion disease. Meanwhile flush out the vagina, every other day, with lukewarm, boiled water containing 30 grains of permanganate of potash to the gallon. Internally give her twice daily 20 grains of quinine, 30 grains of powdered nux vomica and 1 dram of powdered gentian root, in half a pint of thin gruel, well sweetened with molasses.

Abortion

I have six cows open and want to breed them right away. One of my cows lost her calf at about three months; another at about seven months. The first one I had her blood tested and the report came back that her blood showed abortion. She lived about three weeks and died. Can you determine the disease by blood test, and is vaccination successful?

Belton, Mo. J. A. McD.

The blood test determines whether or not contagious abortion disease infection is present in the blood; but it does not indicate whether cow has aborted, will abort, or when she will abort. It also determines presence of infection in the blood of a bull, but that does not indicate that he can spread abortion infection by service. Vaccination has not, thus far, proved satisfactory as a means of combating the disease, but it may be worth trying, if the local veterinarian has had good success in its use. See other recent answers regarding abortion.

Indigestion

Would you like to tell us what ails our heifer 4 months old? Am feeding separated milk with Blatchford calf meal, 4 lbs. at a feed, no meal and cold at noon. Has had only the one attack we know of. He will be still and then kick and paw with all four feet. Will turn on other side and do the same way.

New Mexico. J. J. L.

Physic the calf with castor oil and then feed more carefully. For a time mix an ounce of limewater in each pint of milk fed. Make the limewater by slaking a lump of caustic lime the size of a walnut in a quart of water. Allow sediment to settle and then use the clear liquid. Keep all feeding utensils scrupulously clean. Have the milk blood warm at feeding time and make calf drink slowly. Remove separator foam. Change to whole oats, bran, and oil meal, fed dry, in addition to fine hay, or grass.

Boils

I would like your advice in regard to some ailment of my cows' udders which I have suspected might be garget, but am not sure. A small lump appears on the teat where it joins the udder. This lasts a week or ten days and then disappears to appear later on another teat in the same manner. I have had two cows which stand close together affected in this manner. They are normal in every other way and the milk does not seem to be affected.

Denton, Mont. E. R.

Pus infection is the common cause of such a condition as you describe and it is liable at any time to cause ruinous cases of garget. For that reason isolate affected cows and twice daily bathe the affected part with hot water containing all the boric acid it will dissolve; then dry gently and apply a little 10 per cent oleate of mercury ointment. If a boil starts paint it with tincture of iodin daily and open when soft; then continue using iodin until it heals. Cleanse udders and teats before milking and milk with clean, dry hands.

Barrenness

I would like your advice on getting cows safe with calf. We have a hard time getting some of our cows with calf. Some skip a period of 3 weeks, others 6 weeks, sometimes 9 weeks. They come in in fine shape. We have two herd bulls. Our youngest one nearly always gets them the first time. Our senior herd sire we have in partnership with another breeder two miles away. He has a little of the same trouble, but not so bad. This bull is generally real fat, which might be the cause. He is most always quick about serving. What would be your advice to keep the bull less fat or serve cows more than once?

Grand Rapids, Mich. J. C. B.

Put the herd bull to work in harness, or a tread power, or at least make him take plenty of exercise every day by butting at a big empty barrel or block of wood hung by chains from an overhead beam in his paddock. Syringe out his sheath with a mid antiseptic solution before and after each service. The abortion disease infection is the probable cause of the difficulty in getting the cows in calf. Before breeding any cow syringe out her vagina daily with lukewarm, boiled water containing 30 grains of permanganate of potash to the gallon. That also will serve for disinfecting the bull. Continue the vaginal injections every other day after service, until it is seen that the cow is not going to come in heat again.

Washington, D. C., Weekly News

[Special to Hoard's Dairyman]

WASHINGTON, August 9—There have been no public developments during the past week in the milk controversy in this city. An attorney named O'Brien has been quoted in the newspapers as having filed with the Department of Justice a complaint on behalf of consumers of milk, charging a conspiracy on the part of the Maryland—Virginia Milk Producers' Association members. Who he represents is not yet plain, but it is reasonable to suppose that distributors are interested as consumers. The facts are that the milk producers' association is securing contracts with its members whereby they sell their milk to the association, for a period of a year, under a well tested form of sale contract, the same as is in force in Baltimore milk territory. Dr. Harvey W. Wiley, president of the milk producers' association, refutes all the O'Brien charges positively by showing that there is no conspiracy, no effort to keep milk from the city, and nothing else involved except the contract for the sale of milk by co-operative marketing, as indicated.

Washington health regulations permit no milk to come into the city for sale, except from tuberculin tested herds. This is one of the facts alleged in the O'Brien statement as an evidence of "conspiracy". Dr. Wiley asserts that this indicates that the attack on the milk producers is in reality an attack on the health regulations, and an effort to let the bars down for the introduction of uninspected and unlicensed milk into the district.

The whole controversy may have a desirable result in one particular, although, if this happens, it will compel the milk producer's organization to fight a law suit through the district courts. I refer to the possibility of having this clear cut case tried out in the federal courts to a decision as to whether or not a co-operative marketing contract, such as is involved here, is or is not a violation of the Clayton amendment to the anti-trust law. This question is involved in the effort to secure the Volstead Substitute for the Capper—Hersman bill, and it is also involved in the so-called "California plan" of co-operative marketing just now under national discussion as the result of the recent grain and live stock marketing conference in Chicago, where this plan was proposed by Aaron Sapiro of California as the proper method of handling all staple farm products. If the effort to put this plan into effect here should be decided as a "monopoly in restraint of trade" it would be the signal for a nation-wide effort either to amend the present statue, or else work out another method of co-operative marketing. The issue is very clear cut in this particular, and it may be the opportune time and case for a quick and clear decision.

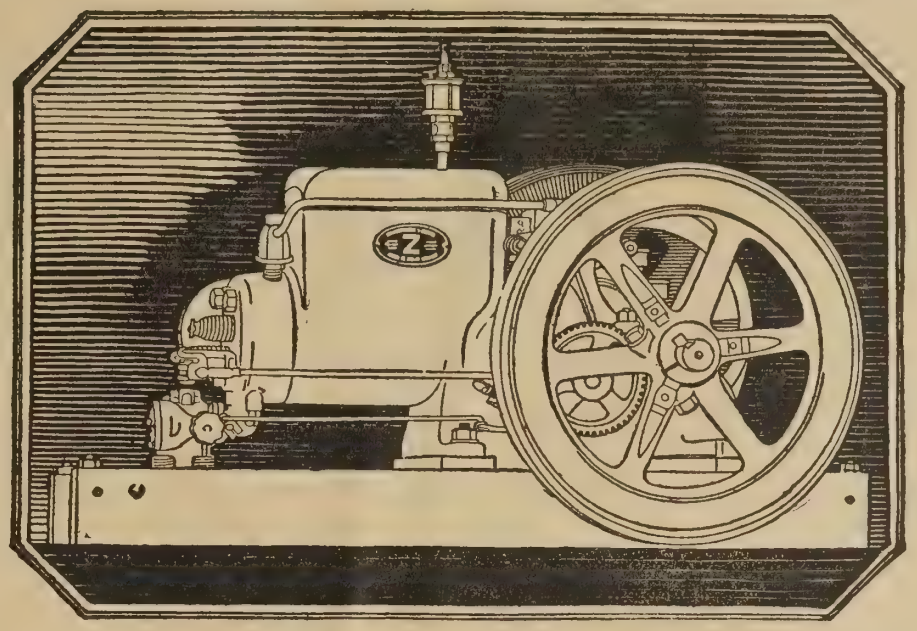
⚜

What about Hebe? Information as to a new and extensive advertising campaign to market this much discussed product is coming to attention both in the columns of the farm papers and the city papers. The fiction behind which this product hides should be punctured so every one understands it, not as an attack on Hebe, nor as a criticism of its manufacturers, who are scrupulously careful to sell it for what it is, a mixture of skimmilk and vegetable and other oils, but as a statement of the actual facts. The sale of Hebe does not open a market for a farm product; it closes a market for a farm product, for it is sold not as a separate product, but in direct competition with condensed whole milk. Every can of Hebe which is sold comes very nearly preventing the sale of an equal can of condensed whole milk. The trouble with Hebe in spite of every camouflage is that it is an imitation product, in the same class with oleomargarine and nut margarine. It makes its appeal to the public because it contains a fat, in spite of the fact that that fat does not contain the vital elements which set milk fat or butterfat out and above every other human food in importance. The undivided attention of the public must be centered on this vital value of butterfat, that which makes the dairy cow the foster mother of the human race, and when this is understood, then the necessity for legislation to protect whole milk, condensed whole milk, and butter from imitations which do not contain any appreciable amount of butterfat, will be well understood. Hebe stands on the counters of hundreds of grocery stores alongside of the recognized brands of condensed milk. A customer who asks for "condensed" or "evaporated" milk is asked which she wants, "Heebe" or some other brand, and on learning the price decides, without the necessary information by word of mouth—no matter if the label says that Hebe does not contain butterfat. What about Hebe?

⚜

Farmers' Bulletin 717, recently issued by the Division of Home Economics, on the uses of milk as a food contains a very strong endorsement of the vital principles in milk, although even this bulletin which is a strong endorsement of the value of dairy foods as a whole, veers off without using the commonly accepted terms and names for the vitamines, now so widely recognized. What this bulletin says about the use of butter in place of other fats in the child's diet, deserves the widest reading and approval.

Louisiana Dairy News



Mr. E. C. Jefferson has been employed by the Extension Department and took up his new work as Dairy Specialist August 1. Mr. Jefferson is filling the position recently made vacant by the resignation of Mr. H. C. Vetter.

Mr. Jefferson is a graduate of the Louisiana State University and has had charge of the large dairy herd owned by the Estate of H. C. Minor, where he has rendered most valuable and efficient service and the experience gained while working with this dairy herd has been of much value to him and especially fits him for extension work.

The dairy farming operations at the Minor Estate are among the largest in the country consisting of both pure-bred Holstein and Jersey cattle and in his work with this herd Mr. Jefferson has had most every kind of experience that is involved in the operation of an up-to-date dairy farm, and the great progress that has been made there under Mr. Jefferson's supervision should be sufficient evidence to the dairy farmers of the state that he is fully qualified to render them most valuable service.—C. H. STAPLES, Louisiana University.

Hog cholera is the swine raisers' chief enemy. Inoculation locks the stable before the horse is stolen.

FAIRBANKS-MORSE "Z" FARM ENGINES

As Clean Cut as a Thoroughbred

The clean-cut business-like design of the "Z" Engine was not just accident. A farm engine, to be efficient, *must* be properly designed. The "Z" has graceful, natural lines—free from geegaws.

The parts are strong—weight where weight is needed. Strains foreseen—contact parts case hardened—*all* parts carefully, precisely made by accurate machine work.

Looks like a thoroughbred—*is* one. Delivers a steady flow of power—runs smoothly—operates economically. Correct design and precision methods give the "Z" its built-in quality. It is a mighty pleasing engine to look at.

Other "Z" features are: Runs on kerosene, as well as gasoline; Bosch magneto; more than rated power; parts interchangeable; long life.

Let your nearby dealer show you why you should have a "Z."

Feeding and Caring for Swine

(Continued from page 153)

This well shows the high value of pasture over one of the best dry-lot rations (corn and tankage, for growing and fattening pigs.

Amount of Grain to Feed on Pasture

Even on the best pasture, young pigs fed no grain will make little or no growth and soon become stunted. It is very important that enough grain be fed to keep them growing vigorously. This will take at the least 2 to 3 lbs. of dry feed for each 100 lbs. live weight per day. In 1916 we fed one lot of pigs on good alfalfa pasture 2 lbs. of corn and tankage daily for each 100 lbs. live weight, another lot 3 lbs., while a third lot was self-fed all the corn and tankage they would eat. When new corn was ready the first two lots were finished on all the new ear corn they wanted. Even with corn and tankage high in price, the self-fed pigs made more money, as they actually required less corn and tankage for 100 lbs. gain. The pigs fed the two per cent ration received too little grain and some became stunted. This trial and others show that under Wisconsin conditions it pays best to feed growing, fattening pigs on pasture all the grain they will eat. We prefer to use a self-feeder for everything except the breeding herd.

Feed Tankage or Skimmilk on Pasture

Corn and ground barley must be supplemented by tankage, skimmilk, or buttermilk even on the best hog pastures as alfalfa, clover, rape, or oat-pea-rape mixture. Whey alone will balance ground barley and probably nearly balance corn if fed in sufficient amount on good pasture.

Best hog pastures for Wisconsin are:

1. **Oat-pea-rape mixture.** In two years' trials this proved the best annual crop tested. Seed at usual time for oats. Drill mixture of one bushel oats and one bushel field peas per acre; and at same time broadcast four lbs. rape per acre. Pasture ready in June or when peas are well podded. If not pastured too heavily will furnish grazing until hard freeze.

2. **Rape.** Next best annual crop. For early pasture seed as early as possible, broadcasting at rate of 5 lbs. per acre. Begin to pasture when rape is a foot high. Lasts till hard freeze.

3. **Red clover.** Excellent long season pasture crop. Clover furnishes pasture from early spring till fall.

4. **Bluegrass or native pasture.** Bluegrass (often with some white clover) furnishes earliest spring pasture, but not much forage in midsummer and one of the first three mentioned pasture crops should also be supplied.

5. **Alfalfa.** Alfalfa is an excellent forage for pigs, but pigs may not be so good for the alfalfa. Trials are in progress to find how many years alfalfa can be pastured by hogs before it is killed out.

6. **Soybeans.** A good crop for late summer and fall. Drill at corn planting time at rate of one-half to two-thirds bushel per acre. Don't turn pigs on until beans are formed in pods as chief value of forage is in the beans and not the leaves.

Hogging down corn is often an economical way of fattening pigs in the fall. In corn which is to be hogged down, broadcast 3 lbs. of rape per acre at last cultivation. Many plant 1 lb. of pumpkin seed per acre in addition which is not a bad idea.

Barley for Fattening Pigs

Due to the large demand in the past for barley for malting purposes in this state, this grain has been for the most part grown as a cash crop instead of being fed to live stock on the farm. For this reason many Wisconsin farmers do not appreciate the high value of barley for stock feeding.

To determine the relative value of corn and barley for fattening swine and to find the best methods of feeding barley to pigs, three feeding experiments have been carried on at the College of Agriculture this year, three carloads of pigs being fed in all. These trials have shown that barley is an excellent feed for pigs, especially when fed with dairy by-products or tankage. They point out the great possibilities for pork production in Wisconsin through utilizing our high grade pedigree barleys for feed.

In these trials one lot of pigs was self-fed shelled corn and tankage and another lot was self-fed ground barley and tankage. With feeds at market prices last winter, the feed cost of 100 lbs. gain was $11.51 on corn and tankage and $10.10 on barley and tankage. Ground barley was worth 5.5 per cent less than shelled corn per 100 lbs. for feeding hogs. Deducting the cost of grinding (5 cents per bushel), barley before grinding was worth 10 per cent less than shelled corn. With shelled corn at $1.50 per bushel or $2.68 per 100 lbs., barley is worth $1.16 per bushel, or $2.41 per 100 lbs. for feeding hogs, before grinding.

Our trials show plainly that barley should be ground for hogs. A lot of pigs fed soaked whole barley and tankage required 42 per cent more barley and 50 per cent more tankage for 100 lbs. gain than a lot fed ground barley and tankage.

Barley and Dairy By-Products Excel

In one trial several lots were fed to compare the value of various supplements to barley. Wheat middlings and linseed meal made rather poor showing, the pigs gaining only about 1.2 lbs. a head per day. Tankage gave much better results, the pigs gaining 2.0 lbs. daily. Skimmilk, however, was still better. Pigs fed about 1 lb. of skimmilk for each pound of barley gained 2.1 lbs. a day. With ground barley at $.92 per bushel, skimmilk was worth $.68 per 100 lbs.

The surprise of the trial came in the results from barley and whey. Pigs fed about 2 lbs. of skimmed whey for each pound of ground barley gained 2.5 lbs. per head daily, actually more than any other lot. The feed cost of 100 lbs. gain was only $9.31 for this lot. Whey was worth $.44 per 100 lbs.

These pigs weighed 129 lbs. at the start. Had they been younger, a greater proportion of skimmilk or whey would have been needed to balance the ration.

In the barley growing sections and especially in those dairy sections where most of the corn goes into the silo, these discoveries are of great importance. It is apparent that corn can be economically replaced with ground barley and that the great dairy by-products are the most valuable supplements. As to the quality of pork produced, it is interesting to note that Danish bacon produced on barley has long been considered the finest in the world.

SWINE

REGISTERED DUROC-JERSEYS

We are offering **For Sale** until **October 1st,** Spring **Duroc Gilts** and **Boars,** a number of Fall gilts and a number of brood sows including sows from **King Orion** and boars and gilts from **Crimson Orion Cherry King 2nd.** No better **Duroc** blood to be obtained. N. B. It will help us to assist you, if you will state in your inquiry size of herd, production of same and price you wish to pay.

POLLED JERSEYS

Breeders' names and Spillman's "Inheritance of the Poll Character in Cattle" mailed free.

CHAS. S. HATFIELD, Secy, R4, Box 5, Springfield, Ohio.

Sultan of Rockland 121150 R. of M.

Son of Eminent's Pilot, Gold Medal sire, two of whose daughters won Gold Medals as three-year-olds, and whose fourth Gold Medal daughter is full sister to Sultan of Rockland.

Out of Sultan's Nelly of St. Martins, R. of M. 598 lbs. butter, 85% fat, and dam of one Gold Medal cow, Eminent's Nelly Sultan 892 lbs. butter, full sister to Sultan of Rockland.

Sultan of Rockland has six daughters in R. of M. as two-year-olds, records 556 lbs. butter at 1.11, 490 lbs. at 2 years. He sired the bull "Glen Tana Stoke Pogis" that Sharp sold to Ayredale to be used on the World Champion cows.

We are replacing him with his own son, because we believe the son is better than the sire. Sultan of Rockland was dropped October 20, 1913, so he is just seven years old, and his sire did his greatest work after that age. He is a bull of proven ability, and proven better than three-fourths the registered bulls in the country. We cannot use him and give his young son a chance and so will part with him, if he can go into a herd where he can continue the good work he has begun.

Glen Tana Farm Dairy, - Spokane, Wash.

Four World's Record Cows at Ravinia

You Want Bigger Cream Checks

You may like a cow for her looks but she pays for her feed bill in milk.

Ravinia Ayrshires

are beautiful to look at too; but the big thing about them is that they "milk like a pump."

They have proved this by the world's records they have made; and will prove it to you in the bigger cream checks you get from them and from the herd you can breed out of them.

We can tell you some things about increasing your cream checks that you ought to know, and we'll be glad to do it. Get some paper and write us a letter right now about your breeding problems.

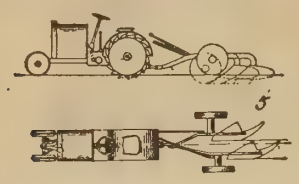
When writing advertisers please mention Hoard's Dairyman.

Inventions and Appliances of Interest to Agriculture

Artificial Bait

The bait here is stamped from sheet metal with flukes or upturned projections and is covered with luminous paint. It is attached loosely to the

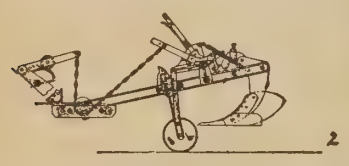


bait pan so that it will oscillate in waves or rotate in running water.

(Alexander Berg, St. Louis, Mo. U. S. Patent 1,319,832.)

Tractor

This small tractor is only two furrows wide and as a result can pull a two furrow plow without side draft and can travel entirely on unplowed

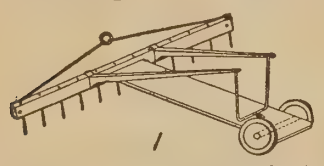


land while doing so.

(Hudson Motor Car Co., Detroit, Mich. U. S. Patent 1,305,433.)

Power-lift

The new feature here is that each plow of the gang is raised horizontally and therefore the points do not

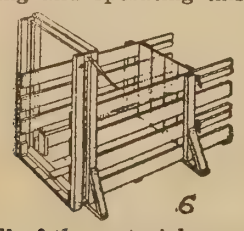


strike obstructions or gather trash.

(Avery Co., Peoria, Ill. U. S. Patent 1,312,281.)

Brush Rake

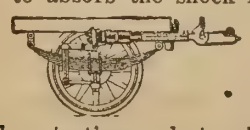
This rake is used to gather up vine cuttings and prunings in an orchard. The driver stands on the platform, which is hinged to the head, and lifts



the handles to discharge the brush in rows convenient for loading or burning.

(Wm. Duncan, Fresno, California. U. S. Patent 1,323,460.)

Hog Breeding Gate



Farmers' Bulletin 966, "A Simple Hog Breeding Crate", gives directions for making and operating this crate,

and a bill of the materials needed for its construction. Write for it to: Superintendent of Documents, Washington, D. C. It costs five cents.

Trailer Truck

The trailer truck shown here is designed for trailers which are to be connected in long trains and are the same at both ends. The improvement lies in the draw bar which has strong springs to absorb the shock incident

to sudden starting and stopping.

(Warner Mrg. Co., South Beloit, Ill. U. S. Patent 1,304,216.)

Canada. C. J. LYNDE.

Ringworm

Kindly advise whether you have ever had trouble with ringworm on cattle. If so, please give reliable treatment for same.

Watertown, Wis. F. D.

Ringworm is one of the commonest skin diseases of cattle and especially of calves. It is caused by a vegetable parasite that also lives on damp walls and woodwork. Isolate affected cattle. Cleanse, disinfect, and whitewash stables and all rubbing places. Treat by perfectly removing crusts and scabs, if necessary, first saturating daily with sweet oil, then apply tincture of iodin twice daily.

RED POLLED

August 11th

Public Sale

August 11th

We are offering at public sale August 11th at 10 A. M. at the Jean Du Luth Farm, Duluth, 80 of our best Red Polls. "The Home of the Ormsbys."

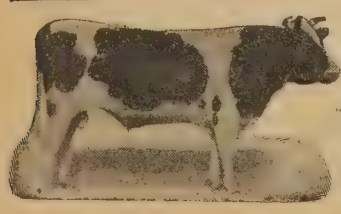
Use A Son of "Piebe"

from one of our good year record cows to head your herd. He will bring what you want—better individuality and increased production.

Piebe Laura Ollie Homestead King is, as you know, the phenomenal present day sire with 7 daughters that average over 20,000 lbs. milk in a year as 2-year-olds. He is a show bull as well, and his sons are as good.

We have one or two left that are almost of serviceable age. Write or wire today if you are interested.



MINNESOTA HOLSTEIN CO., V. S. Culver, Sec'y & Mgr., Austin, Minn.

Lola Segis Pontiac Homestead

the highest record bull in southern Minnesota, heads our herd. His sire, Piebe Laura Ollie Homestead King, has more daughters that as 2-yr.-olds have produced 20,000 lbs. milk in a year than any other. His dam, a 34-lb. 4-year-old daughter of King Segis Pontiac Count, has 3 records averaging 33 lbs. and has made over 1,000 lbs. in 1 year. We have a few serviceable bulls and younger from A. R. O. dams for sale.

Clover Lea Farm, W. W. Walker, Owner. Austin, Minnesota

THE LASHBROOK HERD

Headed by SIR WALKER SEGIS HOMESTEAD, first prize yearling bull, Chicago and Waterloo, 1919. His dam, Beauty Beets Walker Segis, made 25,343 lbs. milk, 1,040 lbs. butter in one year, World's Record for Senior two-year-old heifer. Her sire, KING SEGIS PONTIAC COUNT. We have several choice bull calves, two to five months old, from A. R. O. cows or cows on yearly test. $400—$500 apiece. Send for pedigrees and photos.

A. J. LASHBROOK, NORTHFIELD, MINN.
Herd Federally Accredited

Sir Korndyke Ormsby De Kol 15th—21 Months Old

His sire is a son of Sir Korndyke Hengerveld De Kol; 51 A. R. O. daughters, one of whom has a 7-day record of 39.56 lbs. and several above 1000 lbs.

His dam has a record of 23.778 lbs. and now on yearly test.

Geo. H. Elwell, - Minneapolis, Minn.

If You Could See

the daughters of King Segis Pontiac Fayne Star, you would be impressed with their uniformity and type. You cannot get his daughters for love or money but you can get one of his sons. The bull circular tells all about them,

FLECKS FARMS, - Faribault, Minn.

Serviceable Sons of Dutchland Aaggie Tidy Prince

I have three of these youngsters for sale, all ready for service and from A. R. O. granddaughters of S. P. O. M. Their sire is from a sister to Tidy Abbekerk Prince and already has a good list of tested daughters, including one above 36 lbs.

Write today for complete information.

E. J. BROSIOUS, - - Stillwater, Minn.

Grandsons of Sir Pietertje Ormsby Mercedes

The sire is Sir Pietertje Ormsby Mercedes 22d, a son of Minnesota's first 1000-lb. cow. These bulls are all nicely marked, straight top lines. Very good individuals from good A. R. O. dams.

For pedigrees and prices, write

O. J. GROVER, - GLYNDON, MINN.

COME TO BISCAY

FOR SALE!

Segis Pontiac Black Hawk

BORN FEBRUARY 7, 1918

A son of a 29-lb. sire and from a 24-lb. cow. A grandson of the "marvel of all sires", KING SEGIS PONTIAC COUNT. The daughters of the latter hold more World's records, (6) in the regular divisions than those of any other two sires. He already has (6) daughters with year butter records above 1,000 lbs. and is the only sire to have all daughters with year milk records above 20,000 lbs. Write us for pedigree and price.

Lake Meadow Farm, - Wayzata, Minn.

Pure-bred Holstein Females

In order to make room for fall calves, we are offering a choice lot of heifers from three months to two years old, some bred to freshen this fall and winter, in excellent condition, well grown and good individuals. Popular A. R. O. breeding and sold on a money back guarantee, priced reasonable for quick sale.

Blumecrest Farm, Maple Lake, Wright Co., Minn.

BULLS—Two of Them.

Ready for service. One light and one medium in color. One sired by our DUTCHLAND CREAMELLE COLANTHA LAD, from a good daughter of SIR WINANA BEETS SEGIS. The other sired by SIR WINANA BEETS SEGIS from a daughter of SEGIS JOHANNA GRAHAMHOLM. Both cows are on yearly test now and are making good records.

Don't buy a bull until you have seen and studied the pedigrees, pictures and prices on these youngsters. They are good ones. GRAHAMHOLM FARMS,

H. R. Searles, Mgr. Rochester, Minn.

Mankato Holstein Farms

OUR HERD BULLS

King Colantha Ormsby Bess, a Sir Pietertje Bess Burke Combination. Nine dams average over 1,000 lbs.

A son of Ormsby Korndyke Lad. Nine daughters over 1,000 lbs. butter, eleven over 22,000 lbs. of milk.

A son of Sir Pietertje Ormsby Mercedes 14th, that great transmitting show sire.

(A Federal Accredited Herd)

Ready For Service

Iowana Pontiac Homestead 267584, a son of OAK DE KOL OLLIE HOMESTEAD 85529, and therefore a brother to Piebe Laura Ollie Homestead King, (5 20,000-pound two-year-old daughters). His dam, Iowana Aaggie Pontiac Fayne, is a daughter of SIR JOHANNA FAYNE 42147, (8 20,000-pound daughters) has a record of 22.9 pounds in seven days as a four-year-old and is now doing well on yearly test. Her dam is a great foundation cow with over 750 pounds butter in a year. Buy him now as he will undoubtedly be worth more money when his dam finishes her year. Price $750; send for pedigree and photo.

Our herd is under Federal Supervision.

IOWANA FARMS, - DAVENPORT, IOWA

Do You Want

A 30-lb.—1000-lb. Ormsby Bull?

If you want one of that kind—and a real individual, write for our sale catalog. We are moving our herd to California and rather than take these bull calves we are offering them at sacrifice prices.

They are sons of Sir Ormsby Skylark, the sire of Duchess Skylark Ormsby, and they're from cows with records of from 27 to 40 lbs. that either have or are making good yearly records. (Several of those dams have over 30 lbs. and will finish the year well above 1,000 lbs.)

Better write today for that sale catalog.

MAXWELL FARMS - - - - WATERLOO, IOWA

365-Day Milk Production

STILL ANOTHER ONE

Grandson of Sir Pietertje Ormsby Mercedes 44th out of a granddaughter of Lord Homestead Netherland De Kol, born Jan. 4, 1920.

Handsome calf beautifully colored, more white than black, well grown out, perfect top line; in fact, a fine individual of the popular breeding. This bull will get you "all the year round" producers. Our price is within reach of the farmer or small breeder.

CERRO GORDO FARMS, - Mason City, Iowa.

YOUNG BULLS

Backed By Real Production

We are offering for sale sons of our Sir Pietertje Geneseo Alcartra whose dam, Miss Pietertje Alexina 2d, has a 42.42-lb. 7-day record and a yearly record of 1,290.94 lbs. butter from 24,219.1 lbs. milk. These youngsters are good individuals from heavy producing dams. They are priced to sell.

Facts in BLACK & WHITE

You Should Become a Member

The Holstein-Friesian Association of America, the organized breeders of the popular and prosperous Holstein cattle, was founded in 1885. Today it has nearly 15,000 members, registers over 80,000 Holstein-Friesian cattle each year, giving employment to 150 clerks, and has over a quarter of a million dollars as a Reserve Fund. It spends nearly $50,000 in Holstein publicity and Extension work, and a member directly and indirectly reaps the benefits of the progressive work of this truly great organization.

If interested in Holstein cattle write today for our free booklets.

FOR SALE AND EXCHANGE

25 head of Holstein cows, 23 of which are high grade and 2 are registered. Also herd bull, a grandson of K. S. P. A., the fifty thousand dollar bull. This bull is from a 27-lb. cow. Most of these cows bred to this bull. All young cows and well marked, good heavy producers. Price $200 per head if the herd is bought together. Will take two good teams of draft mares or mules as a partial payment. Might consider a good automobile as a partial payment.
G. A. HIGGINBOTHAM, ROSSVILLE, KANSAS.

Head Your Herd With a Bull!

Get a son of King Superba out of one of our good cows. King Superba's offspring won first and second in get-of-sire and calf herd at the Wisconsin State Fair, 1918. His four daughters sold in the Waukesha Sale, Nov. 1919, averaged $959. King Superba's dam was the first cow to be strictly officially tested for the entire year. She produced 1231 lbs. butter, 26,433 lbs. milk as a four-year-old. She has twice produced over 33 lbs. butter in 7 days. If you wish to combine individuality and production, head your herd with a Son of King Superba. We now offer a number of his choice sons, serviceable age and younger, out of dams with records up to 24 lbs. Several of the dams are on yearly test. Don't wait. Come and see them now. **BAIRD BROTHERS, WAUKESHA, WISCONSIN.**

One of the sons of King Superba. They are all excellent individuals.

A SON OF THIS GREAT SIRE

AT THE HEAD OF YOUR HERD WILL MEAN DOLLARS IN YOUR POCKET

MATADOR SEGIS WALKER, Jr. 6-year-old

DON'T OVERLOOK THIS YOUNGSTER

E. T. 1061. MATADOR SEGIS WALKER HARTOG. Born 4-27-19. This young bull is 90% white. His sire is MATADOR SEGIS WALKER, who at the present time has 29 tested daughters, and still a Junior 6-year-old bull. We have over 125 of his daughters in our herd and about 50 will freshen during the year, from which we expect great results. 28 of his daughters in two-year-old form average 20.08 lbs. butter from 405.59 lbs. milk. 3 of his daughters in three-year-old form average 30.03 lbs. butter from 531 lbs. milk. His first three 2-year-old daughters to finish yearly work averaged 798.68 lbs. butter from 20,761.5 lbs. milk. We predict MATADOR to be one of the youngest century sires of the breed.

His dam, HAZELWOOD AAGGIE HARTOG, has a very creditable record of 24.94 lbs. butter in 7 days. She will freshen again in May and is a very good prospect. We will run her for a year. She is a very good show animal, very large and weighs 750 lbs. In fact, she is one of the good foundation cows in our herd. She is beautifully marked, just as straight as a string, the real dairy type, and her son is a chip of the old block. Don't overlook this bull, for he is going to make some one a great future herd sire.

Price on him for immediate sale $750.00

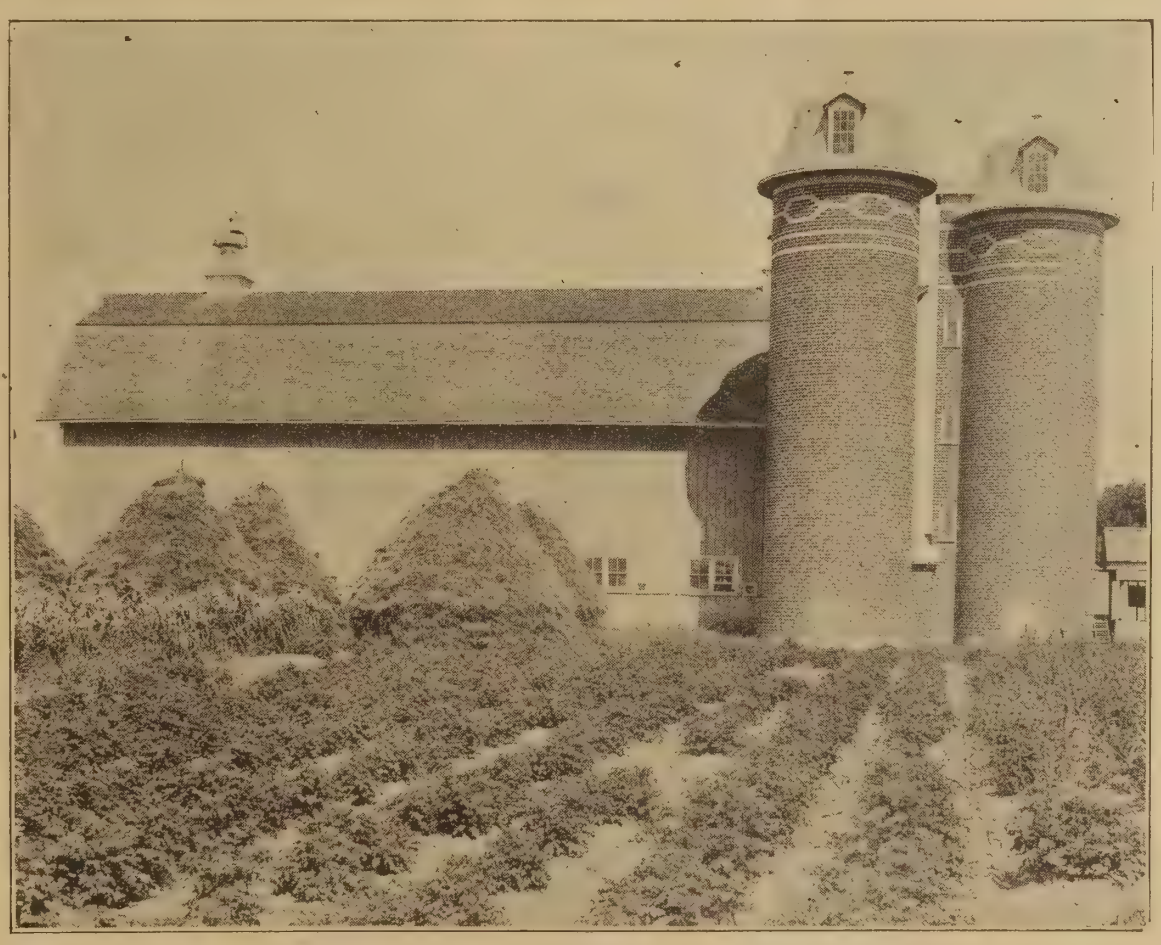
HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LX FORT ATKINSON, WIS., AUGUST 27, 1920. Number 6

NEIGHBORS COSTLY INSTITUTIONS



HELEN S. K. WILLCOX, New York

NEIGHBORS are pretty important folks in your and my scheme of things, especially if we live in the country. The neighbor joke is as old as the hills, on the order of unloved mothers-in-law and newlyweds and the first baby. Story writers have dwelt long and energetically on the unfortunate apartment dwellers who are invariably supposed to be cursed with the borrowing neighbor, the latter taking due advantage of his unavoidable proximity to use the other's telephone night and day, to seek the loan of unnumbered postage stamps, and to casually demand anything in the grocery line which happens to be lacking on his own pantry shelves. Oh, yes, neighbors are well and familiarly known through out the world and their commissions and omissions would fill a veritable giant of a book. But the fact that we mainly pass over in cussing and discussing our neighbors is that we are neighbors ourselves and while we are engaged in gossiping about the beam in the next-door man's eye, he may, at the same instant, be employed in a heartfelt prayer to be delivered from any more neighbors of o own personal persu sion. For just such state of affairs generally exists in every hamlet, town, and city anywhere.

Someone has said that your neighbor is the man whose good opinion you crave. This ought to be true if it isn't always. But at least we can all agree that life would be a pretty strange, prosaic affair if it weren't for those neighbors we call friends and fellow citizens.

The man in the back woods whose farm is one of the few and far between in his vicinity generally has started something when he decides to buy a Ford or a Buick in order to get to town and city market and amusements more quickly. His neighbors begin by speculating darkly on his ultimate arrival in the poor house, then nine times out of ten end by purchasing duplicates in the motorized vehicle—and each and all live much more happily for ever after.

Or a certain farmer, better read, and a bit keener, perhaps, than the grand average, decides that the time has come to junk his scrub dairy and invest in something more profitable. That man is the one his community should value as more precious than oil wells or wild cat mines—for the neighbor who persuades first himself and then his co-workers that pure-bred stock pays, and that maybe cow testing associations and balanced rations and up-to-date barns and so on are strictly necessary in this day and age—well, I leave it to you. Such neighbors are worth watching closely in case they try to put something over on us that all the rest can't follow, and so cheat us from becoming likewise more respected and forward-looking and prosperous ourselves.

JUST BEFORE SILO FILLING TIME ON THE E. H. TURNER, FARM, WISCONSIN

Yes, such will bear close and careful consideration where their next progressive move is concerned.

It's a pretty big thing, this of being a neighbor, and it's a wonderful fact that here in America we choose about every time to be good neighobrs instead of bad ones. The late unpleasantness known as the World War was caused by the butting-in and nosiness of neighbors who, if they had only known it, might ten million times have better been forever engaged in minding their own prosperous businesses instead of seeking to start something which concerned them not at all. We know today that England and France and Belgium and Italy and the United States—of course there were others—were peaceable, friendly, live-and-let-live neighbor nations, while it is unnecessary to mention their trouble-borrowing cousins who bit off more of the adjacent nations' affairs than they could chew—and have been conducting post mortems about the unhappy but very natural results ever since.

Yet there are many folks left who remind one disagreeably of the big nations who were kicked down and out by their more public-spirited neighbors. For instance, there is the farmer who seemingly has everything to make him contented and happy and popular, but who bears a reputation in his locality verging on the mean, small, and selfish. He probably owns several good farms and at least half a dozen mortgages on as many others and is recognized as a power for wealth and influence locally. Yet he is known first of all, in spite of his financial standing in the neighborhood, as a brutal, domineering husband to his patient, toil-worn wife; as a driver and tight-wad to his children who leave the family acres before they are barely knee-high; and as a foreclosser of widows' mortgages—a man who in truth can make the eagle on long-suffering currency squak in his grip, but who yearns even in his sleep to grab the possessions of others and add to his already swollen stores. It is not difficult to recall that a great nation was similarly afflicted with the lust of earthly accumulations and ended, even as this occasional poor neighbor of ours will end, friendless and alone, held in contempt and hatred among those with whom it and he might have cut such an inspiring and worth-while figure.

But such neighbors rarely infest our countryside today, we are glad to state, and in their places we are encouraging by envying and emulation those neighbors who sometimes go to the other extreme and thereby set almost as pernicious examples as the villian tight-wad and unscrupulous one. You know this kind also and probably know him far better—in

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Guernsey Products Won at National Milk and Cream Shows

A total of 87 gold and silver medals have been offered at the Milk and Cream Show, held annually since 1906 in connection with the National Dairy Show. Seventy-one of the winners have informed us regarding the breed of cattle that produced the products exhibited. The 71 reports show that Guernsey milk and cream have won 17 gold medals and 14 silver medals. Milk and cream from two or more breeds, including Guernseys, won four additional gold medals and eight additional silver medals. In other words, Guernsey products, in pure form or in mixed form have won more than 60 per cent of all gold and silver medals reported.

AMERICAN GUERNSEY CATTLE CLUB.

Hairy Vetch

Hairy vetch seed is perhaps not used as much at present as it was some time ago, but this is due primarily to the small importations from abroad and the consequent increase in the price of seed.

The American supply of seed for market purposes is grown almost entirely in the state of Michigan. It is still, however, one of the best cover crops and green manure crops to be found along the South Atlantic border, being more hardy than crimson clover. The use of this crop could be very much extended if farmers would save their own seed, which is not at all difficult to do but requires some trouble. Every farmer could easily devote a half acre to seed production which should supply as much seed as the ordinary farmer would need to use.—C. V. PIPER and A. J. PIETERS, U. S. Dept. of Agriculture.

THE DAIRY OPTIMIST

W. LIVINGSTON LARNED

Absolute Contentment

I've never longed to leave the farm
And scoot to some high-powered place.
Toil puts the muscle in my arm,
Town puts the worry in your face.
Go to your desk, your crowded cars,
Your constant hustle, bustle stuff.
My desk is underneath the stars;
I eat and sleep—and work—enough.

I've never longed to leave the farm,
Because it's peaceful here, and fine.
Pure air, and freedom from alarm,
The riches of the earth are mine,
At dawn I'm up and with the herd;
Then down the lane, and out with them
To meadow, clover, stream, and bird,
The young sun, like a giant gem.

I've never longed to leave this place
Of growing crops and earnest toil.
The soft rains wash my eager face,
My heart is rooted in the soil.
But you must have love in your heart
For simple things and simple ways,
To share with God, a little part
Of things near Him through holy days.

The Dairyman's Philosophy

Poets say that living on a farm means living a little nearer Heaven. That's not poetry—it's just plain truth. You can't sit in Nature's lap without looking up into God's face once in a while.

Never fear about America going into the doldrums. All life is a balance, and there are enough folks out on the farms of the country who love work and home well enough, to balance the discontented chaps in town.

When you speak of the riches of a community—gold and silver and precious stones and bank balances and international credits, do not forget that milk comes in for mention. It means health, and health means wealth.

A Prohibition Argument

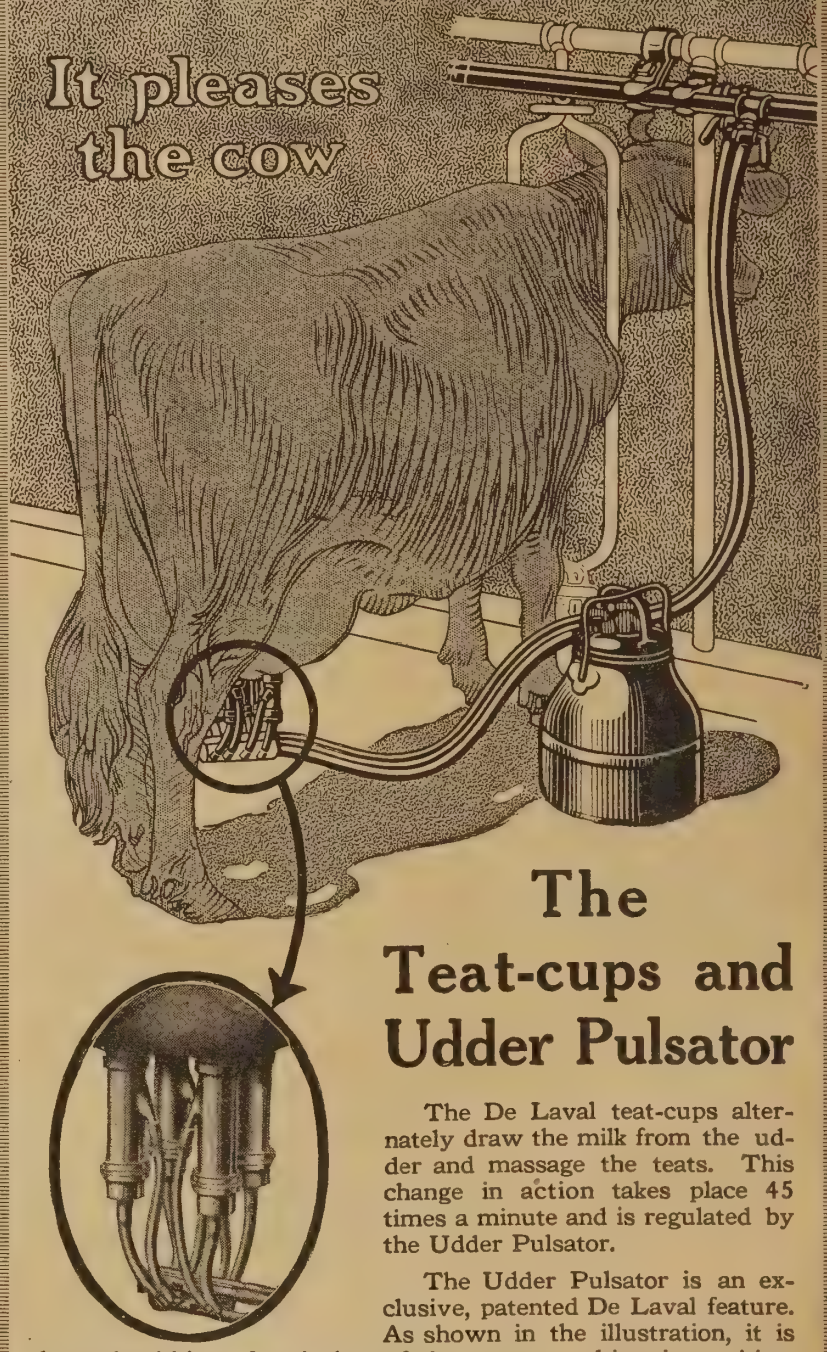
Dairy farmer, John King, who lives near Durham, North Carolina, was treated to a surprise not long since. He discovered his cows acting mighty strangely in a meadow. They were unsteady on their pins, hilarious, sleepy in spots. A veterinarian was called in and he made an examination.

"Those cows are intoxicated," said he.

"What!" exclaimed the dairyman. "Impossible."

"I know I'm right," said the vet.

They started looking around and guess what they discovered. In a secluded part of the pasture, but on another piece of property, a moonshine still. The cows had eaten a quantity of the mash that had somehow gotten into the little stream.



And, as the vet remarked, what fine milk punch they must have gotten at milkin' time that evening.

The Country Mother

Her snow white hair.
The kindly touch of her loving hands.
Her keen interest in her children.
The way she loves the homestead.
Her ability to cure everybody's ills.
The pies she bakes.
And the perfectly wonderful bread.
Her ability to keep smiling.
The tidiness of her home.
How the farm hands respect her.
That butter she churns.
And the cheese she makes.
Her treasure-trove of a cellar.
Sacrifices she makes for the young folks.
The vision of her in her rose garden.

The De Laval Milker

It pleases the cow

The Teat-cups and Udder Pulsator

The De Laval teat-cups alternately draw the milk from the udder and massage the teats. This change in action takes place 45 times a minute and is regulated by the Udder Pulsator.

The Udder Pulsator is an exclusive, patented De Laval feature. As shown in the illustration, it is located within a few inches of the teats, resulting in positive, snappy action of the teat-cups. Every cow is milked in the same way every day and the result of this gentle, regular action is maximum production.

There is only one moving part in the Udder Pulsator—a plain piston—requiring no oiling, adjusting or repairing.

The De Laval teat-cups and Udder Pulsator are a distinct step in advance in milker construction, and the success of the De Laval Milker depends to a very great extent upon their functions.

The De Laval Milker possesses many other new and exclusive features that are of inestimable value to the careful dairyman and owner of valuable cows. Its action is positive and uniform from day to day, and it is faster, more reliable and more sanitary than any other method of milking.

Wherever cows are milked the world over, the name "De Laval" stands for quality and highest value to the user. The fact that it bears the name "De Laval" is a guarantee that it will give the service claimed for it.

Write to nearest De Laval office for Milker Catalog, mentioning number of cows milked

AN OLD-TIME JERSEY BREEDER

A Vermonter Who Has Stuck to One Family of Jerseys Since the Eighties

J. C. GREENE

IT is a great thing to develop a champion producer—to so feed and care for a cow that she excels the records of all others in her class. More than common skill is needed for that achievement. To keep an animal at her best for a full year and bring her through a record breaker is an honor worth seeking. "'Tis a consummation devoutly to be wished."

But an even greater accomplishment is to breed such an animal—to bring about a blending of blood lines from which shall come an animal capable of leading a breed in the production of milk and fat. Quite as great honor is due the breeder who intelligently directs out-crosses which lead to improvement or consistently intensifies a single line of breeding to the end that heavier producing qualities result, as to the feeder and tester who develops an animal and by that development measures the degree of success attained by the breeder. One perfects a machine, the other demonstrates its efficiency. One is an inventor of a great machine, the other an expert operator.

Many champion cows have made their records for the men who bred them. A number have not, however, and when they have finished their work and are heralded as champions, the names of the breeders responsible for the cows themselves go unsung. One of these is the Jersey cow, Successful Queen, which was a gold medal junior four-year-old with a production of 16,389,-.3 lbs. milk, 852.72 lbs. fat. She has four AA records totalling 59,907 lbs. milk, 3,071.32 lbs. fat; averaging 14,-976.5 lbs. milk, 767.83 lbs. fat. It seems worth while to know something of the breeder of such a cow, for neither her developer nor her present owner bred her.

J. C. Greene bred Successful Queen. He lives on a small Vermont farm, several miles over the hills from a railway station, and has bred Jerseys there since the early eighties. He selected the Jersey breed because of their production in his neighborhood more than a third of a century ago. Two cows were purchased at the beginning for $100 and two others were kept fifteen months to pay for a third female, a calf. No cows have been purchased since that time, new blood being brought in only through the use of sires not closely related. Mr. Greene is an old timer in Jerseydom. His own experience goes back to years the present generation of breeders never knew and to animals which served as the foundation of many present day families of prominence. He is no newcomer, and yet as he tells of the early Jerseys his listener must marvel that the modern dairy industry has been builded from so small a beginning in a single lifetime.

The sire of Mr. Greene's first two cows was Scituate Albert, a grandson of Duke of Darlington who was out of Eurotas, credited with a production of 778 lbs. 1 oz. of butter and who is inbred strongly enough to trace to Saturn, Register number 94, and Rhea, Register number 166, six out of a possible eight times in the fourth generation of his pedigree. This first sire was also a grandson of Couch's Lily, credited with 71 lbs. of butter in 31 days, a great granddaughter of Splendid, the second bull registered by the American Jersey Cattle Club. Scituate Albert was out of Scituate Princess, a granddaughter of Jersey Belle of Scituate whose butter test for a year was 705 lbs.

Another bull whose blood was used in the herd which was to produce Successful Queen was a son of King Riomentor and the sire of the dam of Successful Queen. The sire of the champion was the next to the last bull used on the Greene herd, Torono 2nd of Hood Farm's Son, a double grandson of Torono. The last bull used was a son of Pogis 99th.

Mr. Greene believes that in developing a herd from a few cows and using intensely line and inbred sires of one line of breeding, all the animals produced are much alike in their production capabilities. He believes Successful Queen to be the logical outcome of the kind of breeding followed. He believes, too, that the present day Jersey does not greatly excel the type of cow with which he started more than thirty years ago. When recent Register of Merit records are quoted to show the increased capacity of the cow, he cites such productions as the 1885-6 record of Landseer's Fancy of 936 lbs. 14¾ oz. of butter, that of Eurotas of 851 lbs. in 1879-80, and the production of 705 lbs. by Jersey Belle of Scituate in 1877-8. He holds that the present large records are possible because of more knowledge of record making rather than because of the improvement in the cow herself. He says Successful Queen with her world record is no better than her sisters which are similarly bred and which average about 325 lbs. fat per year.

MR. GREENE STARTED WITH SUCH COWS AS THIS MORE THAN A THIRD OF A CENTURY AGO

She bred until eighteen years of age and produced profitably. Among her descendants is Successful Queen, a world record cow.

THE GREEN FARM IN VERMONT—THE SECOND SETTLED IN THE TOWNSHIP, SO EARLY THAT ITS FIRST BUILDINGS WERE BURNED BY THE INDIANS IN 1870. JERSEYS HAVE BEEN BRED IN ITS STABLES SINCE THE EARLY EIGHTIES

SUCCESSFUL QUEEN, WHOSE CHAMPION FOUR-YEAR-OLD RECORD IS 16,389.3 LBS. MILK, 852.72 LBS. FAT. HER FOUR A. R. RECORDS AVERAGE 14,976.5 LBS. MILK. 767.83 LBS. FAT

Mr. Greene is optimistic over the opportunities for the beginning breeder. In his opinion it is much easier to be successful now than when he began with pure-breds. Perhaps he has not taken advantage of the opportunities offered him in the development of his cows, but he has consistently adhered to a breeding plan which has given results. He well deserves the honor which should go to him whose efforts produce better animals. He has bred a world champion.

National Jersey Sale

In conjunction with the State Fair of Louisiana at Shreveport, October 28 to November 7, there will be held this year the first annual National Jersey Cattle Show, fostered by the American American Jersey Cattle Club. Many of the leading Jersey herds of the United States and Canada are expected to be represented in the show, and if plans are carried out there will be operated a special train for the accommodation of owners and their cattle from Chicago at the close of the National Dairy Show.

Premiums to be awarded at the Jersey Show total $6,000, which is said to be the largest amount of premium money ever offered on dairy cattle exhibits.

The show will be held in the State Fair Coliseum, which in previous years has been devoted to vaudeville and similar attractions. In compliment to the exhibitors from other sections, the Louisiana exhibitors will not try to place their cattle in the Coliseum, but will show under tents to be pitched for their accomodation.

An auction sale is scheduled as a feature connected with the Jersey Show, and, in view of the great interest taken in dairying in this part of the country, the bidding is expected to be very lively.

Adyices from Washington indicate that a government dairy exhibit may be sent here in connection with the big Jersey Show.

Premium money has been increased in all live stock departments, and record-breaking exhibits are expected at the Louisiana Fair.

Louisiana. D. G. FRANTZ.

A Real Job for Agricultural Graduates

PAUL T. MENZEL, MARYLAND

IN agriculture there has been a co-operation between farmers and the graduates of the agricultural colleges that has not been found in any other industry. The ideal of the graduate of the agricultural college is not only to make a success of his own future, but to be a servant of the state and community and pass on the benefits of his education to those who have not been quite so fortunate as he has been. He has gone out into the world with full realization that he still has much to learn and that he must be cautious not to go beyond his experience. It has been this spirit of modesty and willingness to recognize his own limitations that has engendered the close feeling of co-operation between the farmer and the college graduate. As a result, agricultural extension work has taken deep root, and its work has brought about immeasurable advancement and benefits.

The greatest need today of improvement along any phase of agriculture is in milk production. Scrub cattle must give way to pure-breds or high grades, and inefficient methods of feeding must be supplanted by more effective ones, the unprofitable cow must be detected by reliable records, the farmer must be taught how to feed his cattle with rations that give more milk at less cost and he must be educated to the advantages of better stock and the realization that the *pure-bred bull* is the *salvation* of the future of the dairy industry. This change and reformation will not come about in a day, nor even in a few years, but unquestionably it will largely be brought about under the leadership of college trained men, mostly in the capacity of supervisors of cow testing associations.

A WISCONSIN TESTER AT WORK

During the war, women took up cow testing and proved equal to the job. Several of them have continued in the work, yet there are many associations still waiting for a competent tester. Wages are good and the opportunities for service and education are excellent for both men and women graduates of agricultural schools.

Profits That are Secure

Cow testing associations will be more important in reducing the cost of milk production and increasing profits than any reduction in the cost of feed, labor, marketing, and incidentals, one or all. Any changes in any or all of these items are automatically met by corresponding changes in the price of milk, whereas improvement in milk production by either more milk per animal or by smaller feed cost is largely clear profit regardless of the costs of the necessary expenses. For example, no matter what relationship there may be between the cost of milk production and the selling price, there will always be greater profit from a herd that averages 6,000 pounds of milk per animal for a year than from a herd with a 5,000 pound average. It has been well established that the heavier producers do not eat much more feed than poor producers and that the increase in the feed cost is only a small fraction of the increase in profit. Likewise, if a man can get a certain quantity of milk by correct methods of feeding at a lower cost than would be the case by using ineffective methods, the gain is virtually clear profit.

The universal experience and observation of those acquainted with the actual results obtained through testing associations has been that almost every member has been enabled to derive some advantage from the association which has enabled him to obtain greater profit immediately by improved methods of feeding or has in time improved his herd to such an extent that far greater profits were realized than formerly.

The Dollars That Should Be Saved

In the state of Maryland the average production per animal is less than 3,900 pounds a year, whereas if the average was 5,000 pounds of milk, the milk producers of the state could put about $7,000,000 more profit into their pockets. Pennsylvania's million cows average a little above 4,000 pounds, and an improvement of 1,000 pounds for each animal (which could easily be done by a pure-bred bull in one generation) would bring an increased profit of at least $30,000,000. Similarly, there are many other states in which corresponding improvement could be made. Throughout the country it is evident that several hundred million dollars could be added to dairy profits by improvements along the lines suggested.

These improvements will largely be brought about by cow testing associations. Some folks may think that the farmer will gradually bring about this betterment of his own accord. However, he is very reluctant to take on the extra work and will usually leave it undone if he cannot get someone else to do it. For example, the farmers of a certain community were given the opportunity to have their herds tested and the records kept if they would weigh the milk from each cow and bring in a sample for the Babcock test. Despite good publicity given the offer and personal interviews of the teacher of agriculture with a number of the herd owners, not one man went so far as to bring his samples. All of those interviewed expressed an interest on the formation of a testing association and indicated that they would rather pay to have the work done for them than to be bothered with even half an hour a month to take a few samples and record the weights of the milk from each animal for two milkings.

The Association Without a Tester

From this experience of the writer it is evident that the farmer is willing to be a party to anything that will bring better dairying if he can hire someone else to do the work that he is not ordinarily used to doing. It is for this reason that there is such a tremendous demand for trained men to act as supervisors of testing associations. The farmers are willing to be led, and in most cases actually thrust upon the tester opportunities for bringing about better methods of feeding, better management, and herd breeding. A cow tester has unparalleled opportunities for extension work, not only along dairy lines but also in any phase of farming. There is hardly a farmer who is not virtually hungry for information as to how he can better his crops or stock, and he looks upon each visit of the tester as a splendid chance to learn all he can.

In a measure the tester is more effective than the county agent, because he goes into the farmer's home and in most cases is treated as one of the family. After supper the conversation runs into all the problems of the farmer, from cows to potatoes, and even a word from the farmer's wife about the chickens. In my own experience as a cow tester I well remember some of the farmers who asked me to arrange my work so that I could be with them over Sunday, in order that they would have more time to talk over things. The cow tester is a great factor in bringing to the farmer the practical gist of what he has learned in college and is a heretofore unrealized yet powerful factor in educating the farmer in better methods of agriculture. The tester is virtually a private tutor to the farmer and, by going into the farmer's home, is able to help him solve his problems according to individual needs and to a degree that cannot be done even by the county agent.

A COW TESTING PICNIC

The social as well as the educational side of our nature is developed by these get-together organizations.

Valuable Experience as a Tester

In view of these facts cow testing offers the college graduate an unexcelled opportunity to do altruistic extension work that will bring about immeasurable good, and at the same time gives him an experience that is broad and diverse and that far excels any experience that he could get in any other way. We know that broad experience obtained under diverse circumstances is necessary to cope with large and unexpected problems. Many years of hard knocks and expensive mistakes are sometimes necessary to obtain such experience.

The twenty-six or more members of an association comprise men who usually are above the average and who represent all phases of agriculture. One may be primarily an orchard man, another may be a trucker, some may be general farmers, each of whom has some specialty about which the tester can learn something worth while. Such a diversity offers a wide opportunity for observation and first hand experience. By taking the best pointers from each member, the tester can piece together a wealth of knowledge and information that cannot be obtained in any other way. A year of cow testing will be of more benefit than any one other thing that can be done, and from it one cannot help but gain a maturity and feeling of security in definite knowledge, in good management, and solutions of difficult problems that are only obtained after many years under ordinary circumstances.

Aside from its practical value, cow testing has untold value as a means of social education. By actually liv-

ADVERTISING WHAT A COW CAN DO

A HAY LOADER IS INDISPENSABLE AS A LABOR SAVING DEVICE ON THE AVERAGE FARM

STACK COVERS COST A BIT BUT THE PROTECTION TO CROPS THEY OFFER PAYS BIG DIVIDENDS

BETTER HAY BY THE SIMPLEST WAY

C. A. LE CLAIR, WISCONSIN

ALTHOUGH not the best of feeds, timothy is the most widely grown hay crop in America. There are a number of reasons why farmers stick to timothy. In the first place, the seed is cheap. Furthermore, it is a hardy crop which seldom fails to catch. Again, it is a staple food for horses. In the feeding of city work horses, it has been termed fool proof, because even the most inexperienced of teamsters cannot feed it to excess.

Farmers who have begun to find difficulty in getting stands of clover and alfalfa find timothy ha/ a stand-by with which to round out their rotations and which assures a crop without demanding much labor. Professor L. F. Graber, the alfalfa expert, in his most recent publication on how to get a crop of alfalfa, recommends sowing it with timothy. He says:

"When a mixture of one-fourth timothy and three-fourths alfalfa is sown, the combination insures a more uniform stand of hay and the timothy helps to keep out the blue grass and weeds when winter-killing occurs."

Time to Cut Timothy

One of the things which very greatly influences the quality of hay is the time it is cut. An extensive grower of timothy hay in Massachusetts in speaking of this matter said: "A farmer who year in and year out waits until after the Fourth of July before he begins to make hay, generally gets no more than one respectable crop in five. To my way of thinking hay making, like the Einstein theory, is based on relativity. In other words, it is related to the degree of maturity of the crop. I plan to cut my timothy any time after the heads blossom and before the seed is ripe. This makes hay of excellent quality."

Tests at the Missouri Agricultural Experiment Station where animals were allowed to be the judges of the quality of hay cut at different times bear out the truth of this man's opinion. A part of a field of timothy, in the experiment referred to, was cut on the 12th of June when the grass was in full head. A second strip was cut in the same field on June 20th when the crop was in bloom. Another block was cut July 1st when the seed had formed; the fourth, about July 8th, when the seed was in the dough. Finally, a fifth lot was cut when the seed was ripe.

To determine which kind of hay the animals preferred, steers, milch cows, and sheep were given access to racks having some of each. Sheep showed little preference but steers and cows relished the early and medium early cut hay. The investigations brought out, however, that the earliest cut hay was more difficult to cure, yielded somewhat less to the acre, and tended to weaken the succeeding stand. From the standpoint of favorable weather for curing, yield, and subsequent life of the grass, medium late cutting of timothy seems to be most profitable. I have found that men who have had considerable experience in making hay on an extensive scale always begin mowing when the grass is a bit too green to make good hay. Under this plan, if rains put haying late, they stand a better chance to get the bulk of the crop cut before it gets too ripe.

Next to the harvest of grain crops, haying is the biggest job on the average farm. It is at best a hustling job and requires considerable head work. In advance of the harvest the mowers and other equipment should be tuned up to the minute so that there will be no delays when the rush begins. The use of seven foot mowers and side delivery rakes capable of handling two swaths at once facilitates much economy of time. In fair weather grass cut in the afternoon of one day can be kicked about with the tedder before noon of the next and if nothing hinders it can be raked into windrows before night. At times when things move fast it is the wise man who is prepared with an extra sickle and other parts for the haying equipment which may be put in place without deday in case of break-downs. A trip to town, even with an auto, for such necessaries means for most men at least a quarter of a day lost time for himself and perhaps a crew as well. If the local dealer happens to be out of stock, complications are even worse.

Most of what has been said regarding the making of timothy and mixed hay applies equally well to the curing of the far more nutritious but less extensively grown clover. In all cases where first cuttings of either grass or clover are made, the sickle of the mower should be raised so that enough stubble is left to protect the bulbs or crowns of the plants.

Unloading Hay

Fully one-half of the 80,000,000 tons of hay produced each year in this country is stored in out of door stacks. Probably not more than one-fourth of the men who put up hay in this way are properly equipped for the work.

When hay is pitched from cocks or windrows on to a rack and then lifted again in the making of the field stacks, a great deal of labor is needlessly wasted. It is to lighten the burden of such work that the hay loader has in so many cases been put to use where hay making without a "bucker" rake and stacker is practiced. There is certainly an advantage in the use of a loader under such conditions. However, there is need for a more general application of devices for making the unloading of hay as easy as the loading.

To this end the hay fork is admirably adapted. While it has long been used in the loft storage, the fork is too seldom employed in field stacking. A farmer of Ramsey County, Minnesota, has devised a scheme of stacking which undoubtedly merits the attention of men who are not owners of complete haying equipment. This man dug the necessary holes and placed telephone poles at suitable intervals on the stacking ground. After anchoring an end of a one-inch steel cable in the ground he securely fastened the line to the tops of the poles. It was then stretched tightly and the free end made fast at another ground anchorage in line with the poles. A hay fork made to operate from a swivel pulley attached to the cable permits the making of stacks between the poles. With this device a load of hay can be stacked in less time than it takes to tell about it. If care is taken not to load the fork too heavily, the men on the stack can do as good a job of stacking as when hay is pitched to them by hand.

It takes very little time to set the poles, string the cable, and attach the fork. Most farmers need not make any special investment in order to erect this handy device. The wood lot in many instances will furnish the poles. The fork from the barn loft can be temporarily used for the field stacking. A piece of hemp rope although not as good as a steel cable lends itself as a support of the fork. Thus, for little or no cost it is possible to make a hay stacking outfit capable of turning a laborious job into comparatively easy work. This is a time when any device that will eliminate labor on the farm counts. Why not try out this scheme?

AT LEAST A QUARTER OF THE HAY IN THIS POORLY BUILT STACK WAS RUINED THROUGH EXPOSURE TO THE WEATHER

Far too much well cured hay is ruined by improper storage. One sees everywhere low, flat hay stacks which have one-fourth or more of their contents exposed to the weather. With even coarse marsh hay or wild hay worth in some places as much as thirty dollars a ton, the chances to spoil the profits in hay by needless exposure to weather are apparent. Adjustable stack covers, though somewhat costly to erect, soon pay for themselves in the protection they afford. They have a particular value in cases where it is necessary to open a stack and remove hay at intervals.

THREE POLES, A CABLE, AND A HAY FORK MAKE UP THIS SERVICEABLE STACKING DEVICE

We are not so much concerned as some seem to be about the freezing of silage in the silo. Freezing may be inconvenient but it in no way affects the quality or palatability of the silage. If the frozen silage is raked off the walls and thrown to the center of the silo in a pile it is usually thawed out by the time of the next feeding. The only precautions necessary are to see that the silage is well thawed out and then is fed at once. Frozen silage spoils quickly after being thawed out.

Uncle Sam's Hired Men Who Serve You

An Organizer of a Nation-wide System of Education and Research in Agriculture and Home Economics Is Dr. A. C. True, Director of the States Relations Service

This is the third of a series of articles prepared by the U. S. Department of Agriculture, and which we are publishing at the request of Secretary Meridith to acquaint our readers with the type of men who are making possible the wonderful service the department is rendering and stands ready to render our readers that those not now availing themselves of these services may do so.—EDITORS.

CAPTAIN H. P. SHELDON

"A GREAT winner of battles." That was the description I had of the man; and the search for him took me to the top story of a gray office building in Washington. I wanted to see this warrior, this man who fought the battles of the farm boy and farm girl, the farm woman, and the farmer himself. Quite naturally, I expected to find a typical fighter, a man lean of frame and strong of jaw; a man of steady eye and brief, curt address. But when a door opened and I stepped into the office of Dr. A. C. True, Director of the States Relations Service, United States Department of Agriculture, I met a man who had none of these marks which denote the warrior—excepting, perhaps, the eyes, which were steady and direct in their gaze. The man looked more like a scholar than a fighter; yet I had another's word for it that he was a winner of battles.

But was that all that my informant had said on the subject? Wasn't there another phrase? Oh, yes! "He wins his battles without fighting them!" That was the rest of the sentence; the qualifying statement that helped me to reconcile this scholarly appearing man with his reputation of accomplishment. "Winning battles without fighting them!" Strategy instead of force of arms. Didn't a great general say that more battles are won by marching than fighting? Haven't history's greatest soldiers been scholarly men? I began to understand.

Dr. True is not a fighter in the sense of plunging against obstacles; rather he is a diplomat and wins his point by clearing away the trouble-making barriers. He has great faith in common counsel, mutual understanding, and broad-minded co-operation. In the days when Dr. True was beginning the task that was to be his life work he was often met by strong, sincere opposition from men or from organizations. When this occurred, did he rave and rant and argue and antagonize? Indeed he did not! He gave his opponent credit for a sincerity equaling his own, and then set about to find why their "minds did not meet", as the lawyers would put it. Nine times out of ten he found the obstacle, nine times out of ten it was only the confusion of two minds striving for the same worthy goal, but approaching along different paths, and nine times out of ten he succeeded in clearing the misunderstanding away and enlisting the support of his one-time opponent in the great cause for which he worked—the elevation of agriculture to its true rank as a profession, and the enlisting of effective co-operation of all worthy forces to this end.

Dr. True was educated at Wesleyan University, graduating from that institution in 1873. He attended Harvard University from 1882 to 1884. His education was classical and scientific, though it proved to be admirably adapted for the service he was to perform. His interest in agriculture came later, when the establishment of agricultural experiment stations and the development of the land-grant colleges opened the door to professional training in agriculture. Dr. True's work, after he left college, was that of teaching, but he was soon called to Washington to organize and edit the Experiment Station Record, which is now recognized as the most complete review of scientific investigation in agriculture in the world. This was in 1889, and from that time on Dr. True's effort was directed toward organizing and establishing agricultural research on a sound scientific basis, putting agricultural subjects in pedagogical form—shaping the science of agriculture so that it could be more effectively taught in American colleges and schools—and making agriculture a recognized, honored, and useful profession.

"Judge a carpenter by his chips" is a homely way of stating the great truth that a man must be judged by the work he has done. Dr. True has heaped his bench with the right sort of chips. His tool has been the Office of Experiment Stations and its enlarged successor, the States Relations Service of the Department of Agriculture, and here are some of the finished products turned out by this bureau under his direction.

It has helped greatly to bring about the present system of agricultural experiment stations, which is "unsurpassed in the world for its efficiency and practical usefulness to agriculture."

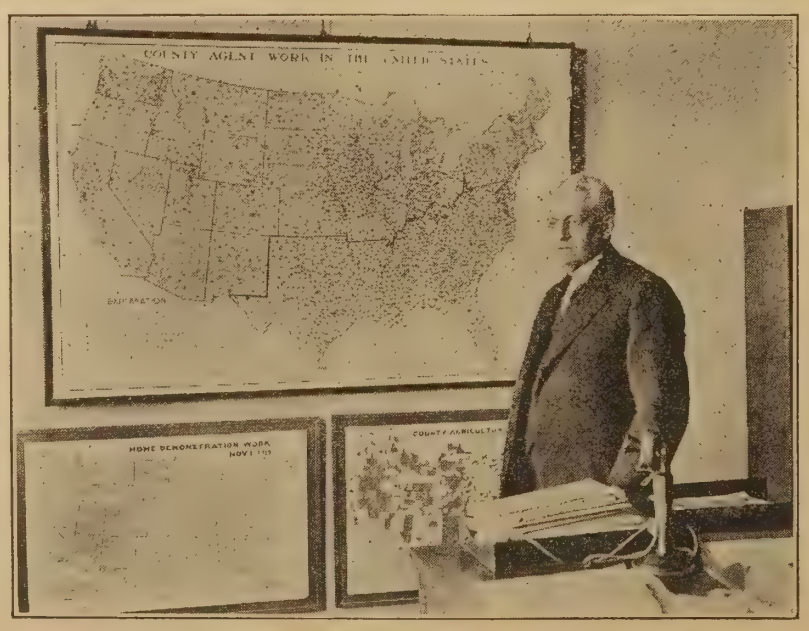
It has been influential in putting the subject matter of agriculture and home economics in teachable form for the use of agricultural colleges and lower schools.

It has helped the masses of farm people, who could not go to college, through the educational extension work in agriculture and home economics carried out by the county agricultural agents, home demonstration agents, club leaders, specialists, farm bureaus, and publications.

A widespread revival of the production and conservation, by canning and other means, of fruits and vegetables for home consumption is a notable achievement of the extension workers of the service.

Alaska owes its agricultural awakening to the service, and hardy cereals and vegetables are now grown within a comparatively short distance of the Artic Circle.

The agriculture of our insular possessions—Hawaii, Porto Rico, Guam, and the Virgin Islands—is also being developed and made more nearly self-sustaining by the work of the service.



It has made important contributions to the scientific and practical knowledge of the economical and efficient use of the products of agriculture and to the subject of home economics in general through its investigations relating to foods, diet, clothing, and household equipment, work, and management.

To the inquiring person, Dr. True will probably emphasize especially the contribution of the States Relations Service toward making the science of agriculture an accepted course in American educational institutions, but you will find many men high up in farming affairs who hold this accomplishment second to that of organizing and developing experiment station work under the Hatch and Adams Acts, or the co-operative extension work in agriculture and home economics under the Smith—Lever Act. In the latter case there was a new idea in agricultural education to be tried out on a broad scale. If it should prove successful the extension system promised to be the most intimate and effective means for carrying precise and specific information to the farm people.

Thanks to the efficient organization which was built up, the extension system did work, and it worked so well that in the years since the first county agent went out to his work the number of county agents, home demonstration agents, club leaders, and extension specialists engaged in extension work has increased to about 5,000 specially trained men and women—the infantry of the Department of Agriculture and the state agricultural colleges; the live, intimate, friendly personalities who help the farmer and the farmer's wife, as well as the boys and girls of the farm, in their daily battles with farm problems.

The ideal of service to the farmer that is the motive power back of every project of the Department of Agriculture is expressed by the States Relations Service, mostly in terms of agricultural and home demonstration agents—"men and women county agents". The department aims to have one each of these useful citizens in every county in the United States. At present, the score shows one-third of the total number of counties supplied with both, one-third with men agents only, and one-third with none at all. The battle is not yet won—there is still much to be done in the way of organizing the co-operative forces throughout the country, and training men and women for the very exacting work of the profession, but the Doctor is steadily scoring his quiet victories, and he will win for his idea, if there is any virtue in straight thinking, clear vision, and unwavering faith in the cause he advocates.

Dr. True's relaxations and recreations are what one might suppose them to be—travel, trout fishing, and botanizing. He loves to spend his vacations in the beautiful Champlain country of Vermont, where he finds ample opportunity to indulge in his pastimes. His Vermont neighbors remember instances when, with the hay out, and a summer storm approaching, they have welcomed the appearance of the scholarly volunteer and his pitchfork. In these tasks as well as in the greater work of the office he holds, in the Department of Agriculture, Dr. True has been as loyal in nature as he is True in name.

DR. A. C. TRUE, DIRECTOR, STATES RELATIONS SERVICE, UNITED STATES DEPARTMENT OF AGRICULTURE

Pennsylvania Farmers Seek Accredited Herds

A recent meeting in a small community in McKean County, Pennsylvania, was held of the dairymen of that particular community on the night of July 6 for the purpose of discussing the value of tuberculosis free cattle in milk production.

After discussing this subject for nearly two hours, 37 men stepped forward and signed agreement blanks applying for the federal and state test, through which plan the herds are to be accredited.

The farmers of this community are to be paid a premium of ten cents for every hundred pounds of milk that comes from tuberculosis free cattle. These farmers are not large producers, but the ten cents per hundred will mean on an average to all the dairymen of this community an increase of the yearly income of at least $180.

Since that time the work has been progressing quite steadily so that McKean County will soon be on the map as one of the foremost in eradicating tuberculosis.

P. S. CROSSMAN, County Agent.

You can't can corn for folks without cans; and you can't can corn for cows without a silo. Have you enough silo capacity on your farm?

It isn't so much a question of what tools you use in gardening as how much you keep those working that you do use.

Thrift in Handling Straw

ORIN CROOKER, ILLINOIS

AN Iowa farmer handles considerable of his straw by passing it first through a baler. "Like many other things, straw is best," he states, "when it is clean and fresh. I go after the straw pile just as soon as I can following threshing. I like to get to it before it rains, for it seems to me straw is never quite the same as it is when it is baled from the fresh stack. Putting straw into a bale insures its future condition, since it is always possible to find a place to put it under cover. This isn't the case, of course, with loose straw, but if one happens to be short on mow space the bales can be stood or piled in the outbuildings almost anywhere until they are needed. In such condition it is easily moved from place to place if necessary. I usually bale up more than I think I'm going to use and along late in the winter I take stock, as it were, and sell about what I judge to be my surplus. There appears always to be a market for straw that has been baled.

"Stock will eat considerable straw if it is bright and crisp. That's the reason they nose into the stack in the barnyard. The less the straw has weathered the better they like it. I aim to have such a stack for the animals to browse around, but I bale first of all as much or more than I know I'm going to use in the stables and inside feed racks. The stock can munch over what's left and trample it all they please. Eventually it goes to the fields. I never have to use any of it in the stables.

"Baling pays in other ways aside from making it possible to store a lot of it in a small space. It is easier to get it into the stables for one thing. Did you ever try to dig straw out of a stack in a high wind? Well, then you know what I mean. And it stirs up far less dust to open a bale of straw and distribute it as litter than it does to pass it down from a mow overhead. There's some advantage in that, too. Straw isn't appreciated by most farmers because they don't handle it right. It's got more fertility ton for ton than manure and will produce more humus in soil than an equal quantity of barnyard waste. There are but few other materials that will absorb more liquid manure—and on top of this it is a good roughage for certain farm animals. It costs a little money to bale it, but I clear out on the expense through what I sell later on."

SAVING STRAW FOR WINTER

It is sometimes difficult, if not impossible, to build a good straw stack that does not waste half the straw. By baling, the straw may be put under cover and saved for winter feed for horses and for bedding at the end of the winter when otherwise it would be gone or of poor quality.

Southern Wisconsin Guernsey Breeders Organize

Fifty southern Wisconsin Guernsey breeders met at Whitewater on July 27 and organized the Southern Wisconsin Guernsey Breeders' Association. A meeting had been held at Janesville two weeks previous, at which time preliminary arrangements for the organization had been completed.

After adopting a constitution and by-laws the following directors were elected: Wayne A. Munn, Ralph Tratt, James H. Murphy, Otto Onstad, T. Ridge, P. C. Burchard, H. A. Main, A. S. Knudsen, and Grover Kull. The board of directors selected the following officers: Wayne A. Munn, president; Ralph Tratt, vice-president; James H. Murphy, secretary-treasurer.

The purpose of the organization is to assist in sales and purchases, arrange Guernsey meetings, and carry on co-operative advertising. At the organization meeting definite steps were taken to hold a sale of seventy-five pure-breds at Janesville on October 14. This sale will be under the immediate management of the board of directors. The members present were emphatic in deciding to run a strictly high-class sale. They agreed that the committee should subject every animal consigned to a rigid inspection, and list only those of approved individuality and acceptable breeding record. With the numerous excellent herds in this locality, the members felt that in no way could they co-operate to greater advantage than by establishing a reputation for quality and guaranteed satisfaction.

Breeders from the following counties are enrolled in this association: Rock, Green, Jefferson, Dane, Walworth, Kenosha, and Racine. Many of the largest and best herds in Wisconsin are to be found in this locality, and many hundreds of the choicest pure-bred and grade Guernseys have been bred and owned on the farms of this part of Wisconsin for many years. Their excellence alone heretofore created a sufficient market, but the breeders hope by organizing to give buyers better service, and bring to their excellent herds the publicity they well deserve.

Wisconsin. JAMES H. MURPHY.

Yield of Each Cow Figured for You

By the CP Pail Balancing Scale

Has two indicators. Weighs the milk in the pail. Eliminates errors. First hang the empty pail on the scale. Turn the thumbscrew in the center of the dial, which moves the red indicator until it is at the 0 mark, thus balancing the weight of the pail. Then add the milk or cream and the result shown by the red indicator gives the net weight of the milk or cream, and at the same time the black indicator gives the gross weight of pail and milk.

The capacity of these scales is 30, 60 and 120 pounds, according to size, in pounds and tenths of pounds. With each scale we furnish special blanks that will contain the record for two milkings a day for one week for 14 cows.

The scale can also be used for all weighing purposes.

Price each, 30 lbs. capacity by 1-20 lb. $4.55, 60-lb. $5.65, 120-lb. $8.85. Postage 30c extra. Extra records per dozen, 15c.

Price each 4.55

"I bring Better Butter Prices ~ because I keep Butter Better"
Paterson Parchment

More Profit From Butter

No matter how good *you* consider your butter, your *customer's* opinion governs the price you get for it.

Butter is always fresher, sweeter, cleaner and more salable when it reaches your customer wrapped in

Paterson Pioneer Parchment Paper

And butter so protected from dirt, dust and bad odors, brings top market prices.

Paterson Parchment comes in rolls, sheets and circles to suit all methods of marketing.

Write for free samples and book, "Better Butter". Full of valuable information for every dairyman.

AJAX CORD

EXCLUSIVE features built into the Ajax Cord combine to give the extra life and strength which "country" service requires.

First and foremost is the method by which these tires are constructed.

Each ply of cord is laid gently in position—*never pulled or stretched.* This means that full resiliency is retained, so that the tire can flex and give as it should when it strikes a rut or bump.

And that Cleated Tread — it holds like the heavy calks on a horse-shoe. And those "Shoulders of Strength,"— they brace and re-inforce the tread.

There is exceptionally good mileage in Ajax Cords. Your car should wear them.

Ajax Cord, Ajax Road King, Ajax Tubes and Ajax H. Q. (High Quality) Tire Accessories, are sold by Ajax Franchised Dealers everywhere.

PAT. 7-2-07
ANTI-COW-KICKER
Save your temper, your cows, your milk. Does not excite the cow, nor disturb the flow of milk. Indispensible for breaking heifers, cows with sore teats, or vicious kickers. Cannot wear out. Put on or off in 15 seconds. Guaranteed to be an absolutely perfect anti-kicker, or put on loosely as hobble for cow, horse or mule Price $1.15 Postage extra. Weight 2 lbs. Send for it **today**, when you need it you won't have time.

DAIRY EQUIPMENT CO.,
Dept. H. Topeka, Kansas.

TABER LINED SILO

"LINED" (Pat. App. for) Acid-Proof Lining keeps air out—and moisture and juices of corn away from staves. Prevents rot—freezing and spoilage.

Shipped in 24 Hours
Made of *absolutely clear* Long Leaf Yellow Pine boiled in Creosote. Acid-Proof Lined, Painted outside, Double Anchored. Won't blow down.

Non-Shrinkable
Rot-Proof Acid-Proof
No shrinking or swelling of staves. No frozen silage. Finest circle doors and frame.
FREE BOOK (just out) on Silos and Silage. *Write for it Today!*

GRADING BUTTER

W. B. LIVERANCE, NEW YORK

TO the inexperienced, the terms applied to the different grades of butter mean very little. To the average producer of milk and cream, what is the significance of the term, an extra? Which is considered of better quality, butter that is classed as a first or as an extra? Ordinarily, one would feel that a grade of butter which was classified as a first would be of top quality. However, such is not the case as a first is considered an undergrade in all butter markets. Why there should be an apparent ambiguity in grading butter is difficult to understand but it is very probable that the whole system of classifying butter according to grades is a development of years, and a natural conservation that obtains in all markets has caused the ambiguity.

In grading butter, three physical senses, viz., sight, smell, and taste, are brought into use. Occasionally, when the butter judge lacks confidence in his judgment on a certain sample of butter, a fourth sense, that of hearing, is allowed to play a part in that the judge allows himself to be influenced by the opinion of others. That, of course, is a condition to be deplored. There is a considerable criticism of the present day method of grading butter because two equally competent judges will have widely varying opinions of the same piece of butter. It must be remembered that all judges of butter are subject to the frailities of the human body and that factors affecting their physical well being may warp their judgment at times. To the writer's knowledge, a certain authority on butter, who was considered to be an excellent judge of butter quality, scored a tub of butter before going to lunch. Upon returning from his noon-day meal he inadvertantly rescored the same sample. The difference in score occasioned by his changed mental attitude after having the inner man satisfied was a full seven points. This instance merely serves to show the unreliability of the human senses, particularly that of taste, when it comes to passing judgment on a food product. Grading butter, however, can not be done on the basis of a mechanical formula, hence the method that is practiced is the only one that can be employed.

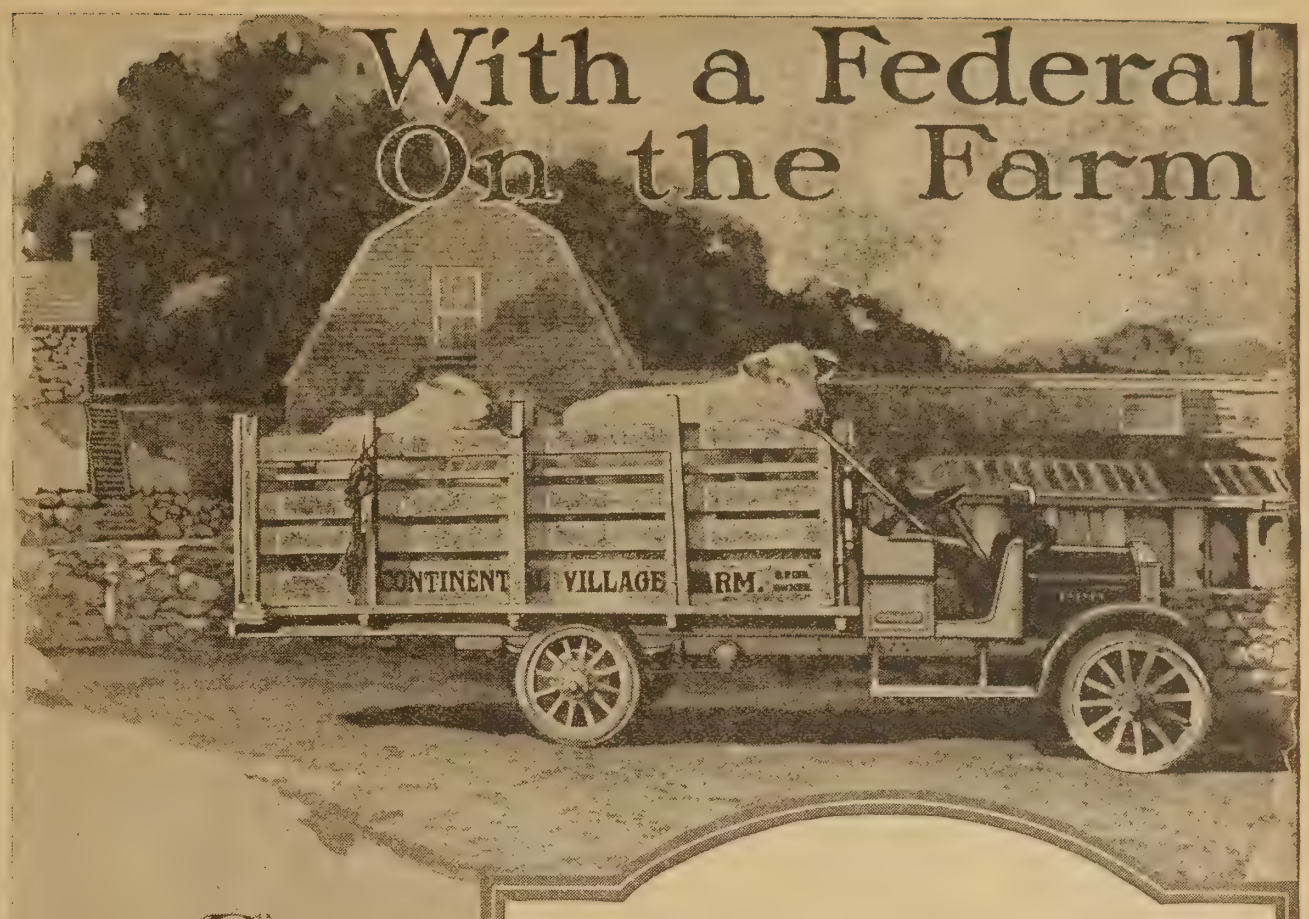
Theoretically, if a piece of butter were perfect in every respect it would be scored 100 points. However, as yet, never in the judgment of any authorized butter judge has a theoretically perfect sample of butter been made. It always happens, and undoubtedly always will, that there is some characteristic of any sample of butter that will not correspond with the theoretically perfect butter. As a rule, the principal deduction made in scoring butter is on flavor, that being, very naturally, the most important characteristic of butter. It frequently happens, however, that deductions are made because of nonconformity to standard of any of the other characteristics of butter that are given consideration in placing a numerical score on butter. The theoretically perfect piece of butter would show the 100 points distributed as follows: Flavor, 45 points; body, 25 points; color, 15 points; salt, 10 points; package, 5 points. The total points allowed for each characteristic is supposed to represent the comparative value of that characteristic so far as it influences the quality of butter. However, in a commercial way, the distribution of points may not always be equitable, but for practical purposes no better scheme can be devised.

KAYEWOOD JOYCE KORNDYKE

Her 7-day production of 607.5 lbs. milk, 31.3 lbs. fat, makes her champion of Pennsylvania. She has recently completed a 365-day test of 24,548 lbs. milk, 892.72 lbs. fat. She is owned by Bell Farm.

The placing of a numerical score on any of the characteristics of butter is a matter of judgment on the part of the judge. No one can develop ability to grade butter over night, but it requires years of experience and even then some who have devoted the greater part of their lives in passing judgment on butter lack confidence in their ability in that regard. In scoring butter, the judge uses an instrument, known as a trier, with which he draws a pencil of the butter from the entire depth of the sample to be scored. The odor of the butter is noted as the trier is withdrawn from the mass as it is at that time that the volatile odors, which indicate the flavor of the butter, are most noticeable. He then judges of body, or texture, of the butter by noticing if the trier full withdrew from the mass without breaking, if the brine on the under side of the trier is free from buttermilk, and if there is no butter adhering to the trier. Also, the butter is broken to see if the grain resembles the grain of a piece of steel when fractured. His experience then assists him in placing a numerical score on that particular characteristic of the butter. By tasting of the butter and bearing in mind its odor he can pass judgment on the flavor.

Unless there is something radically wrong with the other characteristics



of butter, the sample is passed as perfect in regard to them. The color may be either high or low and yet the butter will not be scored down. However, if there is unevenness of color, if there is waviness of color or mottles a reduction will be made. Uneven coloring is a very undesirable characteristic. Mottles will place the butter in the grade of a second even though the flavor is excellent. While certain markets may desire a butter of low salt content, and others demand a high salt, the butter is not reduced in grade unless the salt is in excess or is undissolved and shows a gritty condition. It then rests with the judgment of the judge as to how much the score will be cut. While the package is given little consideration and is rarely given anything but a perfect score, it has a marked commercial influence on the sale of butter as the buyer is oftentimes prejudiced against certain lots of butter if the package is dirty or unattractive. However, the judge considers the characteristics of the butter itself rather than its container. When all of the characteristics have been given a numerical score and the several scores added the full score of the sample is available and it is then placed in the grade in which it belongs.

The grade of the butter is automatically fixed by its numerical score as rules of the various produce exchanges govern that feature. In the New York market grades of butter are known as extras, higher scoring than extras, firsts, seconds, and lower grades. Formerly a further classification into thirds and fourths was given but such low grades are of no commercial value. Extras is a class of butter that will score 92; higher scoring than extras means butter that will score 93 points or higher; firsts score from 88 to 91 points; seconds, from 83 to 87 points; and, lower grades constitute all grades of butter inferior to a second. The term, "packing stock" applies to butter of inferior quality, which invariably falls in the class of lower grades, which is of no value except to be made into renovated butter. It requires no expert judgment to classify it.

While the numerical scoring of butter and the grading of it is subject to much criticism it is very necessary in all butter markets, as it is the only way by which butter can be marketed on an equitable basis. The one just criticism of the method that is in vogue is that there is no uniformity of opinion among judges of reputation as to what constitutes a theoretically perfect butter. Then, too, judges in the large markets oftentimes allow conditions to warp their judgment in grading butter. If the judge knows that by scoring a lot of butter higher than it really should be, the merchant can profit thereby, providing the inspector is himself safe in doing so, he invariably will do so. On the other hand, if he may get himself criticised by grading a lot of buttter as high as it should be during a time of considerable supply, he will underscore it. The grading of butter is largely influenced by the mental and physical condition of the judge, but, on the whole, it is very satisfactory. It is to be regretted that frequently judges allow themselves to be influenced by desires and opinions of interested parties in placing scores on certain lots of butter.

Larger Dividends from Fresh Cows

"In order to get a good start when she freshens, a cow should have six weeks' rest prior to the new lactation period," says L. V. Wilson, University Farm, St. Paul, agent in dairying for the United States department of agriculture. "Cows that are to freshen in the fall, therefore," adds Mr. Wilson, "should receive the best of care before freshening. It is often impossible to dry a cow up if turned on pasture such as exists this season. It is better to limit her to dry feeds, very litle grain, depending on dry roughage such as clover and alfalfa. Having dried the cows off, one may start them if time will permit. A cow in poor condition at the start of her lactation period is not capable of the best, as the feeds she consumes following freshening must be devoted largely to the building up of the body rather than toward the manufacture of milk and butterfat."

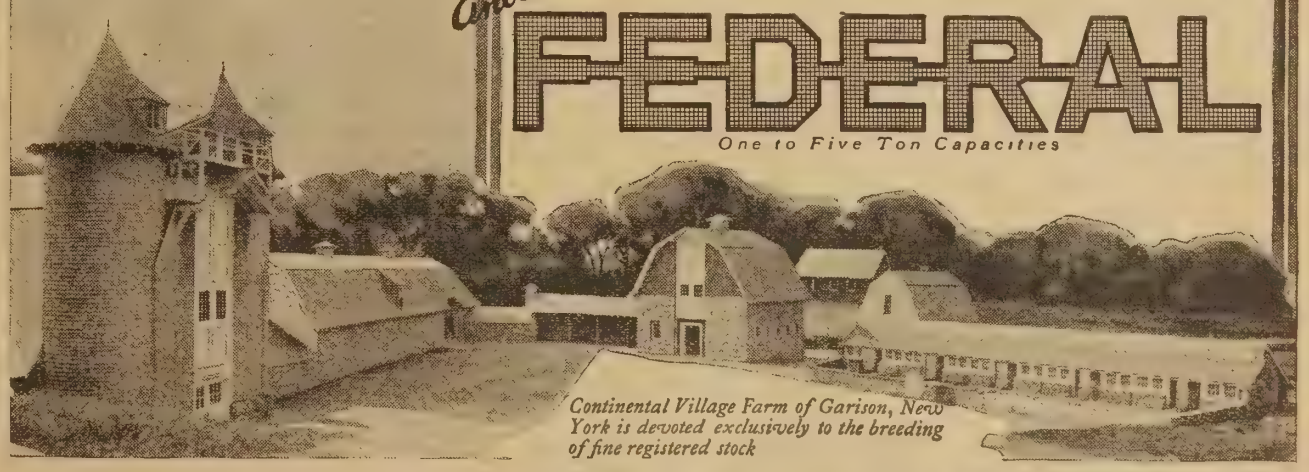
The Tenth Year FEDERAL Trucks

This tag is the sign of the Tenth Year Federal

Thoroughbreds—

Transporting cattle to fairs and expositions so that they always arrive in the pink of condition calls for qualities not commonly considered in the selection of a motor truck.

Perfect ease in riding and control and an unfailing reliance on the truck to reach its destination with more than ordinary dispatch and certainty are absolutely essential.



Extra qualities, to be sure, in a truck, but it is the extra qualities that fine cattle and trucks possess over the common herd that marks so surely the thoroughbred.

For ten years now Federal has been building into trucks this extra measure of economy, dependability and endurance that has marked it everywhere as a thoroughbred truck.

FEDERAL MOTOR TRUCK CO., DETROIT, MICH.

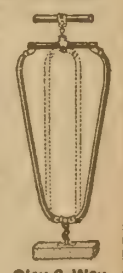
Another FEDERAL

One to Five Ton Capacities

Continental Village Farm of Garison, New York is devoted exclusively to the breeding of fine registered stock

Clay Steel Stall —Only 3 Parts

Contented Cows Give More Milk



The dairy cow is "temperamental." No farm animal responds more generously to good treatment. None is so quickly and adversely affected by anger, fright or discomfort. That's why safety, orderly handling and pasture comfort in the dairy barn insure more milk and greater profit. These necessary features, with economy and convenience, are provided by

CLAY Sanitary Cow Stalls

Bolting only 3 parts together completes a **permanent** stall of smooth, strong steel tubing. No dangerous corners. No cumbersome castings. Easily kept clean. CLAY 2-Way Stanchion is instantly closed or opened **both ways** with **one hand.** Adjustable to any size cow or heifer. No sure-stops needed. Cow-proof lock. Users say CLAY Equipment quickly pays for itself. **Reasonably Priced.** Fully guaranteed. **Sold on 30 days' trial.**

Silver's "Ohio"

The Logical Silo Filler

5 sizes—
Daily Capacity
50 to 250
Tons

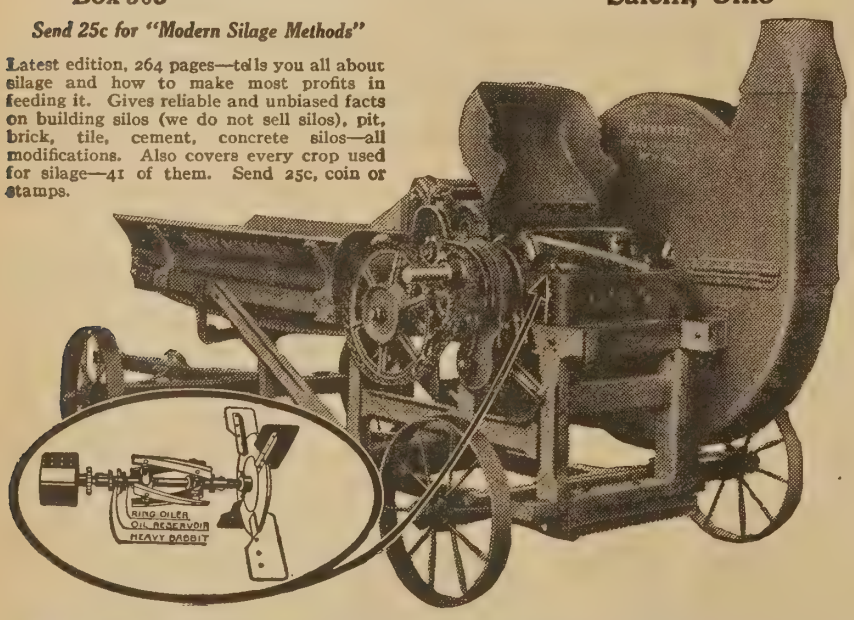
Cut your feed costs—give your stock highly nutritious "Silverized" silage—short, clean-cut, uniform, that packs solid and ferments evenly. The sugar juices mix better—the pulp and fibre is broken down, making it more digestible. Your herd will give a bigger yield on it and be less "scrubby" in the spring.

The "Ohio" makes you independent of filling crews—you can cut silage at any time. The "Ohio" is light running. There's a size for every power. "Ohio" 11 and 13-inch throat for 6 and 8 h. p. gas engine up to the 19-inch throat with 250 tons capacity daily for larger tractors.

The sturdy, cylinder-type knives, backed by 14 inches of ring-oiler bearings, give a positive quick shearing cut and cannot jam. Revolving like a buzz saw, cutting only 5 inches from the shaft, and with patented knife-block adjustments—no leaves, shreds or joints can possibly pass uncut. The Beater self-feed *saves a man.* The friction reverse prevents gear stripping. A single lever controls stopping, starting or reversing, at finger pressure.

Drive pulley, cutting cylinder and blower fan, though separate, are all on one shaft. Bevel gears are eliminated—the direct drive saves power. The blower fan is *explosion proof.* The "Ohio" is *safe.*

65 Years of Experience Back the "Ohio"



The "Ohio" is durable—built for a lifetime of service. It has enormous capacity and strength. Operating costs are unusually low. Made in 5 sizes—easily converted into shredders by changing the knives. Suitable for pit silos or fodder cutting. Works without blower if desired. Write for color catalog *today*—free.

We are pioneers in the manufacture of silo fillers and have kept ahead of all improvements. There are now probably more "Ohios" used by Experiment Stations and Agricultural Colleges than all other fillers combined.

The Silver Manufacturing Company
Box 303 **Salem, Ohio**

Send 25c for "Modern Silage Methods"

Latest edition, 264 pages—tells you all about silage and how to make most profits in feeding it. Gives reliable and unbiased facts on building silos (we do not sell silos), pit, brick, tile, cement, concrete silos—all modifications. Also covers every crop used for silage—41 of them. Send 25c, coin or stamps.

Save your corn!

THE only sure way to save your late corn that has a big chance of being frosted, is to put it in a Silo.

You can get an Indiana Silo NOW, it can be erected by three or four men in one day and filled the next day. Our stock is complete in all size silos—we can fill orders promptly.

Order now—SAVE YOUR CROP while you can!

Association Notes

Richfield, Wisconsin:—One carload of oil meal was purchased through the local dealers at $69 per ton. Six unprofitable cows were sold, three milking machines installed, and one electric light system installed. Pasture is the poorest it ever has been in this county. Some members are trying to keep up production by supplementing hay and green corn. The majority of members have whitewashed their barns. In July the condensery paid $3.10 per cwt. for milk and the cheese factory 78c per pound for fat.

Ellington, Wisconsin:—One carload of oil meal was purchased at $69.50 per ton. The condensery paid $3 per cwt. for 4% milk and the creamery paid 60c per lb. for fat in July.

Rockfield. Wisconsin:—Three milking machines have been installed, two concrete silos built, and three barns remodeled and equipped with stanchions. The condensery paid $3.10 per cwt. for 4% milk in July. Fifty tons of oil meal were purchased.

Byron, Wisconsin:—Farmers are feeding silage if they have it and it makes a big difference in the amount of milk the cows give. The creamery paid 72c per lb. for fat in July and the cheese factory paid 60 to 68c.

Fort Atkinson, Wisconsin:—Silage is supplementing the majority of the short pastures. When silage is lacking, hay is used. July milk sold to the condensery for $3.20 per cwt., 4c being paid for each point above 3.5%. The creamery paid 59.64c per lb. for fat. Feed prices are: Hay, $25 per ton; silage, $7; oil meal, $70; bran, $53; corn and cob meal, $55; gluten, $68; oats, $1 per bushel.

Butler Road, Ohio:—This association is buying feeds co-operatively. It has weeded out four poor cows and is buying good registered Holsteins in their places. July market milk sold for $3.50 per cwt., 5c being paid per point above 3.5%.

Madison County No. 1, Illinois:—We have now reached the time when the dairymen are letting their cows go dry, the draught and flies assisting them greatly in this, and also the high, almost forbidding prices on feed. In July the condensery paid $3.25 for 3.5% milk, and 4c per point above this test. Milk retails for 14c per quart and butter for 70c per lb. Clover hay is rated at $30 per ton; alfalfa, $32 to $35; cottonseed meal, $4.25 per cwt.; hominy, $3.70; ground corn, $4.30; bran, $2.80.

Rutherford County, Tennessee:—Several members of this association have been selling off their grades and low producing registered Jerseys to make room for more pure-bred animals that will make the R. of M. in the future. Many of the dairymen are also adopting more scientific methods of feeding. Milk retails for 8c per quart and butter for 70c per pound.

Wilson County, Tennessee:—The fifth month of this association ended with a very creditable showing. Wonderful progress has been made in weeding out the boarder cow. Several pure-breds were purchased during these months. One new concrete silo was erected and one milking machine installed. The creamery paid 61c per lb. for fat in July. Cow Chow sold for $4.40 per cwt.; Schumacher, $3.50; Dairy Feed, $3.50.

Geauga County, Ohio:—July market milk sold in this community for $3.25 per cwt. and 5c for each point above 3.5%. Gluten is rated at $3.30 per cwt; hominy, $3.85; oil meal, $3.34; bran, $3.25.

Contoocook Valley, New Hampshire:—Twelve Jerseys from two herds were tested for yearly records. One pure-bred Guernsey bull was purchased, Pride's May Day of Knollwood, an excellent show ring individual. Two profitable and sixteen unprofitable cows were sold. Feed prices are: Bran, $60 per ton; gluten, $87; cottonseed meal, $78; oil meal, $72; Union grains, $85; ground oats, $90; corn meal, $80; flour middlings, $70; mixed feed, $67; stock feed, $67; Four X, $75.

Western Broome, New York:—Improvements for July are few, as other farm work requires so much extra time that the dairying is somewhat neglected. As usual, all cows show a marked decrease in production for July. Pasture is short and flies bad. In general, hay is a light crop and other crops backward. July 3% market milk sold for $2.95 per cwt. Milk retails for 14c per quart, butter for 60c per lb., and cheese for 40c per lb. Gluten is rated at $72 per ton; oil meal, $73; cottonseed meal, $74; hominy, $74; wheat bran, $64.

Wahkiakum County, Washington: The creamery paid 55c per lb. for fat in July. Feed prices for the month were as follows: Linseed meal, $5 per cwt.; prepared dairy feeds, $3 per cwt.; rolled oats, $4; and mill run, $62 per ton.

Stillaguamish, Washington:—Several cows have been sold for beef. The members of this association will buy their hay through the United Dairy Association of Washington. June market milk testing 3.6% sold for $3.20 per cwt. and 7c per point above. Milk retails for 13c per quart and butter for 70c per lb.

Clinton, Pennsylvania:—During the month, the fine herd of John Gewther was sold at public auction and several of the association members made purchases at the sale. Twenty-nine unprofitable cows were culled from the

different herds, and many more will follow. May market milk testing 3.7% sold for $2.53 per cwt. and 4c per point above. The creamery paid 62c per lb. for fat. Milk retails for 7c per quart and butter for 65c per lb. Feed prices are: Gluten, $85 per ton; cottonseed meal, $86; horse feed, $90; mixed feed, $69.

Western Allegan County, Michigan:—July market milk testing 3.5% sold for $3.20 per cwt. and 4c to 6c per point above. The creamery paid 56 to 60c per lb. for fat. New hay is rated at $20 to $25 per ton; silage, $8; Unicorn, $80; Larro, $80; cottonseed meal, $83; oil meal, $80; middlings, $70; bran, $64; corn and oats, $85.

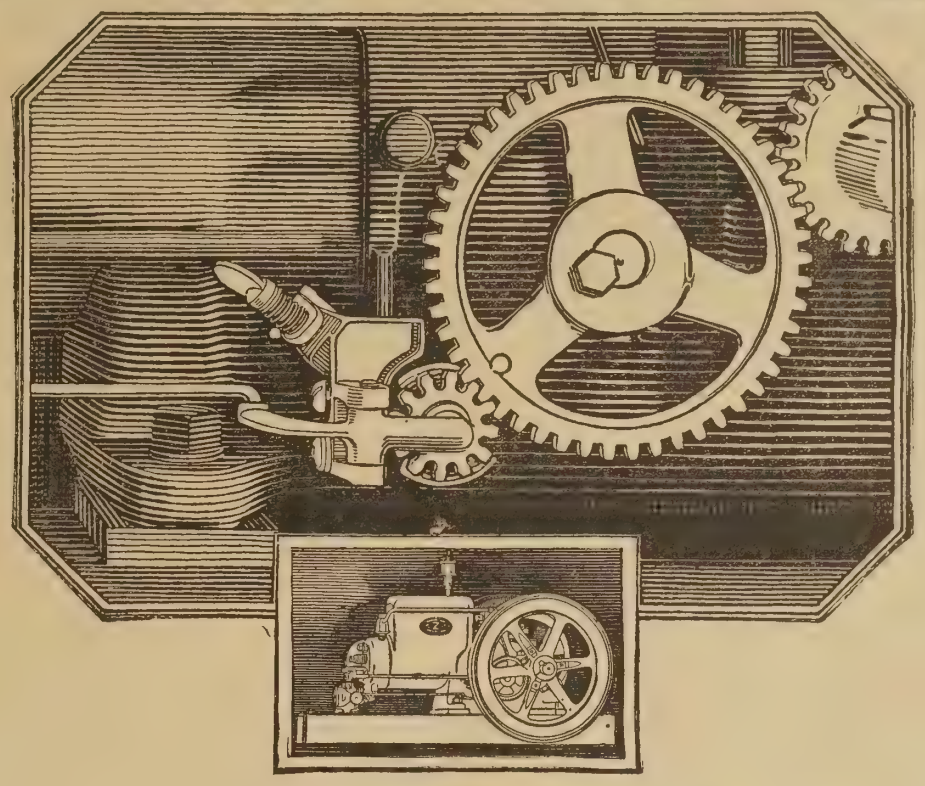
Tyler Hill, Pennsylvania:—I. L. Canfield owns the best two-year-old in this association. He says it pays to feed cows, especially during the hot days of July and August. Corn for silage does not look very promising in this vicinity, with the exception of a little situated on the hills with red shale foothold. July market milk testing 3% sold for $3.02 per cwt. and 4c per point above. June market milk sold for $2.92 per cwt. and 4c per point above 3%. A carload of gluten was purchased in June, and it is expected that a carload of cottonseed meal and linseed meal will be bought.

Southern Blair County, Pennsylvania:—Six poor cows were sold and one pure-bred sire purchased in July. Market milk sold for $3.42 to $6.72. Corn and oats chop sold for $70 per ton; Larro, $80; oil meal, $75; cottonseed meal, $80; International Dairy Feed, $79.

Idaho Short Course in Dairy Manufacture

Dairying in the West is a prospering industry. Manufacturing plants are growing rapidly and increasing in number to take care of the raw products. Experienced and well trained men are in demand to take charge of such plants.

The University of Idaho this winter is offering, in addition to the regular four-year course in Dairy Husbandry, a five-months' course in practical commercial dairying, to meet the demand for factory operators. No longer have guess-work methods and slipshod management a place in modern dairy manufacturing. Upon sanitary and efficient dairying depend much of the health and prosperity of the nation.



Employers all look for trained men who know what to do and how and why to do things under various conditions. Most of the mechanical work can be done by machinery, but an employee should be able to think, to improve, and to perfect plant operations. To do this, he must know the fundamentals that underlie modern practice, every detailed step of procedure, and every precaution necessary to insure a wholesome product. Without this fundamental knowledge he is lost in his work and unable to progress.

The five months' course offered by the University of Idaho beginning October 12 is meant to give to practical dairymen an understanding of the fundamental principles of dairy manufacturing. All applicants sixteen years of age or over having completed eighth grade work are admitted without examination. Others may enter if they are deemed qualified to undertake the work. A fee of $5 a term is charged to cover supplies and breakage. No tuition is asked.

A three-story brick building is devoted to the work in dairying, providing classrooms and laboratories with the necessary equipment for buttermaking, cheesemaking, ice cream making, and the testing of dairy products for fat, moisture, salt, adulterants, acidity, etc.

Idaho. H. A. Bendixen.

FAIRBANKS-MORSE "Z" FARM ENGINES

Throttling Governor Gives Steady Speed

Every "Z" Engine is equipped with a sensitive throttling governor. Regulates the amount of fuel and air admitted to cylinder—maintains uniform speed—summer or winter, regardless of work being done.

Throttling governor enables the "Z" to run on kerosene as well as gasoline—saves you money.

Governor is a complete, high grade assembly unit—not a makeshift device. Its case-hardened contact parts resist wear.

The throttling governor has mighty important duties: Helps maintain uniform cylinder temperature—gives smooth, steady flow of power that saves wear and tear on belts and the driven machinery.

Other "Z" features are: Bosch magneto, more than rated power, parts interchangeable; clean cut design; long life.

Go to your nearby dealer today and see the "Z." He will show you why you should have one.

High School Agriculture

The agricultural department of the average high school in Wisconsin is doing a commendable work in the improvement of the general farming conditions in its community. These departments are under the direct supervision of directors who are trained agriculturalists. These directors in order to be successful must be able to meet the farmers and to advise them wisely concerning the better methods of present day agriculture. These directors must be rural minded to such an extent that they can make the boys from the farms who attend our high schools see the possibilities of the farm and to fire them with a determination to return to the farm after having attended high school for four years.

The projects which are worked out in connection with the class work give the boys valuable training and information concerning the underlying principles of successful agriculture. Since the projects are usually worked out by the boys at home on the farm, the benefits derived extend beyond the class room. The fathers and the neighbors usually watch these projects with considerable interest. In the majority of cases they also learn something of value.

The writer has just had the pleasure of visiting the boys who are carrying on projects under the direction of H. M. Knipfel, director of agriculture in the Neillsville high school, Wisconsin. One of the best projects noticed is a pure-bred pig club. The members are either students in the high school or in the rural schools of the vicinity. The club meets regularly to discuss the feeding and the care of hogs. The way the young farmers discuss the value of the different rations and kinds of green pastures for hogs proves the value of the work.

This club is financed by the Commercial State Bank of Neillsville. The bank purchased 12 pure-bred Chester White sows. These sows were given to 12 boys who are attending the schools. In payment for the sow each boy is to give the bank the choice of two of the litter when the pigs are about eight months old. These 24 pigs are then to be given to 24 more boys. This work will result in making the county a center for Chester Whites. The boys now own some 90 registered Chester Whites. All of these pigs are to be exhibited at the county fair when the officials are offering liberal prizes. Although the club was financed by the bank, the work is being done under the supervision of the agricultural department of the high school.

There is no question but that work of this nature will do much to keep the majority of these boys on the farm. Since one of the problems of the day is to keep farm boys interested in the farm and to eventually make successful farmers out of them, it seems that agricultural departments ought to receive the best thought of the high school educators of the state.

Wisconsin. E. J. McKean.

EDITORIAL COMMENT

BREAD AND MILK

It is recognized by those who employ a large number of people that efficiency is not wholly dependent upon mental training. Men and women must have healthy bodies before employers can expect 100% efficiency.

Results of investigations concerning the nutritive properties of milk have lead employers of labor, in many instances, to advocate its use and in a few cases employers are serving bread and milk lunches to their employees.

The Fleischmann Yeast Cake Company started the practice of serving bread and milk lunches to its employees several months ago. Its vice-president, Mr. Joseph Wilcher, writes the National Dairy Council concerning the results, as follows:

"We believe that the resulting health and efficiency among our employees is higher by at least 50%.

"When Chicago concerns were complaining of a 25 to 50% shortage of help during the last influenza epidemic, the shortage at The Fleischmann Company's office was practically nil and our absentee list is low at all times. It is a simple proposition: Bread and milk is food with 100% nourishment. Taken regularly each day it is bound to build up health which increases powers of resistance and produces greater energy in daily work. That is the way it is working out with us. I am glad to give the bread and milk office lunch my personal endorsement."

BONE MEAL FOR COWS

In recent years more attention has been given to the necessity of mineral feeds for farm animals than in the past. The increased efficiency of dairy cattle brings about new problems. The native cow, or the cow that is permitted to freshen in the spring and go dry in the fall, could gather sufficient amount of nourishment in grasses to sustain her milk flow, and to provide her with adequate nutrients to keep her body in a healthy condition and to produce strong, healthy calves.

The increased milk function has put a much larger strain upon the cow and this in turn has led to the necessity of providing her with a different system of feeding. It must be borne in mind, too, that many cows are fed liberally of by-products from our mills and many of these do not contain the mineral content found in the natural grains.

Professor E. B. Forbes of the Ohio Experiment Station has devoted many years of research in order to determine the mineral requirements for various kinds of farm animals. He points out that rations abnormally poor in mineral matter may be due to excessive proportion of grain to roughage in the ration and that roughage grown upon impoverished or infertile soil is poor in mineral nutrients.

Professor Forbes states that the best form of mineral matter, as well the safest to use, is steamed bone meal finely ground. It is termed by some as bone flour. This product contains a liberal supply of calcium and phosphorus. There are certain conditions when calcium may be the only mineral needed. Ground limestone or marl has been used, but as pointed out by Professor Forbes phosphates are more palatable than carbohydrates, and may be taken in much greater quantities without disturbing the digestion.

The dairyman must bear in mind that milk is very rich in mineral matter, bone making material, and unless the soil on which the forage, such as alfalfa or clover, is rich in available mineral matter, the rations are likely to be short of these substances, especially if the cows are heavy producers. Professor Forbes in his experiments did not discover that the bone structure of the animals fed bone meal seemed to be any larger, but rather the bones were more solid and stronger, and the animals seemed to remain in better health, although there has not been discovered an appreciative increase in the milk flow, but he found the animals resisted disease better and the reproductive function strengthened, all of which are highly essential to the development of high producing dairy cows. It may be said a number of good dairymen believe that feeding mineral matter liberally tends to prevent abortion. It should not be inferred by this that mineral matter is a specific cure for abortion, but by keeping the reproductive organs strong and vigorous, there is less opportunity for this disease to develop. It is our opinion that unless a dairyman feels his cows are getting a liberal supply of mineral matter, that he could afford to feed three or four ounces daily of bone meal to each cow. It is not infrequently observed that cows eat earth, manure, and various other materials. This indicates the rations lack something and it is generally held to be mineral substances.

COWS FOR MILK

Since the inception of Hoard's Dairyman, we have fully appreciated that men who keep dairy cows do so for the returns that they bring for the milk and other dairy products sold. This is why we urge every dairy farmer who keeps cows to know the returns they are giving. We desire the cows to keep the dairy farmer rather than the dairy farmer to keep the cows.

The best way of determining whether cows are profitable or not is to know how much milk and fat each animal produces and what the herd will average one year with another. We are a little surprised in reviewing the returns of the census taken by the Holstein-Friesian Breeders' Association of America to find that five out of six breeders of pure-bred cattle found the sale of milk more profitable than the sale of stock. This shows that the breeders of pure-bred Holstein cattle are overwhelmingly engaged in the business for the returns they can obtain in the sale of milk and its products. It emphasizes the importance of all breed associations giving attention to factors which influence dairy conditions.

It is not enough, as President Aitken so well points out, that a breed association simply record pedigrees, but it must consider the whole dairy industry and create conditions that will make dairying profitable. When five out of every six breeders of pure-bred animals find milk and its products giving them larger returns than what is obtained by selling stock, it emphasizes the necessity of every pure-bred association having an interest in all factors that influence the return of dairy products. It is their business to help improve marketing conditions, to point out to the consumer the food value of milk and its products, and to provide such other conditions as will make dairying remunerative.

EDUCATION OR LAW

We are in hearty accord with the movement to eliminate all grade and scrub bulls and put pure-breds in their places. It is an educational movement which means much to the dairy interests of this country. In the canvass that has been made among the dairy farmers many useful lessons have been pointed out as to why a dairyman should choose efficient machines. The dairyman has no right to expect a profit from his cows unless he keeps good cows—those capable of converting the feeds of the farm economically into milk.

We would urge every educational and persuasive facility for pointing out the value of the pure-bred bull but we cannot place our approval upon a law which has been enacted in Ontario which compels a dairyman to keep a pure-bred bull. It is going too far to force a man to keep certain kinds of live stock. There is too much autocracy extended to governmental officials when they are permitted to enter a man's farm and force him to sell his herd bull and buy a pure-bred.

We understand that the farmers of Ontario are up in arms against the law which forces them to keep pure-bred bulls and a resolution was recently passed by a group of agricultural representatives asking for the elimination of the pure-bred bull enactment. We seem to be living in a time when we desire to govern every human activity with some law or regulation. It seems that we are not willing to let educational facilities and desires of the people have any part in their activities. Men and women do not make their best development under a paternal form of government. We need laws, regulations, and rules to permit freedom to carry out business and social activities, to prevent restraint of trade, monopolies, and profiteering but it is going too far when the state extends to its officials the opportunity of entering into private affairs and directing a person to follow the dictation of a group of individuals.

It is stupid indeed for any man to keep a scrub bull at the head of his herd if he desires to make a profit from his cows but the remedy, or the so-called remedy, in Ontario for the elimination of the scrub bull is far worse than the evil committed. Let us proceed with forces of education and persuasion to show the dairy farmer the necessity of good blood but let us look with disfavor on any law which forces him to carry on his business as may be dictated by a few governmental officials.

FORCED CO-OPERATION

We were in conversation with a person a short time ago who is very enthusiastic over farmers co-operating. He pointed out the advantages of farmers uniting in their products for market. We agree that the farmer would be better off if he would co-operate with his neighbor in the establishing of cheese factories, creameries, and co-operative selling agencies, for we know agriculture has been handicapped because farmers have sought to work individually instead of co-operatively.

This man went farther than we believe is wise for he stated that he would have a law forcing all farmers in a community where there was a co-operative enterprise, to support it. In this we could not agree. We do not believe in laws which force the individual to do certain things even though the doing of them would be to his advantage. We cannot conceive of a greater autocracy than to require every farmer in a community to support a co-operative creamery or cheese factory, pure-bred bull associations or cow testing associations. If farmers cannot, through their own initiative and desires, develop a co-operative enterprise and support it, no law will be successful in bringing them together. It is a matter of education, of a desire on their part to develop the business in the community together.

Some are concerned that if there is too much co-operation, individual effort will become lost; initiation destroyed, but we believe this concern is unwarranted. In the conduct of the farm, the handling of products, the breeding of live stock, the development of the farm home, and the many activities of the farm will leave a sufficient amount of work to keep and develop individualism. Uniting with his neighbor in the preparing of his products for market, in selling them, in establishing more direct routes for his products to market, and the various other enterprises which can be carried on co-operatively, will work to his advantage but to force him to enter into co-operation with his neighbors is tyranny—no less oppressive than that of kings but such is the conception of many of our so-called modern thinkers and reformers. These men are asking for freedom of the people but if their ideas were followed out, every person would be forced to follow a plan provided by them, to wear their yoke. Isn't it strange that they cannot see that this is tyranny?

An Extra Gallon of Gas and Oil

HOARD'S DAIRYMAN:—Dead engine. That means a walk to the next gas station. But with us it means that we pull up that back seat cushion and get a can of gasoline and go the rest of the way.

The carrying of an extra gallon of gasoline is a habit that I started about five years ago. One seldom finds a driver that runs very many miles a year who won't forget to look after the gasoline tank some time. It seems as though the mileage

decreases sometimes or we miscalculate the distance we've traveled and the first thing we know the engine dies on the road with that "I-hate-to-quit" sort of a stopping that every driver knows the sign of.

Most any one-gallon, cylinder oil can will make a fine emergency gas tank for your car. The can's top must be in perfect condition or it will leak. It is about as irritating to one's nerves to look for a gallon of gas in the tool box and find it leaked out as to not have any to look for. A tack got under my gallon can once and punched a little hole through the side of it and I didn't have the extra fuel. Now I watch for anything that might injure the can before it is packed away. I wrap the can in a burlap sack, too.

I also carry a quart of cylinder oil along. Sometimes I forget that, too. But one is more apt to watch oil than gas. Or possibly you know how much you have but go further than you expected to with no handy filling stations to buy oil from. Then the quart of oil means the engine gets what it needs.

The gas can should have a rubber gasket around the filling hole. This will absolutely keep gasoline in. You'll never regret carrying both cans all the time.

Ohio. EARL ROGERS.

Tool for Trimming Cows' Hoofs

Kindly advise where I can get a pair of nippers for trimming cows' feet. There is a place where they make a special nipper for cattle.

Hopkins, Minn. W. P.

Not having any knowledge of special nippers for trimming cows' feet, we referred this inquiry to several men who we thought might have knowledge of such a tool if it were in existence.

The reply of all these men is that they do not know of anything of this character. They do use the same kind of nippers as are used by blacksmiths and a knife similar to that the blacksmith uses. One man writes that he has used horseshoer's nippers, saws, chisels, rasps, etc., but he has found a good paring knife to be the best tool.

The Tallest Silo

Where is the tallest silo in the world now and how many feet high?

Barton, N. J. C. D. S.

The tallest silo of which we have any knowledge is reported in a publication issued by the Portland Cement Association, which contains a report of a concrete silo 108 ft. high that was built on a farm at Saloma, Pennsylvania. We have occasionally had reports of silos up to 60 ft. in height but it is unusual to have them any taller than this. A silo taller than 60 ft. complicates the process of filling and can scarcely be considered economical except under very unusual conditions.

Fall Plowing Clover for Sugar Beets

HOARD'S DAIRYMAN:—A reasonably large crop of sugar beets cannot be grown on a field unless there is a sufficient quantity of available plant food and the necessary humus in the soil for plant growth. The green mass of clover when plowed under furnishes food for myriads of soil bacteria. These bacteria will work over this material and together with other soil action will bring about decay of the green mass. It is through this action that nitrogen, phosphoric acid, and potash are set free—the foods so essential for the best growth of plants.

The green mass, too, when plowed under will serve the soil considerable moisture and act in the capacity of a sponge. It will retain moisture in addition to the plant food which it affords. Since sugar beets contain about 87 per cent water, it will be seen the great need for moisture that this crop has. With the plant, it is just as with the animal. It needs to keep on growing continuously from the time it is planted to maturity. Any obstacle that may enter, such as the need for food, for moisture, for warmth, for attention to fungus and insect attacks during the growth of the plant will be sufficient cause to bring about material reduction in the yield of the crop.

The need for humus in the soil may be determined in the field by noting the baking, cracking, and packing condition of the soil. In worn out soils it takes a long time to replace humus properly. Rotation of crops in which clover should always be a member should be planned carefully so as to maintain the soil in high state of fertility.

Frequently from two to three tons of green crop of clover is plowed under per acre. This produces an enormous mass of lumifying material and, together with the application of a ton to a ton and a half of air-slacked lime to the acre, applied to plowed ground before planting, will give excellent results in the growing of sugar beets. The green crop when plowed under should be placed as deep down in the soil as possible. It is practically an easy matter to work up material from the bottom of the plow furrow, when once it is placed there. The deeper the crop is put down the greater is the body of the soil which is benefited physically and chemically, from the green manure crop.

Wisconsin College of Agriculture. J. F. WOJTA.

Cleaning Test Bottles

My milk test bottles have a brown coating inside and I am writing to ask you how it can be removed.

Oakland, Md. G. D. S.

In running the Babcock test the bottles are most easily cleaned if they are shaken and emptied while hot, immediately after reading the test. There is usually a quantity of white mineral matter, consisting largely of calcium sulphate, in the bottom of the bottle and if the bottle is inverted and shaken hard while the contents are running out, this mineral will be washed out with the liquid contents. If not shaken, the mineral matter remains in the bottle and is more difficult to remove afterward.

This can be most easily done by pouring into the bottles some ordinary muriatic acid such as the tinsmith uses in soldering. This will dissolve and loosen the mineral matter in a little time.

After test bottles are freed from mineral matter in this way it is sometimes seen that they contain some brown material adhering to the glass which is not dissolved in acids, but which can be dissolved in alkali. That test bottles may be perfectly clean, we always recommend that after the acid is shaken out they should be dipped into a pail of hot soapy wash water, filled with this liquid, and emptied two are three times. If necessary a small brush may be pushed down the neck and revolved inside the bottle to remove any hard, solid particles. The bottles are finally rinsed in clean water and are then in perfect condition for use. Most any kind of good washing powder or salsoda can be used instead of soap, as most of these powders contain more or less alkali.

Wisconsin College of Agriculture.

Damages for Breachy Bull

A owns a herd of cattle which he values quite highly and which he is breeding up to a Guernsey herd as rapidly as possible. In this herd is a certain pure-bred Jersey which, judging by the way she is going at this time, will crowd 300 lbs. butterfat in her lactation period. A is breeding to a pure-bred Guernsey as suggested above. Fences are all good all around pasture lot in which these cows pasture.

B owns a Holstein bull, which may be a pure-bred but I am not sure either way. B's pasture lot runs along the main highway just across from A's. B's bull breaks out of his pasture and into A's pasture lot and serves the pure-bred Jersey mentioned above. From present indications, she is with calf. B's bull had been constantly breaking into A's pasture but had never done any damage before except to break down some fence.

I wish you would tell me what a reasonable amount would be to ask as damage in this case. I have written the owner of the bull informing that I would expect damage in case the cow is with calf and also that I would consult you with reference to the proper damage to ask.

S. Boardman, Mich. A. B. D.

The problem presented is difficult to handle because we are dealing wholly in futures and the resulting animal can not be considered otherwise than as a grade.

We can well appreciate that the Holstein-Jersey cross for the particular herd conditions may prove undesirable, but the selling price of the calf would, perhaps, be quite as large in the one case as in the other. We also have to consider that we are dealing in probabilities as to the sex of the calf, and inasmuch as it would have been a grade under either system of breeding, a male would be worth no more than veal prices.

Damages might be assessed at $5 to $10 or it might be more than this, but it is difficult to say whether any jury would actually grant very large damages, if any, in a case of this character. While the Holstein-Jersey cross is not a desirable one to make, yet it has occasionally resulted in a good producing animal. Possibly the best way to solve the difficulty would be to have the neighbor comply with the laws of Michigan, which, we believe, requires that he keep a bull in confinement and not allow him to run at large in the pasture.

Have any readers of Hoard's Dairyman ever collected damages in cases of this kind? If so, we would like to secure the details of the case.

Wages in New York State

HOARD'S DAIRYMAN:—Crops in the dairy districts of the state so far as I can determine are likely to be better than was thought possible only a short time ago. It is true that we hear of now and then a section where the grass crop is considerable below average but in the eastern and central where much of the fluid milk for the city comes from for the big city we have production fully up to the average. Nor is there the shortage of help that was thought likely at an earlier date. We have very little so far as I know of the city help that was suggested, and while wages are high, too high for real profit I think, we are not paying what is reported in many of the papers.

It would still be difficult to state just what wages for haying really are. We get statements of a dollar an hour but cannot find any such cases. Six to seven dollars a day were contended for and are still in reports and statements, but on following these up it is difficult to locate them. I found one case where sixty cents an hour was paid and for one or two days there were twelve or more hours put in. This is different, however, from a regular wage of seven dollars a day. By the day it seems to me that five dollars is about as high as we can state and many are working for less. Where relatives or acquaintances are helping the wages are not always the first factor, and these cases count quite a proportion.

In addition to this we find among these classes that hay is handled sometimes on the old-fashioned plan. That means getting in six to ten loads in a day instead of the usual three or four that we have had to do for some years with the ordinary hired man such as we have been employing. It is true that many farmers have still to depend on the usual hired man if he can be found, but sometimes he cannot be had and as intimated, friends sometimes come along and try to help out for the accommodation of the thing. It is these cases where men want to help and make the time as short as may be that things are put through more swiftly than the usual run of help can do. It is serious business all the same and is not for those physically unfit for a big job in a short time. Yet I think that farmers are getting out of the situation better than we thought possible at one time.

With the average dairy farmer in my section fairly supplied with hay and forage crops he next considers the feed situation. Some are already buying part of their feeds, not so much this time because they feel sure that feeds have reached their lowest, as to make sure of feeds at any price. Business men tell us that they are seeing no improvement in the railroad situation, in fact some say it seems to be getting worse. I do not know how much ground there is for the feeling but some who have a good chance to know say that it is the employees more than cars or rates that keep the roads throttled. There is no doubt that many of the employees want the government to operate the roads again and they are thought by some to be using tactics of obstruction and destruction to register their wishes. Of course that is not true in all cases but it looks as though there may be enough of it to cause apprehension on the part of business men and farmers.

Some of the recent declines in feeds, however, are significant and under other conditions dairymen might well be justified in delaying to buy some of their supplies. The G-L-F Exchange is certainly likely to be a factor in helping out local farmers in New York and nearby territory. None of the things that are being done can release the dairyman from looking ahead for his own safety and causing him to stock up on suppiles as soon as he can see a good reason for that course.

There is a real feeling that milk prices must be fairly good until spring at least. Should some condition cause an unprofitable price in the winter it will bring surprise to the average farmer. Help is not going to be flush even in winter from present prospects. I saw a small manufacturer yesterday who complained that his help is leaving him because big competitors pay more. A neighboring concern had just donated a week's pay extra and farmers are paying for harvesting more than he could pay. This is the first complaint that I have heard for the farmers on the wage scale. After harvesting farmers will seldom pay wages that will interfere with manufacturers getting help.

Decline in Grain Ends

Week Makes History in Grain Markets—Heavy Recent Decline Half Recovered

The week ending August 7 made history in the grain markets. On Monday, the decline that started some two weeks earlier ran its course, and a reaction began on Tuesday. The decline would have been phenomenal even during the war markets. Chicago December wheat which opened on July 15 at $2.72 to $2.75, sold at $2.06½ on Monday, August 2, a decline of approximately 67 cents. In the same period, Minneapolis December wheat declined 66 cents to $2.07, and Kansas City 63½ cents to $2.05½. Yet by Friday, August 6, Chicago had advanced to $2.48, Minneapolis to $2.42, and Kansas City to $2.36. Thus, approximately one-half of the decline was recovered in less than a week. In the corn market, the December future declined 17 cents in the two weeks' period, selling at $1.19½ on the 2nd, and reacting to $1.31¾ on the 6th.

During the big decline, there were many reports of a heavy movement of grain from first hands, and a desire on the part of country buyers to ship grain, particularly wheat, in large volume, and it was said that only the lack of cars prevented the terminal markets from being flooded. Unquestionably there was a free movement of wheat in the Southwest, particularly toward the Gulf ports. Yet, cash wheat in all markets commanded good premiums over the December future, which was hardly consistent with the reports of the heavy movement. In fact, the heavy movement never materialized at the terminal markets, and the premiums on cash wheat were well maintained.—U. S. Bureau of Markets.

Free Cheese and Butter at State Fair

Dairy and Food Commissioner Behind Novel Scheme to Advertise Wisconsin's Dairy Products

Of vital interest to every butter and cheese producer in Wisconsin is the plan of Dairy and Food Commissioner George J. Weigle, for advertising these products at the State Fair next month. Samples of Wisconsin butter and cheese donated for that purpose by manufacturers and dealers throughout the state are to be distributed free on four afternoons of Fair week, so that the people of the state may learn what two of their most important home products taste like and so that their interest in these products may be stimulated. Only high quality cheese and butter will be used in the demonstration.

"Many of our citizens are not cheese eaters," said Mr. Weigle when discussing his plans," "and by means of this demonstration we confidently expect to awaken the interest of such people and make consumers out of the majority of them. There are also many who do not realize how much better a really good, high scoring butter is than the product which they buy as just "butter". We will accept for distribution no cheese or butter which does not score 93 or better so the public will be assured of getting a sample of high grade goods."

The plans for this unusual advertising scheme are being worked out by Mr. Weigle in co-operation with the Wisconsin Dairy Council. There will be a booth in the dairy building attractively decorated in white and each afternoon from Tuesday to Friday between the hours of 2:00 and 5:00 o'clock white-capped and white-gowned young ladies will distribute to all comers dainty squares of cheese and butter served on crisp soda wafers. On one day Swiss cheese will be featured; on another day Brick will be given away; while on the other two days American cheese will be distributed. Samples of butter will be distributed on all four days. Each person receiving one of these samples will also be given a neat card prepared by the Dairy Council showing the high food values of butter and cheese as compared with other foods and containing arguments for the increased consumption of dairy products.

The Robt. A. Johnson Co. of Milwaukee has donated the supply of crackers for the entire demonstration, and already considerable amounts of cheese and butter have been promised. According to Mr. Weigle several concerns wanted to provide the entire lot of cheese and butter to be given away but this was not in accordance with the plans made. "We want these dairy products to be representative of the entire state," Mr. Weigle said, "and we wish every manufacturer of a high grade cheese or butter to have a chance to participate in what we feel is one of the biggest opportunities ever offered to boost the dairy industry of Wisconsin. We expect to give away at least 200 lbs. of butter and 500 lbs. of cheese and public credit will be given for every cheese and lot of butter accepted. So far there have been only three men to whom the matter has been presented who have not been eager to donate some of their product."

Anyone desiring to assist in this plan for increasing the consumption of Wisconsin's dairy products by contributing either cheese or butter should communicate with Geo. J. Weigle, Dairy and Food Commissioner, Madison, or should send the cheese or butter to the Dairy Building, State Fair Park, West Allis, Wis., in the same manner as an exhibit but plainly marked "For Free Distribution" so that it will not be confused with exhibits sent in for prize competition.

Milk Making Efficiency

One needs only to watch the milk coming into any milk plant in the city to tell which farms are run as a business or which farms let the business run them. Efficiency can and should be introduced into everything we do. There is no place where the results will show more clearly than on a farm. Let us look over a few of the chances for introducing efficiency.

First, we will turn to the stable. Has your stable at least one square foot of window glass per stanchion? Sunlight, you know, is the most efficient germ killer. Have you whitewashed the stable this year, especially the ceiling? Do you know that dust, spider webs, etc., will not collect on the ceiling half as quickly if it is whitewashed? Is the manure pile in front of the barn door placed so the cattle must walk through it and thus get their legs and udders dirty when coming into the stable? Does your milk can stand in the stable during milking where the milk may absorb the cowy and barny odors? Are you using a small-top milk pail? These are all minor details, you may say. Certainly they are. It is the small details combined which make the large results.

Are you efficient in your efforts at cooling the milk? How do you know unless you have a thermometor? Isn't it efficient to purchase and use a dollar thermometer and thereby save a couple of cans of milk from becoming sour or condemned?

Are you spending an extra half hour each day trying to cool your milk in a wash tub when that time can be saved by installing an efficient tank or aerator cooling system? Do you realize that an aerator will pay for itself in time saved in about a month and a half?

Let us look into the milk straining proposition. Are you still among that class of milk producers who think that by straining out the dirt from milk the quality is as good as it was before the dirt entered it? If you are, you are about one generation behind the times. Remove the cause and you will stop the effect. Make your efforts count. Clean the cow's udder and flanks with a damp cloth before milking and remove the greatest source of milk contamination.

Do you allow the milk to stand in the sun without protection for an hour or more, waiting for the milk hauler? Experiments have shown that milk will heat up only half as much when protected by a wet blanket or sack as when left exposed to the sun. —Flint, Michigan, Health Department.

National Dairy Union

This is to certify I have today (August 13, 1920) audited the books for George Caven, treasurer of the National Dairy Union, and find the receipts from July 1, 1920, to July 31, 1920, to be $128.67, and the amount paid out for which he holds vouchesr, the sum of $330.75, leaving a balance on hand August 1, 1920, of $4,193.14. F. P. COLLYER, Auditor.

May 17, 1921—Holsteins. Wisconsin Holstein Breeders' Sale, West Allis, Wis.

Price Decline in Feeding Stuffs Gathers Momentum

Break Largely Due to Improvement of Transportation Conditions and Augmented Supplies

The principal feeding stuffs recorded further declines during the week ending August 7. Wheat bran which sold July 31 in Minneapolis at $43 was quoted at $39 on August 7. Soft winter wheat bran was offered on the same date in Memphis at $43 with buyers holding off. Season bran was quoted at around $44 delivered Baltimore with country trade buying sparingly. Freer production of feeds and the arrival of delayed cars, augmenting supplies on the spot, caused lower prices in all markets. The transportation situation is reported as much improved. A spirit of conservatism still prevails in spite of rumors with reference to European complications.

Wheat and Mill Feeds.—The demand for standard middlings for hog feed is good. While the price of this commodity declined from $1 to $2 per ton, it is still selling at from $10 to $12 per ton over bran. Formerly its average price was slightly $2 higher than bran. Practically all markets report declines from $4 to $5 in the price of bran. Reductions of $2 per ton overnight were not unusual. The official price on soft western winter wheat bran is 100-lb. sacks in the Philadelphia market on August 4 was $53 to $53.50, on August 5, $51 to $51.50. Stocks of wheat feeds are good.

Buffalo and Minneapolis report large stocks of bran and fair stocks of middlings. Market is stagnant and no immediate improvement is expected. September shipment of middlings can be bought in many markets at $7 per ton less than track stuff.

Cotton Report Affects Meal Prices

Cottonseed meal.—A continued improvement in the condition of the cotton crop on July 25 resulted in a further easing off of prices. First shipments of new meal from central and southern Texas are expected the last part of this month. New crop 43 per cent meal is quoted at $53 f. o. b. Texas common points. Sterling exchange declined during the week to $3.55¼ and no resumption of export business to any extent is expected in the near future. Southern markets report stocks as good and the demand poor. Trading in new meal is said to be mostly of a speculative character. The movement was light.

Linseed Meal.—The price of linseed meal remained practically unchanged. Mills in Minneapolis territory report that they are receiving shipping instructions in large numbers since the date of rate increase was formally announced. The eastern demand is quiet. Shipping is fairly heavy on August contracts. Stocks in manufacturing centers are large. Northwestern mills report the market as dull and that the recent decline in the seed market has had a bearish effect on country trade which is holding off expecting lower prices.

Alfalfa Meal.—The demand for alfalfa meal is quiet. Kansas City reports that Colorado mills are quoting No. 1 meal at $34.50 f. o. b. Kansas City, which is a lower price than that quoted by the local mills. Offerings in the principal markets are liberal. In northeastern territory Colorado No. 1 meal is quoted around $45 prompt shipment delivered Philadelphia rate points, and August—September shipment at $43.50. The movement is heavy.

Gluten Feed.—Gluten feed manufacturers report prices unchanged from last week and that plants are being operated full capacity. Orders are said to have slackened up a little. Supplies of corn seem to be more easily obtainable. Stocks of corn in this country reported at 7,029,000 bushels compared to 3,200,000 bushels a year ago. Offerings for August shipment are good, stocks and movement fair.

Hominy Feed.—Chicago jobbers quote hominy feed at $60 f. o. b. Chicago, with small demand from country points. Kansas City and a few other markets report lower quotations than prevailed last week. but the larger mills advise that the strength in cash corn necessitated a slight advance. They state, however, that the demand is mostly for immediate shipment, as buyers seem anxious to avoid payment of higher freight rates due on or about August 26.

Other Feeds.—Los Angeles wires that beet pulp for 10 days shipment is quoted at $55. Price of the imported material in eastern markets declined from $1 to $2 per ton. Mixed feed in northeastern markets is easier. The price is about $66 in San Francisco, Los Angeles, and Seattle, and the supply appears equal to the demand. Barley feed is quoted at $60 in Denver and rolled barley ot $56 in Los Angeles.—U. S. Bureau of Markets.

MARTHA'S MAJESTY, JERSEY HEIFER OWNED BY J. E. SIMMONS, JR., ILLINOIS
Starting her test at 22 months of age, she produced in 10 months 6,209 lbs. milk, 374.4 lbs. fat. She is a granddaughter of Royal Majesty.

New York Butter Market

NEW YORK CITY, AUGUST 17:—As is usual at this time of the year, the quality of butter being received at the present time is, on the whole, poorer than that received during the past two or three months. That condition is resulting in an under supply of high quality butter and an over supply of undergrades. In consequence, quotations on fancy butter are gradually advancing and the range of quotations on undergrades is correspondingly widening. At the present time, there is a strong active demand for extras and higher scoring butter and but medium demand for all lower scoring butter. That condition almost invariably prevails during the month of August and continues until cooler weather in the fall when production gradually begins to increase because of the usual freshening of cows in early fall. Production has held up remarkably well this summer and, taking all things into consideration, buying has continued active the greater part of the summer. Had it not been for the influx of the large quantity of foreign butter at one time, an exceptionally active market would have obtained throughout the summer.

During the past week or ten days, the market has gradually been gaining in strength. At one time, about two weeks ago, it seemed that a marked decline of butter prices must result. However, out-of-town buyers became active purchasers of large quantities of high quality butter and, as a result, a greater confidence in the market quickly became apparent. Since one week ago Monday, the total increase in the quotation on extras has been 1½c. The advance, however, is no indicator of the difference in feeling in the market. From extreme pessimism, the feeling has become one of great optimism.

One week ago Saturday, extras were quoted at 54c. On the following Monday, the out-of-town buyers began to arrive and local buyers became active. On that day, the quotation advanced ¼@½c. There was no change on Tuesday, but on Wednesday there were additional gains of ¾@½c. The market was firm and active throughout the balance of the week, but there was no change in quotation except an advance of ¼c on Friday. Yesterday, the week opened with considerable activity and the price again advanced ¼c. Today has seen no change in general conditions, nor in prices, and the market can be said to be firm and active. It invariably pleases receivers of butter when price advances are fairly constant but small. It indicates that no unusual factors are at work but that the advances are due to healthy normal conditions. It always reduces nervousness to the minimum with the result that jobbers become large buyers as they feel little risk in accumulating considerable stocks of butter. Established quotations are: Extras (92 score), 55¼@55½c; higher scoring than extras (93 score or higher), 56@56½c: firsts (90—91 score), 53@54¾c; firsts (88—89 score), 51@52½c; and, seconds (83—87 score), 48½@50c.

Immediately after the large shipment of Danish butter was received, reports from Denmark indicated that practically no more butter would be received from that country. However, small shipments are being received each week. While such shipments have little influence on the market, they are factors which must be considered. It is expected that an additional 4,600 casks of Danish butter will reach this port this week. No additional shipments of Holland butter have been reported but some Argentine butter is said to be on the water headed for this port at present. While Canadian butter is a factor which has little influence on this market, considerable of it is being received each week. It is very doubtful if it becomes a factor of any consequence as the greater part of the Canadian output is being consumed at home and in Great Britain.

W. B. LIVERANCE.

"No Flies On Me"

Twenty-Four Hour Protection

COWS will not produce large quantities of milk unless they are allowed to feed in peace and contentment. Flies torture them and when cows are not protected from these great enemies, they cannot yield the maximum quantity of good milk and butterfat. A single spraying of

KOW-PROTECTO
KEEPS FLIES OFF

not only at milking time, but for 24 hours. By spraying just once a day, you save a lot of time; protect the vitality of your cows and increase your profits through the bigger flow of milk. It is absolutely harmless and cannot taint milk or blister skin, yet flies cannot live where this liquid is exposed or applied, in pens, stables, yards, manure pits, etc.

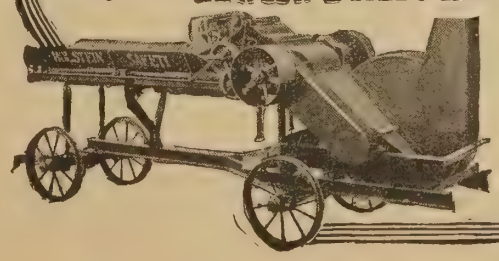
A New Fly Repellant For Stock

Safe, sure economical—non-poisonous, no odor, easily applied. Made at home from commonly used household supplies. Also safe, sure fly poison absolutely guaranteed or your money back. Send $1.00 for both recipes.

George E. Hardin, Lock Box 6, Weiser, Idaho



Direct Driven Blower

In the Holstein method of driving, the sprocket is connected direct to the pulley, securing the advantage of uninterrupted drive of blower should cutter head be thrown out of action by safety-stop device.

Hence the blower continues to operate after the knives stop, thoroughly emptying the spout and fan chamber of all cut silage. This eliminates the annoyance of opening up and cleaning out the blower before starting up again as is necessary with ordinary blowers.

There Are Many Other Reasons
Why the HOLSTEIN SAFETY is Superior

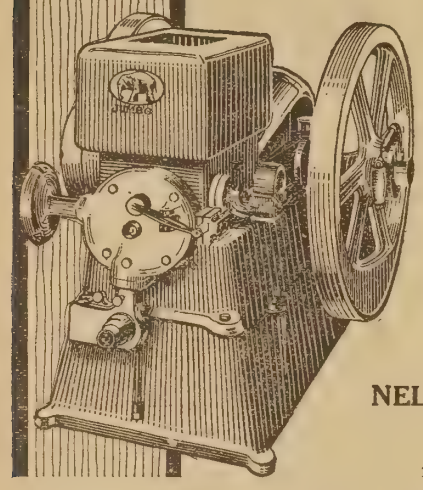
JUMBO FARM ENGINES

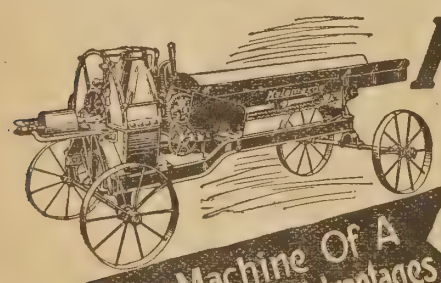
Jumbo Oversize Valves Reduce Carbon



Carbon forms when the cylinder walls and head of an engine become hot enough to burn the lubricating oil.

Jumbo Engines have oversize exhaust valves—burned gas escapes quickly and less heat is absorbed by the metal, thus helping the adequate Jumbo cooling system to prevent overheating and the resulting carbon formation.

Unusually large intake valves insure a full charge of fuel.



More than 100,000 Jumbo Engines are in use—they *must* give satisfaction. Sold through dealers who make it their business to help you get unusual service.

Positive ignition — Webster Oscillating Magneto—and a Special Mixer, insuring uniform fuel, make it easy to start Jumbo Engines quickly in any weather.

The Jumbo Farm Engine book will mean money to you. Write for it.

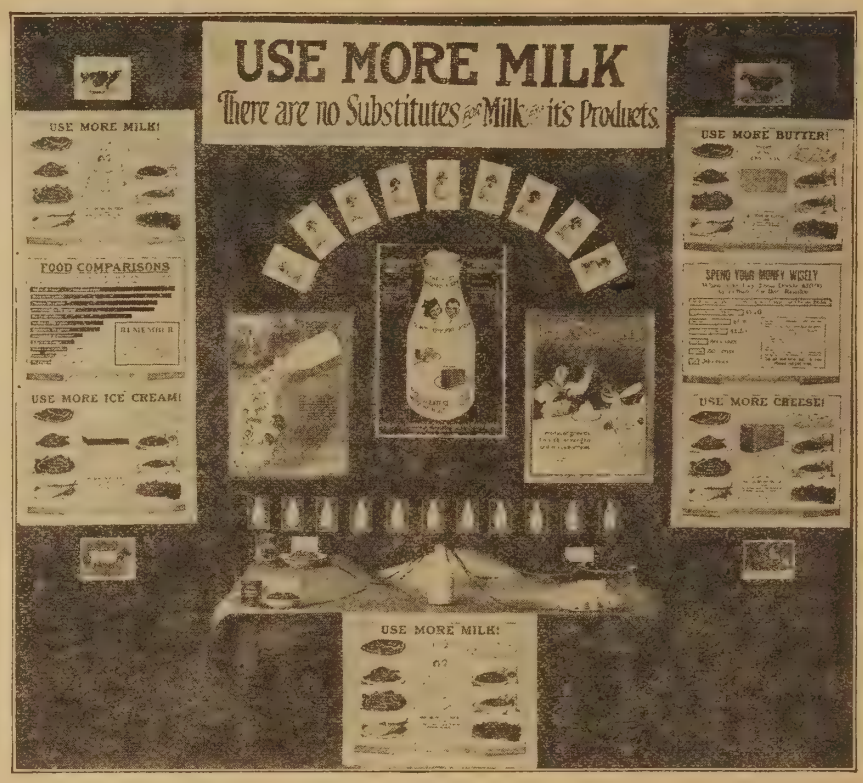
Dairy Exhibits at County Fairs

THE greatest need of the dairy industry is consistent advertising and publicity. As a result two customers will be created where there is now but one, and each will be made to feel that dairy products are indispensable foods—nourishing, healthful, and economical. This will mean better health, increased efficiency, and a saving of money on the part of the consumer, and increased profits for those engaged in this industry.

There are many ways of advertising, one of which is by exhibiting at local, county, state, and national fairs. Every man engaged in the dairy industry should see to it that the products of this vital industry are advertised continually before the public. The public should be continually reminded of the importance and economy of dairy products. Every opportunity should be used by dairymen and representatives of dairymen to call the public's attention to these fundamental foods.

The accompanying picture illustrates a suggestive dairy booth for fairs which can be quickly and conveniently prepared. The National Dairy Council, 910 So. Michigan Ave., Chicago, is prepared to supply the material for the booth shown herewith to any persons desiring it.

County Agents will find this material ideal for their use. The exhibit is unusually attractive. All the posters, except two, are in colors. The National Dairy Council supplies everything except the foods shown on the table.



The exhibit is simple and easy to handle. It can be made elaborate if desired, however. A counter can be arranged, and other features can be added, but the idea of the National Dairy Council is to feature a simple, inexpensive, yet attractive booth which can be prepared and used in tents, sheds, or outdoors if necessary, as well as at regular fairs. A few pins, small nails or thumb-tacks, together with a background, is all that is required in order to get this booth under way. The exhibit requires a space 10 feet wide. The height can be varied, depending on conditions.

This material is now all ready for use. It will be sent to any one requesting the same, upon receipt of $2 to partially cover cost of preparation, wrapping, and postage.

If you are interested in seeing dairy products advertised, in seeing that the public is educated to a greater use of your products, get busy and get this exhibit now or have your county agent get it and display it at all fairs and conventions in your county. It can be ordered through your State Dairy Council or direct from the National.

Begin today to think seriously of your business. Advertising is essential. The facts about milk and its products must be told to the public or your harvest will be light. Support your State Dairy Council.

NATIONAL DAIRY COUNCIL.

Dead Seed Ears Are Expensive

HOARD'S DAIRYMAN:—The corn crop of 1921 will be determined in no small measure by the care used in harvesting and storing the seed ears to be selected from the crop that is now standing in the fields. Although few farmers realize fully what a losing proposition it is to plant untested corn, fewer yet realize how important to good germination is the care that seed corn should receive. It is not unusual in driving through the country to see a row or two of seed corn hanging under the eaves on the outside of some barn or other building. Safe it is, to be sure, from rats and mice, but these constitute by no means the only menace to corn that is being saved for seed. Injury done by freezing when the ear contains more than about 14 per cent of moisture renders it powerless to bring forth of its kind. The life germ contained in each fertile kernel will retain its vitality under considerable extremes of temperature if excess moisture is eliminated, but to leave seed ears exposed on the side of a building is to subject them to conditions which must result necessarily in disappointing germination.

Dead seed ears constitute the most expensive corn that is handled on our farms. A single ear means a loss of several bushels of corn the succeeding season. To secure good

seed corn that will give a high germinating test it is necessary that proper care be given it from the very moment that it is selected in the field. This is something that experienced seed corn men are not slow to emphasize. Ordinarily it is not unusual for farmers to go through their fields and select good ears, bring them in from the field and spread them out in some place to await a convenient season for putting them away, either on the racks or hangers. Such a method will almost always, according to one man long in the business, result in corn of uncertain germinating power. Freshly snapped corn contains a great amount of moisture. At the moment it is broken from the stalk its life processes cease. Elimination, by artificial means, of the moisture which Nature no longer is able to remove through the ripening process must begin at once. To this end it should be put up to dry the same day that it is picked. Even though spread out on the floor for a few days, this initial drying will not go on fast enough to give the best results.

It is not alone necessary to eliminate surplus moisture out seed corn must be kept in its dry condition until planting time. This is essential to high germination. When corn is thoroughly dry, freezing will not make any material difference in its power to germinate but corn that is left in the crib, or that is subject to the dampness incident to fall or winter weather, will suffer severely in case a sudden cold snap catches it before it is thoroughly cured. With cribbed corn it is almost certain to happen several times during the winter that a sudden drop in temperature will follow a period of warmish weather with high humidity. The cribbed article takes on a certain amount of moisture and the freeze up that follows takes toll of the life germ in many kernels simply because of the excess moisture present. Repeated tests have shown that cribbed corn is a most uncertain article for seed purposes.

In most climates a special drying room or house will well repay for the cost it may necessitate. Where this is not practical an unused room in the house, or even the attic, may be called into service. Storage of this kind is objectionable, however, because of the extra labor, the litter and the mice which will be drawn into the house by the presence of so much corn. A special mouse-proof room in the barn is the best and least expensive solution in many cases. Any room of this sort can be made mouse-proof by lining it with a cheap grade of wire screening such as is used on windows and doors. A small stove for use as the season advances to keep up the drying during periods of damp, wet weather is necesssary. The risk of fire should be held in mind. For this reason the separate, isolated structure is to be preferred.

The means of racking seed corn are various. There is little choice between them so far as effectiveness is concerned. The chief thing is to keep the ears sufficiently separated to permit good circulation of air on all sides and to minimize labor both in the way of storing the ears and in the matter of making the germinating tests. The several forms of wire drying racks are effective, but where several hundred of them have to be purchased the cost figures to a snug sum. Posts and 2x4's, well studded with large finishing nails or nails from which the heads have been clipped, can be made to answer at slight expense. When testing large numbers of ears, the large "pigeon hole" rack —either of wood or wire—will no doubt lend itself to rapidity of work and accuracy. With them there is little extra handling and but slight chance of confusion.

Seed corn will dry out very largely without artificial heat if ventilation is good. Late in the fall it becomes necessary to resort to a low fire, particularly in the northern states where the autumn is hardly long enough to complete the drying. With a variable climate—wet one week and cold the next—the low fire is also necessary much of the winter. A temperature of 40 degrees in the drying room or house is sufficient to ward off danger.

Illinois. ORIN CROOKER.

A Progressive Convert

"Monroe County (Wis.) has a farmer who less than a year ago ridiculed scientific farming and dairying and called the agricultural graduate a stand-up-collar dude. Four months ago this man joined a cow testing association and to date has replaced fifteen of his seventeen scrub cows with high grades and a registered bull with a pedigree a yard long. Just a matter of letting in the light."

Lye solution will kill mites in the hen house, and sodium fluorid gets the lice.

You Need This Equipment Now More Than Ever Before

JOHN DEERE MOLINE, ILL. THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

Select the type of John Deere Elevator you require and order now. The shortage of labor has caused a shortage of labor-saving equipment. To delay ordering may mean disappointment. See your John Deere dealer at your first opportunity. He will help you in selecting the equipment and size to meet your needs.

Also write for our big free elevator booklet that fully illustrates and describes the full line of John Deere Elevators. Write to John Deere, Moline, Ill., and ask for Booklet EL-514.

You are confronted with labor-shortage. Labor that you can get is high-priced. Labor-saving equipment right now is more important to you than ever before. It will help solve your harvest-time problem.

The John Deere Elevator is labor- and time-saving equipment that you need this harvest. It elevates faster than the biggest thresher can deliver the grain. It does away with the extra shovelers ordinarily required to empty the grain wagons.

The John Deere Elevator elevates faster than the biggest corn-husking crew can bring in the corn. It saves hours of time for corn-picking because it does away with scooping entirely.

Besides, this elevator saves all that back-breaking work of shoveling.

The John Deere Elevator elevates the biggest load in from three to five minutes, delivering all of the grain or corn where you want it—no waste. A team of horses or a three to six-horse-power farm engine furnishes ample power.

JOHN DEERE GRAIN ELEVATORS

FURNISHED IN TWO TYPES

JOHN DEERE PORTABLE STEEL ELEVATOR—for farm use where elevator must be moved from one crib or bin to another. Steel construction—will not warp or decay. Each section trussed and thoroughly braced—no sagging.

Head and boot shafts run on roller bearings. Light draft and quiet running. Special overhead dump stops automatically and lowers instantly by gravity; controlled by friction brake.

JOHN DEERE INSIDE CUP ELEVATOR—the type for permanent installation in building where entire grain crop is stored. Easy to install—always ready for use. Roller bearings lighten the draft. Delivers grain to any point in building. Will last for years.

JOHN DEERE

JOHN DEERE MOLINE, ILL.

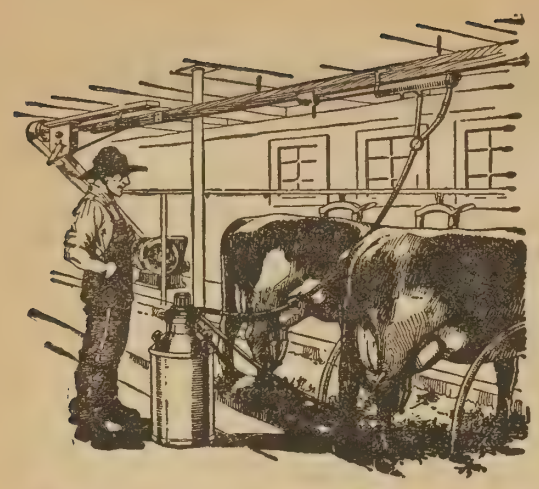
THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

Drain Before Winter Rains

Get ready for ditching and terracing your farm NOW. Don't delay. Water standing on your land during the winter will smother the soil, kills big crop chances for next year. You can solve the open ditch or tile ditch problem **at low cost.** You can make sure that your land will be in finest condition for early spring work. Seed will germinate much quicker and be healthier n well-drained soil. Write for new book that tells how to do it with

Model 20

THE Martin O.D.&G.CO. PATENTED **FARM DITCHER Terracer & Grader**



All-steel, reversible, lasts a lifetime. Cuts V-shaped farm ditch, open drain, tile or irrigation, down to 4 ft. deep; cleans old ditches; grades roads; builds farm terraces, dikes and levees; works in any soil, wet or dry. 2, 4 and 6 horse sizes; large size fine for tractor. Does work of 100 men. Solves all dirt-moving problems. Write and find out how to make big crops sure. New, free book on drainage, irrigation and terracing. Address

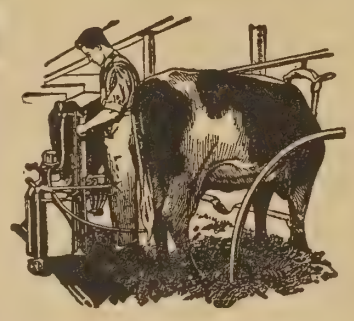
Power Milker

Electric Motor or Gas Engine Drive

For herds of twelve cows and up. A simple, superior milker at *a great saving in price.* The greatest simplicity, the greatest ease of operation, the greatest durability—and still, an outfit for sixteen cows costs only

$210



PAGE MILKER

Simple—Durable—Economical

No pipes, no tanks, no pulsators. No expensive installation. Milk flows into valveless glass chamber *in plain sight;* you see just how the cows are milking. Simple teat cups—no rubber lining. Patented air control gives perfect natural release to cows' teats, at last! No special pails. You milk into your own ordinary milk can. The Page is the only milker with these and other features of simplicity, economy and easy operation.

Hand Milker $123

At last a milker for the farmer with six to twelve cows. *Run by hand.* One-fourth the work of hand milking. A child can operate it. Does the work on small herds just as the most expensive power outfit does on very large herds. A superior milker, too. *No installation expense.* Even if you need engine power, here is a chance for you to find out at small cost what machine milking can do for you.

Try It!

Send for free catalog and information about the Page Milker. Get the *facts* about all milking machines; how to get the most milking service at least cost. *Arrange to have a demonstration on your own herd*—try it yourself—you can try a Page Hand Power milker without installation—see what the Page Milker can do in solving your labor problems and taking the drudgery out of milking. No extra cost of any kind. Write for free catalog and full information today.

BURTON PAGE CO., Dept. C962 9 South Clinton St., Chicago, Ill.

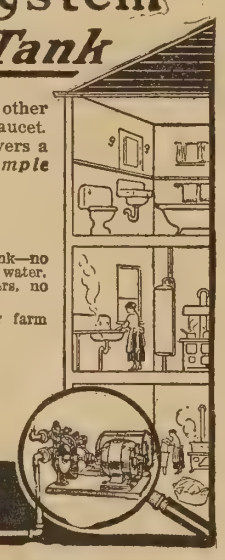
A Water System *Without a Tank*

Draw water direct from the well or other source of supply at a turn of the faucet. Open the faucet and the pump delivers a steady stream of water *under ample pressure.* Close the faucet and the pump stops. All done by the

WESTCO

Tankless Water System

—the lowest priced, automatic, power water system. Has no storage tank—no tank to leak, freeze, rot, rust, overflow or collapse. No stale, stagnant water. The WESTCO Pump has only one moving part—no belts, no valves, no gears, no springs, no oiling.



The WESTCO System can be run off the regular electric light circuit or farm lighting plant. Thousands are in daily, successful operation.

Send today for our bulletin C-4, which tells the story.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, AUGUST 16:—The decision of the Interstate Commerce Commission to grant the rate increase asked for by the express companies, has its angle which hits the dairy business. The recent freight increase decision hit the dairy industry much harder. Both decisions raised the question very sharply as to the wisdom of present methods of fixing milk and cream prices on the basis of shipper paying transportaion charges. The express rate increase authorized by the I. C. C. on August 14, amounts to 12½ per cent. This, it is estimated, will increase express companies revenues by 35½ million dollars. The I. C. C. specifically states that in making this award it has not taken into account the recent wage increase granted express company employees. This presages another rate increase in the near future.

⚜

Figures are available this week at the office of the Dairy Division giving the total production of renovated buttre in the United States for the year ending June 30, 1920. The figures, compared with 1919 figures are of unusual interest. The 1919-20 total of renovated butter, 12 months ending June 30, was 9,641,675 lbs., a decrease of 7,026,780 lbs. below the totals of the 12 months ending June 30, 1919. This is a decrease of 58 per cent. The production of renovated butter in this country has shown a steady decline for several years, but this year's reduction is much greater than heretofore. It indicates a trend in the industry which is of economic value, for the large amounts of renovated butter made and sold in past years were an index of the large amount of butter which for various reasons reached market in an unsalable condition, whether one cause or another, and therefore had to be reclaimed. The decreasing amount seems to indicate two things: first, better methods in both farm and creamery methods—chiefly farm, probably; and second, the extension of the more economic practice of the sale of cream at the dairy to central gathering stations, rather than the home manufacture of butter, with all its attendant liabilities of fluctuating quality and non-standard packages.

⚜

T. E. McLaughlin, manager for the Maryland—Virginia Milk Producers' Association, reports the work of completing the marketing organization here as going steadily forward, with little difficulty except the delay incident to covering the big territory. There are no further indications of activity in the threatened anti-trust suit, a local newspaper putting it this way, "If the department of justice has taken any cognizance of this complaint, their activities are shrouded in secrecy."

⚜

G. P. Warber, secretary for the National Milk Producers' Federation, is back in Washington, after a trip through the Central South visiting the milk producers in Tennessee and Kentucky. He is now making plans for a meeting of the board of directors of the National Association, to be held at Columbus, Ohio, at the time of the National Board of Farm Organizations marketing conference there the first days in September. Mr. Warber is watching closely the New Orleans case against the milk producers there charged with a conspiracy in restraint of trade, and is also in touch with the situation which has developed here by the activity of the Washington city milk distributors petition to the attorney general for action against the Maryland—Virginia producers. Mr. Warber expects that the Milk Producers' Federation will take an active part this winter in legislation affecting co-operative marketing, and various other legislation especially affecting dairy products.

⚜

The National Society of Record Associations' activity in support of the McFadden Rural Credits bill and demanding that the special committee authorized by the last Congress, to hold a judicial investigation of this subject, be appointed at once and get busy, is having a tremendous result. The Washington offices of Senator Grona, chairman of the senate committee on agriculture, and of Louis T. McFadden, chairman of the House committee on banking and currency, are being flooded with letters from dairy and beef cattle breeders, sheep, swine, and horse owners throughout the nation, asking for action. Adequate credits is recognized as one of the chief obstacles to the more rapid development of pure-bred animal industries, and these association leaders have apparently struck a popular chord in urging their members to bring pressure to bear on Congress. The committee authorized, is to consist of 12 persons, three from each of the four committees primarily interested, House and Senate committees on agriculture, and on banking and currency.

⚜

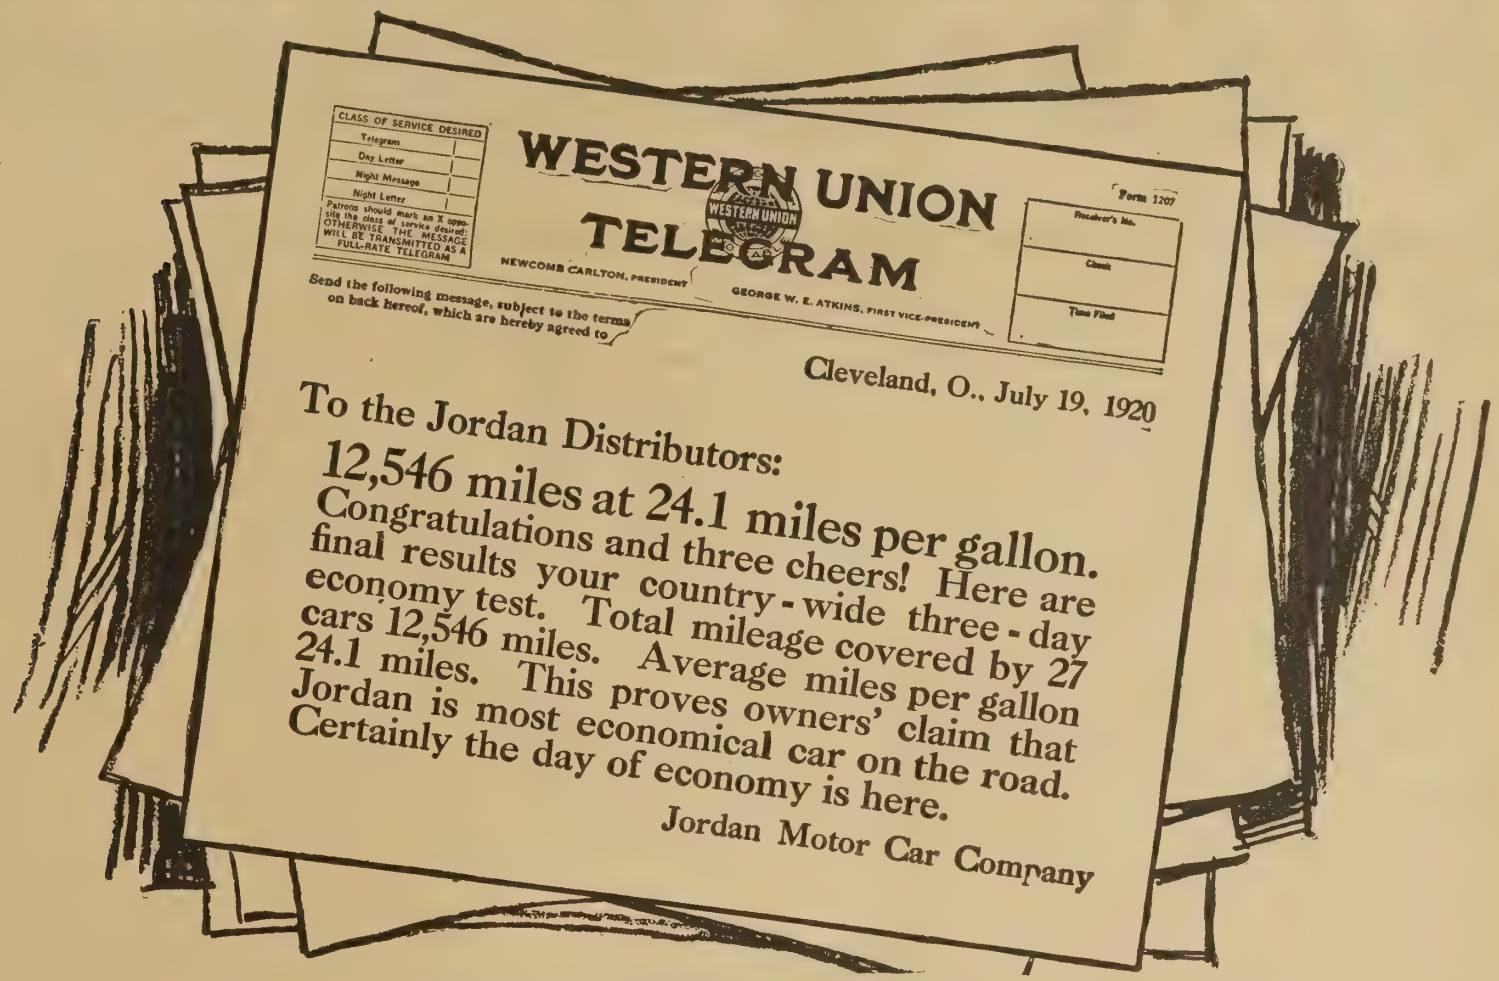
The Market Reporter indicates butter markets generally weak, with fancy butter short of market demands and trading heaviest in under grades. This with indications of a shortage of storage space, and storage movement totaling an increase in storage during the week of upwards of 3,800,000 lbs., easily explains the market condition. One Danish shipment of 1,900 casks is reported, with rumors of another large shipment enroute, still officially unconfirmed.

Tillamook County Guernsey Club's Second Sale

The eighteen head of imported Guernsey heifers which Tillamook County, Oregon, was alloted from the Peer Importation bought by the Oregon State Guernsey Club were dispersed at public sale in Tillamook City, July 9th. The average price per head for the females was $562.-89. The highest priced animal was Imp. Country Laura II, sold for $1150 to I. G. Lance. The next highest price was $750 paid by Chas. McKillip for Imp. Goosdove's Jewel.

Two Tillamook bred bulls sold, the highest priced one being Ra's Ultra King of Tillamook consigned by R. C. Jones and going to Wm. Glick for $475. This is a yearling bull whose 6 nearest dams average 500 lbs. butterfat.

Five of the purchasers obtained their first Guernseys at this sale.



Oregon. ROY C. JONES.

Jersey Cattle Notes

For week ending August 13:

Number of animals registered: Bulls, 160; cows, 490; total, 650. Number of transfers recorded: Bulls, 226; cows, 614; total, 840.

Jordan Smashes all Economy Records in Nation-wide Test—

12,546 Miles at 24.1 Miles Per Gallon

Twenty-seven stock Jordan cars in twenty-seven different sections of the United States, traveled 12,546 miles averaging 24.1 miles per gallon in a big country-wide three-day economy test.

The run was staged by Jordan distributors under the supervision of official observers, chosen by the local newspapers.

Here is how it came about. Jordan built the lightest car on the road for its wheelbase—2800 pounds—superbly balanced—1400 pounds forward —1400 pounds astern.

Jordan owners at once began making startling claims of economy.

Jordan dealers were incredulous at first. The Jordan factory waited. The owners furnished more proof.

Then the run was organized. Note in the figures listed below, taken from telegrams, the striking similarity of averages under favorable road conditions. The day of economy has dawned at last.

The hour of the light-weight, compact, high-grade, good-looking, perfectly-balanced, rattle-proof, comfortable and economical motor car is here.

Economy with distinction—describes the Jordan perfectly. That's what lifts this car with a personality so far above the mass.

JORDAN

UNIVERSAL—
Used For Official Tests o

The Perfect Teat Cup

The Universal Natural Milker has the Perfect Teat Cup. It milks just like the calf with an intermittent suction-release-massage action. It is easily and quickly assembled and taken apart without tools, and is extremely easy to keep clean. The rubber liner is absolutely seamless—cannot form pockets to hold dirt and bacteria. It can be easily cleaned without removing it from the shell. At the top of the teat cup is a rubber ring—soft, like the calf's nose, leaving no cold metal part to touch the cow.

The Alternating Action

The famous Universal alternating action, produced by the positive and uniform action of the pulsator, milks two teats while two are resting and being gently massaged. This action means a cleaner, faster job of milking with less vacuum, less power and with absolutely no strain on the cow.

Following is the tribute of one dairy authority of national repute (name sent on request), to the integrity and skill of Gillett Bros., as breeders of good dairy cattle and general good will:

"Gillett Bros. of Rosendale, Wis., are among the leading Holstein breeders in Wisconsin. W. J. Gillett, the father, was unusually active, not only in the Holstein affairs of Wisconsin, but of the nation. He has the abiding confidence of all breeders.

"We are safe in saying that no man has any better standing among Holstein breeders than Mr. Gillett. He bred good stock and dealt honestly with all people. He bred Colantha 4th's Johanna and she was for a number of years the champion dairy cow of the world. She was clearly the product of his skill and breeding as he had owned her ancestors for several generations back.

"His boys are now in active charge of this splendid breeding establishment and they are doing very good work."

March 30, 1920.

The Universal Milking Machine Co.,
Columbus, Ohio.

Gentlemen:

You will no doubt be interested to learn that we have just completed several records of note, all of which were made with the UNIVERSAL.

We have completed a record of 27.03 lbs. butter from 630.30 lbs. milk with 95.50 lbs. milk in one day on the pure-bred Holstein-Friesian, Johanna Decia No. 217925. This cow was run on hand milking for several days and was making but 23 lbs. of butter and milking around 65 lbs. milk when we decided to put the machine on her. The results are as mentioned above. An interesting feature of the record is that the member of our firm that was milking Decia by hand holds the honor of making the state milk record of 120.5 lbs. milk in one day, 833.9 lbs. in seven days. It shows that it was the machine and not poor hand milking.

Since Decia made her record we have milked all our cows by machine, and her daughter, Johanna Decia 2d at four years just made 26.08 lbs. of butter from 640.00 lbs. of milk with 95.30 lbs. her best day. Johanna Crescent at three years just made 25.64 lbs. and Johanna Paulinda 2d at 26 months made 21.45 lbs. of butter from 400.80 lbs. of milk.

We are milking all our cows with the machine and we are pleased to say the results are more than expected.

We have been looking into the machine matter for several years and after visiting herds where the different makes were used we decided on the UNIVERSAL.

We have had no trouble of any kind and every cow is in as good condition as when we first put the machine on her.

We think the UNIVERSAL is the greatest Milker on the market. We have reason to think so.

Very sincerely yours,
W. J. GILLETT & SON,
By Forrest W. Gillett.

W. J. GILLETT,
Developed the Johanna and Colantha families. Bred Colantha 4th's Johanna, the only cow to hold all world's records.

ELTON S. GILLETT,
Has fed and milked many champions including Johanna Darkness with a record of 120.5 lbs. of milk in 1 day.

FORREST W. GILLETT,
Has milked cows ofover 100-106 lbs. per day by hand. Uses and praises the Universal Natural Milker.

JOHANNA DECIA No. 217925
A record cow who produced many more pounds of milk per day on the Universal than she did under the best hand milking.

North Dakota's First Holstein Sale

The North Dakota Holstein-Friesian Breeders' Association held their first sale at Valley City, June 29th. Those in attendance participated in a banquet the evening before that was replete with good strong after-dinner talks.

Mr. T. X. Calnan, county agent of Barnes County, held down the position of toastmaster and performed his task in a very capable manner.

John Christiansen, a pioneer Holstein breeder of the state and president of the North Dakota Breeding Circuit at New Salem, gave a very interesting talk, telling of his thirty odd years as a farmer-dairyman in the country west of one hundred. The speaker stated that he and his neighbors had always been dependent upon the cow as a source of a livelihood, but that their real progress dated from the time that they finally made arrangements to purchase a carload of pure-bred Holsteins, which was distributed, a few to each one. From this small beginning the female increase was retained until the present time their herds are all practically pure-breds. The Holstein cow has enabled them to improve their buildings and the system of farming they have followed has so improved their farms that their community has become an outstanding one in the land of hard wheat.

Ex-president Taft, who chanced to be in the city, was the next speaker. He stated that he was not a breeder of Holsteins, but could qualify as a one time owner, thanks to the generosity of Uncle Isaac Stephenson, who insisted on his taking, as a White House boarder, Pauline Wayne, "a cow of royal lineage". Pauline did not produce in keeping with what might be expected of an animal so royally bred, but we were glad to hear that in the hands of a more recent owner Pauline has proved to be a good cow and an excellent producer.

President Aitkin of the National Association was then introduced and gave the principal address of the evening. He excused the seeming failure of Pauline to live up to what might be expected of her by stating it was possible that the atmosphere at the seat of the national government was not conducive to twenty-four hours of labor per day, and that Pauline, like many great men sent there, seemed to slow up and did not accomplish as much while there, as they did before they went or after they came away. President Aitkin gave an unusually strong talk, full of good thoughts that everyone could reflect on. He certainly hit from the shoulder when he said that the producer of dairy products has no right to complain or ask for cost of production plus, unless he is using the most efficient and economical machine that can be used, which means the Holstein cow.

Dairy Commissioner Osterhous followed, telling of the great strides made by the state in dairying in the last year and of his belief that the Holsteins were the logical cattle for dairy purposes in North Dakota. He then explained a recent law passed with the idea of furthering dairying, by which farmers are aided in getting long time money to finance the purchase of dairy cattle.

Although the hour was growing late, those present would not allow the meeting to close without a few words from the live wire Minnesota Secretary, Bertram D. Scott. Scott responded in his usual apt manner with words of encouragement to the members.

As to the Sale

North Dakota, having very few breeders with surplus cattle, found it a rather difficult matter to get enough consignments to stage a sale. Fifty-one head, which included three small calves, sold for $19,320, an average of $380 per head, which is very creditable considering that four figures was reached in only one instance, that being made on a double granddaughter of Sir P. O. M. 38th from the consignment of Wallace Manikowske. Floyd Caldwell of Minnesota purchased her for $1,000. The highest priced bull was a son of Sir P. O. M. 41st, that fell to the bid of Edwin Thorn, North Dakota. Thorn sure can consider himself lucky for it is not often that one has an opportunity to buy a son of 41st for that price.

While many of the cattle could have sold for considerable more money and still have been good buys, the prices received were quite satisfactory. All the cattle except five head, that went to Minnesota, remained in the state.

The sale was under the management of Everson, Scott read the pedigrees, and Mack, Krause, and Northridge did the selling.

North Dakota. A. C. GOLDTRAP.

Beware of Conditioners

The New York State College of Agriculture issues a statement with reference to stock conditioners in which it states: 'They may contain some beneficial ingredients but proportions and value in any case are a gamble. Most of the so-called stock conditioners and patent feeds, like patent medicines, contain a little of some good drug that is applicable to and beneficial for some conditions. In the general purchase and administration of these feeds, the owners of animals pay excessive prices for an uncertainty, for as a rule they know nothing about the drugs they are buying or the effect upon their animals, say the men at the state veterinary college at Cornell.

"A recent chemical analysis of several different brands of patent stock conditioners showed them to be composed largely of common salt, baking soda, Glauber's salts, copperas, charcoal, sulphur, gound barks, screenings, and a small amount of powered drugs. These are all relatively cheap substances, yet many men are engaged every year in trying to convince farmers they can treat their stock properly with these preparations rather than employ competent medical service for them."

Accredited Herds in Wisconsin

According to Dr. J. S. Healy of the Department of Agriculture, Wisconsin has passed the 300 mark in the number of Federal-State Accredited Herds and from the twelfth place in relative position among the states in January has advanced to third place at the end of July with 302 fully accredited herds. During the month of July 162 herds containing 3,590 cattle were tested; 82 of these herds passed one test without reactors and 39 herds became fully accredited.

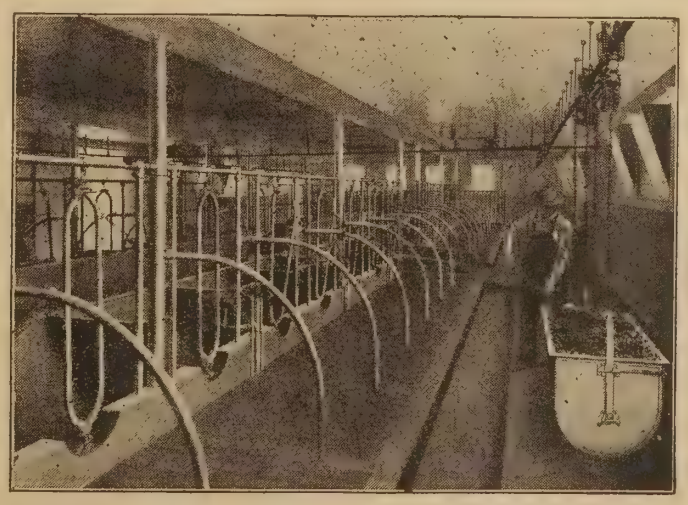
LOUDEN

Expert Barn Service Will Help You

WM. LOUDEN
Over fifty years' experience in planning and equipping barns for greater comfort, convenience, economy and profit.



This Book Shows You How to Build

Save Time, Material and Labor in Barn Building

BY CAREFULLY planning your barn building in advance you can keep down the cost. It often prevents 15% to 20% waste in lumber and a considerable loss of time and labor through misunderstandings or changes in plans after construction has started. It insures you the best possible arrangement for convenience in barn work and comfort of live stock, maximum storing and housing capacity for the money you spend, proper regard for light, ventilation, drainage, etc. Louden Expert Barn Designers and Louden Barn Plan Book take care of all these matters for you without cost or obligation on your part. Simply write us what kind of barn you have in mind, number and kind of stock you wish to house, and about when you expect to build. We will send you preliminary blueprints and suggestions to meet your individual requirements, and mail you postpaid the Louden Barn Plan Book. This book is a complete practical guide on barn building. Contains hundreds of detail drawings, also many complete barns of various styles and sizes. And after you have carefully considered the plan of constructing your barn don't overlook the labor-saving equipment that will save you valuable time in doing your daily chores.

Louden Carriers

Barn cleaning and stock feeding require less than half the usual time and labor with Louden Litter and Louden Feed Carriers. One man can really do the work of two or three. Or a boy can do the work just as well as a man. Besides this, you save many a dollar by preventing loss of manure value and waste of feed. Louden Carriers are noted for superior simplicity, safety, strength, easy operation, big capacity and durability. Carriers in daily use for 20 years are still giving good service, with little or no repairs. They can be installed in any barn without expert help. Built in different styles to meet any requirements. The biggest labor saver on any farm.

Louden Water Bowls

There is not an equipment on your farm which brings bigger returns on its cost than you can get from Louden Water Bowls. First of all, it saves all the labor of watering—cows water themselves day or night, whenever they feel the need of it. But even bigger returns come from the increased milk yield of cows. One prominent dairyman writes us that his cows are actually giving 40% more milk since he installed Louden Water Bowls. This shows that many cows really do not get all the water they need for maximum milk yield—especially in winter and after feeding time at night.

Louden Water Bowls are automatic, free from trouble-making attachments—no collar connections, no supporting lever, no set screws; can be lifted off, sterilized and reset in less than a minute. Easily installed in any barn.

Louden Equipment Helps Solve Your Labor Problem

It does in the barn what your modern crop-making machinery does in the field—enables one man to do the work of several men. You can tell Louden Equipment from any other by its plain, smooth, sturdy construction, freedom from sharp corners and trouble-making attachments, its special features of comfort and safety for live stock. Built to fit any barn old or new; easily installed; as profitable in the smallest as in the largest barns.

224-Page Catalog Shows Full Louden Line—Stalls and Stanchions; Litter, Feed and Milk Can Carriers; Bull, Cow, Calf and Hog Pens; Water Bowls, Manger Divisions, Hay Unloading Tools, Power Hoists, Barn and Garage Door Hangers, Cupolas, Ventilators—**"Everything for the Barn."** Sent postpaid; no charge or obligation.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Feeding the Dairy Calf for the Show Ring

At least half of the fun in raising a dairy calf, a pig, a garden, or an acre of corn consists in exhibiting at the fair and other shows. At least, that is the way we have it figured out. It always seems that the job is only half done if the products we raise are not put on exhibit for others to see what we have been doing during the summer months. We have often remarked before that this is one of the best ways to learn how to do a thing better than the other fellow. Because it is here that the experiences of all those engaged in a similar work are brought together to benefit all of us who care to take advantage of them.

If Jimmie Greene carried away the blue ribbon on his calf there must have been a reason for it and you are in a position while you are at the fair or show to find out what Jimmie did to make his calf so much better than yours. Of course, somebody is going to win the prize—it may be you and we hope that it is, but there is always the chance that the other fellow has something better than yours. But this is all a part of the game and it would not be very much fun in exhibiting unless we had a good, strong class to compete with. The more the merrier and we believe that Hoard's Dairyman Juniors feel the same as we do about it. A good exhibitor is a good winner and he is equally a good loser. We have great faith in our Juniors that just because they did not win a prize last year, they have not given up the idea of exhibiting a g a i n t h i s year. Persistance always makes one successful.

But we started to tell you something about fitting your calf for the show ring. Perhaps you have already been doing some of these things. Undoubtedly the older ones have because they have had this experience before. But even for them we trust that there are some things in this story which will be of benefit.

As you stroll about the stock barns on the fair grounds you often wonder why it is that so many fine cattle and calves are brought together at a place of this kind and one who is not deeply interested is inclined to think that these fine animals "just grew that way" and that they always look like this. But this is a mistake, as every experienced man or boy will tell you who has had anything to do with showing stock. A calf needs to be fitted up for the show and he also needs to know good manners. This always means a good deal of work on the part of the exhibitor and only patience will accomplish some of these things.

How to Dress for the Show

Remember the dress that your calf wears into the ring on the day he is judged will depend entirely upon you and we hope that you are doing some of these things right now and perhaps have been doing them all summer.

Every junior dairyman certainly knows that a dairy calf should not be too fat. Because dairy cattle are not naturally fat cattle and a calf that is covered with a layer of fat cannot possibly show off its dairy conformation to advantage and dairy conformation is a big point in the eyes of the judge when he has a ring full of calves to pass on. A dairy calf should be in what we call good, healthy looking condition. To fatten for the show ring is a big mistake in this class of calves. A calf of quality in good condition of flesh always shows off its dairy features better than one that is too fat.

A little oil meal fed each day helps to make the coat sleek and glossy. While this is not necessary, a glossy coat of hair adds to the general appearance of the calf. A good daily brushing with a stiff brush is one of the best things that we know of to clean the hide of a calf and to make the hair lie flat. Note that we said daily brushing. To brush occasionally may help, but it is better to make it a daily habit and I am sure you will be rewarded in a better appearance of your calf. Brushing keeps the skin clean and keeps the oil glands open.

Just before going to the show, say a few days before you expect to take your calf, it will be a good plan to give it a thorough washing with warm, soapy water. You must be careful in doing this that the calf does not take cold. We would suggest that you select a nice warm day when you can do the job outside so that the sun will help to dry him off quickly. Give him a good, thorough scrubbing and be especially careful about removing all manure stains. After washing, dry him as thoroughly as you can by rubbing with a good, clean cloth. After drying it will be a good plan to keep him blanketed. In fact, it is a good plan to keep a fine calf blanketed all during the summer months in order to keep off flies and to keep the hair in good condition. A little bluing in the water will make the white patches on your calf still whiter and we would advise this, especially when the switch of the tail is being washed out. Every calf has a right to go into the show ring with a nice, wavy switch on its tail. It is an easy matter to do this, too. After the switch has been washed and pretty well dried it can be braided tightly and then left in braids even up to the time the calf is to go into the ring, when it can be then unbraided and brushed out. This will certainly add to its appearance.

Some juniors have tried clipping on their calves to improve appearances. This is all right if you know how to do it or if you can get someone to help who does understand the business well. It is a pretty good plan to clip the tail from the switch clear up to the head. It is also a good plan in calf clipping to practice clipping the hair from underneath the belly so that the milk veins will show up better because the judge likes to look for all the possibilities in a dairy calf that go to make a good cow. Whenever clipping is practiced it should be done in such a way that the clipped surface blends very nicely with the unclipped surface so that one can hardly tell where the one leaves off and the other begins. The long hair around the top of the head, especially around the horns and the back of the neck, may also be clipped to good advantage. Clipping is not a difficult matter and with a little experience it is easy to put on a finished appearance.

If your calf has horns these should receive some attention also. All scratches in them should be removed with a little careful scraping done with the edge of a piece of glass. This will remove all of them very nicely. After that a little fine pumice stone mixed with sweet oil may be used to polish them. This can be done by putting the pumice stone on a woolen cloth and rubbing it thoroughly over the horns until they are smooth and shiny.

The fellow who expects to carry off the blue ribbon is going to do all of these things and, of course, if you are going to give him the competition he deserves you will have to do likewise.
